MAGDEBURG CENTURIES, the name given to the first comprehensive work of Protestant divines on the history of the Christian church. It was so called because it was divided into centuries, each of which occupied a volume, and because it began to be executed at Magdeburg (q.v). The originator of the work was Matthias Flacius (1552), and the purpose he had in view was to demonstrate the identity of the Protestant doctrines with those held by the primitive church, and the departures of the Roman Catholic church from the same. Joh. Wigand, Matt. Judex, Basilius Faber, Andr. Corvinus, and Thom. Holzhuter were Flacius's principal fellow-laborers; and several Protestant princes and noblemen defrayed the heavy expense incurred in the preparation of the work. The writers, who are called *centuriators*, brought their work down only to the year 1300. It was published at Basel (13 vols. 1559–74); Baumgarten and Semler began a new edition (6 vols. Nuremberg, 1758–65). The *Magdeburg Centuries* displays great learning, accuracy, and sound judgment. The Roman Catholic historian Baronius (q.v.) wrote his *Annales Ecclesiastici* as a reply to it.

MAGDEBURG HEMISPHERES are two hollow hemispheres, generally made of copper or brass, with their edges accurately fitted to each other, and one of them furnished with a stop-cock. When the edges are rubbed over with grease, pressed tightly together, and the globe thus formed exhausted of air through the cock, the hemispheres, which fell asunder before exhaustion, are now pressed together with immense force; e.g., if they are one foot in diameter, they will, after exhaustion, be pressed together with a force of nearly a ton. This experiment was first performed by Otto von Guericke (q.v.) in 1650 at the imperial diet at Ratisbon, to the astonishment of the emperor Ferdinand III. and his princes and nobles.

MAGEE, WILLIAM, D.D., 1766–1831; b. Ireland; graduated at the university of Dublin, 1785; obtained a fellowship three years after, and gave instruction while preparing for the ministry; took orders in the church of England 1790; some years after was chosen, in the university of Dublin, assistant professor of oriental languages; became senior-fellow and professor of mathematics 1806; retired from the university 1812, to the parishes of Kappagh and Killyleagh; was made dean of Cork 1814, where he excelled as a sacred orator; was appointed bishop of Raphoe 1819, and archbishop of Dublin 1822. He was a zealous Protestant and Trinitarian. Of his writings, the *Discourses on the Atonement and Sacrifice*, first published in 1811, and afterwards in many editions, have been most widely known and highly esteemed.

MAGEE, WILLIAM CONNOR, D.D., b. Ireland, 1821; educated at Trinity college, Dublin; became a curate in Dublin, and, in 1848, of St. Saviour's, Bath; incumbent of Octagon chapel, Bath, 1850; was active in organizing the church defense society; minister of Quebec chapel, London, 1860; rector of Inniskillen 1861; dean of Cork 1864; and, soon after, dean of the chapel royal, Dublin; and bishop of Peterborough 1806. Eloquent and popular as a speaker, he has preached on public occasions in different parts of Great Britain, and in the debates in the house of lords was especially active in opposing the disestablishment of the Irish church.

MAGELLAN, or (properly) **MAGALHAENS,** FERNANDO DE, a famous voyager, was born in Oporto, of good family, towards the latter half of the 15th century. He served with distinction under Albuquerque in the East Indies; but, thinking his services ill rewarded by the Portuguese court, he went, in 1517, to Spain with his countryman Ruy Falero, a geographer and astronomer. They laid before Charles V. a scheme for reaching the Moluccas by the w., which was well received by him; and Magellan sailed on Sept. 20, 1519, with 5 ships and 236 men, from San Lucar, and proceeding to the mouth of the La Plata, and along the shores of Patagonia, he discovered and sailed through the strait which bears his name; discovered the southern Pacific ocean, to which he gave that name upon account of the fine weather which he experienced there; reached the Philippine isles, and fell in a fight with the chief of the isle of Matan, April 26, 1521. His ship was safely carried home to Spain, and thus completed, Sept. 6, 1522, the first voyage ever made round the world. The complete narrative of Magellan's voyage was edited by Amoretti. See also *The First Voyage round the World by Magellan*, by lord Stanley (1875).

MAGEL'LAN, or **MAGALHAENS,** STRAIT OF, separates South America on the s. from Terra del Fuego. It is 300 m. in length; its breadth varies from 5 to 30 m.; and the

navigation is difficult. It was discovered in 1520 by Magalhaens, the Portuguese navigator, and took its name from him.

MAGELLAN, STRAIT OF (*ante*). Since steamships have been used for long voyages the strait of Magellan has acquired a new importance. On account of its fogs, precipitous shores, numerous hidden rocks, and sudden squalls, it had come to be avoided by sailing vessels, which found the circuit of cape Horn far less perilous. Careful observations, made by the steamers of many nations in its passage, have been recorded to an extent that makes it at the present time comparatively safe for steamers. Entering from the east through Desolation bay, its shores are low, reddish, and sandy. Further in, the strait varies in width from ¼ of a mile to 15 miles, and as the center is reached the shores become precipitous, conveying the impression that they had once joined, and had been parted by some great convulsion of nature. Their height varies from a few feet to many hundred, with high mountains rising behind them on the n. side, and round-topped hills on the s. or Terra del Fuego side. The most direct passage through to the Pacific is at cape Pillar, a point nearly s.w. of the entrance on the Atlantic, where lofty rocks on each side of a passage less than a mile wide form a gateway to the open Pacific. Sandy point, on the n. shore, lies about midway of the strait, and is the only settlement of whites. The Chilian government here has a penal colony. Port Famine, the scene of a sad tragedy of starvation nearly 300 years ago, lies to the west. North of the cape Pillar channel the strait opens by innumerable passages through an archipelago of barren rocky islands to the Pacific. But the channel now generally taken is an inland one from the strait on the s. by a passage known as Smyth's channel, about 350 m. long, to the stormy gulf of Penas on the n., where it connects with the open sea. The most picturesque and alpine part of the scenery of the strait is near the w. end, where lofty snow-covered ranges, cloven peaks, great glaciers, and valleys filled with somber forests, as seen from passing steamers, form a changing panorama of unique beauty. Mrs. Agassiz has described it vividly in the *Atlantic Monthly* of Jan., 1873. The scientific expedition of which Agassiz was the leader spent several months in the strait in 1871, and its reports are the fullest ever made, not only of their general features, but also of their scientific bearings. Mrs. Agassiz speaks of banks of wild fuchsias found in bloom there in March, which indicates that, however low the average temperature, the extreme, by the sea-side, is not low. Chili now claims the country contiguous to the straits, though Paraguay disputes the claim. The natives of Patagonia on the n. side and of Terra del Fuego on the s. are widely different; the former being noted for their great stature and good forms, and the latter for small size, bad forms, and degraded condition. Seals are found in abundance in the strait, but not the species bearing the most valuable fur. Besides recent works and reports on the strait already alluded to, the *Voyage round the World* by Charles Darwin, reprinted, New York, 1878; *Adventures in Patagonia*, by rev. T. Coan, 1880; and *Les Naées Magellanique*, by Duboc, Paris, 1853, are among the most instructive.

MAGENDIE, FRANÇOIS, an eminent French physiologist and physician, was b. at Bordeaux in 1783, and d. in Paris in 1855. Through the influence of his father, who practiced as a physician in Paris, he became a pupil of Boyer, the celebrated anatomist. At the age of 20, after an examination by Concours, he was appointed prosector in the faculty of medicine, and soon afterwards a demonstrator. He was subsequently appointed physician to the Hôtel-Dieu. In 1819 he was elected a member of the academy of sciences, and in 1831 succeeded Recamier in the chair of anatomy in the college of France.

Magendie's chief physiological works are: *Précis Elémentaire de Physiologie* (1816), which went through several editions, and was enlarged into the *Elémens de Physiologie*, which was translated into English, and was for many years the best work on physiology in this language; *Leçons sur les Phénomènes Physiques de la Vie* (1836–42); *Leçons sur le Sang* (1839); *Leçons sur les Fonctions et les Maladies du Système Nerveux* (2 vols. 1839); and *Recherches Philosophiques et Cliniques sur le Liquide Cephalo-rachidien ou Cerebro-spinal* (1842). He was likewise the founder, and for ten years the editor of the *Journal de la Physiologie Expérimentale*, in which are recorded many of the experiments on living animals which gained for him, too deservedly, the character of an unscrupulous vivisector.

He was the first to prove experimentally that the veins are organs of absorption; he gave a more accurate account of the process of vomiting than had been previously given; he pointed out that non-nitrogenous foods are non-nutritious, and that an animal cannot live solely on any one kind of food, however nitrogenous it may be; he investigated the physiological action and therapeutic uses of hydrocyanic acid and strychnine; he performed an important series of experiments on the cause of death when air is admitted into the larger veins; he made numerous experiments to determine the functions of various nerves and of different parts of the brain; and lastly, he shares with sir Charles Bell the honor of having discovered the separate functions of the two roots of the spinal nerves.

MAGEN'TA, an Italian town, in the province of Milan, on the high-road and railway from Novara to the city Milan, from which it is distant 12 miles. Pop. 5,100. Its district yields excellent wine and an abundance of mulberries. In the campaign of 1859

Magenta was the scene of a decisive victory won by the French and Sardinians over the Austrians. It has given its name to one of the colors derived from coal-tar. See DYE-STUFFS.

MA'GEROÉ, the most northerly of the larger European islands, belongs to Norway, and lies close to the coast of Finmark, in the Arctic ocean. It terminates on the n. in North cape, 970 ft. in height, and situated in lat. 71° 10′ n., long. 25° 50′ east. Mageroé is 22 m. in length and 15 m. in breadth, is irregular in shape, and deeply indented by bays. It supports a few Norwegian and Lappish families.

MAGGIO'RE, LAGO, one of the largest lakes in Italy, the *lacus Verbanus* of the Romans, is situated for the most part in Italy, but also partly in the Swiss canton of Ticino. It is about 36 m. in length, and its greatest breadth is about 8 miles. It lies 650 ft. above the level of the sea, and in some places is 2,500 ft. deep. The river Ticino flows through it. In a south-western expansion of the lake are the Borromean isles (q.v.). On the n. and w. it is surrounded by granitic mountains; on the s. and e. by vineyard-covered hills. See also LAGO MAGGIORE.

MAGGOT, the popular name of the larvæ of many kinds of dipterous insects, particularly those of the great family *muscidæ* (flies), although it is often also given to those of *œstridæ* (bot-flies, etc.). It is more commonly given to those larvæ which feed on animal than to those which feed on vegetable substances, and particularly to those—of which there are very many species—which feed on putrescent animal matter. *Corpse-worms* are the larvæ of *sarcophaga mortuorum*, a fly which is always ready—at least in Europe—to lay its eggs in human bodies when deposited in open vaults. Maggots of the flesh-fly (q.v.) are used to feed pheasants and as fish-bait, and to procure them in abundance, dead bodies of animals are often exposed to putrefaction in the open air.

MAGHADA, one of the kingdoms of India when Alexander the great invaded the country, B.C. 400. It comprised the greater part of southern and central India, and lasted till about A.D. 450. Its capital was Palibothra on the Ganges, and is supposed to have occupied the site of the present Patna. Seleucus, one of Alexander's generals, to whom Bactria was given, which included the provinces on the Indus, attempted conquests beyond that river, and was involved in war with Chandragupta, king of Maghada, called by the Greeks Sandracottus, 312–280. His grandson Asoka, B.C. 250, extended his empire and the Buddhist religion over the larger part of India.

MA'GI. The origin of this term has recently been brought to light by Assyrian scholars. In Accadian, the language of the early Scythian or Turanian inhabitants of Babylonia and Media, *imga* signifies "august," "reverend," and was the title of their learned and priestly caste. These Accadians had made great advances in astronomy, or rather astrology, and were much addicted to divination and similar mysterious arts. The Semitic nations, afterwards dominant in Babylonia and Assyria, adopted not only the learning and many of the religious observances of the early inhabitants, but also a number of the special forms, and among others the name for the learned caste, modifying it to suit their own articulation; and out of the Semitic form the Greeks made *magos*. Under the Persian empire the magi rose to the very highest importance. They were not only the "keepers of the sacred things, the learned of the people, the philosophers and servants of God," but also diviners and mantics, augurs and astrologers. They called up the dead, either by awful formulas which were in their exclusive possession, or by means of cups, water, etc. They were held in the highest reverence, and no transaction of importance took place without or against their advice. Hence their almost unbounded influence in private as well as in public life, and, quite apart from the education of the young princes being in their hands, they also formed the constant companions of the ruling monarch. Of their religious system itself, the articles GUEBRES and PARSEES will give a fuller account. Zoroaster (q.v.), *Zerdusht*, reorganized, in the course of his great religious reform, also the body of the magi, chiefly by reinforcing the ancient laws about their manner and mode of life, which was to be one of the simplest and severest, befitting their sacred station, but which had become one of luxury and indolence, and by reinstituting the original distinction of the three classes of *herbeds* (disciples), *mobeds* (masters), and *destur mobeds* (complete masters). The food, especially of the lower class, was to consist only of flour and vegetables; they wore white garments, slept on the ground, and were altogether subjected to the most rigorous discipline. The initiation consisted of the most awful and mysterious ceremonies. Purifications of several months' duration had to precede it, and it was long before the stage of the disciple's "being led into the realms of the dead" was proceeded with.

Gradually, however, their influence, which once had been powerful enough to raise them to the throne itself (Sassanides), began to wane, and if formerly a number of 80,000 delegates of magi had to decide on the affairs of state and religion, this council in later times dwindled down to the number of seven; and from being the highest caste, the priests of God, and the "pure of mind, heart, and hand," they fell to the rank of wandering jugglers, fortune-tellers, and quacks, and gave the name to the art of sleight-of-hand and performance of conjuring tricks.

MAGIC (see article MAGI) is a general name for wonderful effects produced in some mysterious way. Medicine in its early form is intimately allied to magic. It would soon be discovered by accident that certain plants produced powerful effects, both good and bad, upon the bodies of men and animals; and the reverence arising from their real virtues would lead to ascribing to them all manner of imaginary ones. The laws of nature being little known, one thing was not more incredible than another; and effects were assigned to causes in the most arbitrary and accidental way. The Rosicrucian physicians treated a case of wounding by applying the salve to the weapon instead of to the wound itself; and this may be taken as the type of magical as contrasted with rational medicine. In modern times drugs are mostly drawn from the mineral and vegetable kingdoms; but while the healing art was in the mystic stage, animal substances were most esteemed. If the juice of a plant could affect the living body, how much more must the life-blood of another animal! And the rarer the kind of blood, so much the rarer the virtue. The blood of an innocent child, or of a virgin, was believed to cure the leprosy; that of an executed criminal, the falling sickness. The hearts of animals, as being the seat of life, were held to be potent drugs. The fat of a hog had been found by experience to benefit a sore; what virtue, then, must there be in human fat, with the solemn mysteries of the grave about it!

In early stages of society women are the doctors; while the men fight and hunt, the women gather herbs and decoct salves for their wounds; and the art would naturally become a sort of profession in the hands of the older women who had a reputation for superior skill of that kind. Mostly a blind groping—a mystery to themselves as well as others—their operations were looked upon with awe. The "wise woman" with her kettle, cooking her mysterious broth, adding ingredient after ingredient (for the more, the rarer, the horribler they were, would not the compound be the more efficacious?), inspired not only hope but fear; for the art might be, and doubtless was, used to hurt as well as to heal. Roman matrons were often accused and convicted of poisoning by their decoctions; and during seasons of pestilence these female druggists were persecuted with indiscriminate fury, as were witches afterwards in Europe. So much was the notion of poisoning uppermost in the Roman mind respecting them that *venefica*, literally "a poison-maker," was the general name for a preparer of magic medicines, an enchantress or sorceress—the corresponding character to our witch. See WITCHCRAFT.

The operation of magical medicines was not, as is the case with those of the modern pharmacopœia, confined to physical effects on living bodies to which they were applied; associated with incantations and other ceremonies, as they always were, they could be made to produce almost any desired effect—raise or lay storms; fertilize a field, or blast it; kill or cure a man, absent as well as present; and give the power of predicting future events. How a belief in imaginary virtues of things may grow out of the experience of their real virtues is indicated by Dr. Livingstone, when speaking of the belief in rain-making among the tribes in the heart of southern Africa. The African priest and the medicine-man is one and the same, and his chief function is to make the clouds give out rain. The preparations for this purpose are various—charcoal made of burned bats; internal parts of animals, as lions' hearts and hairy calculi from the bowels of old cows; serpents' skins and vertebræ; and every kind of tuber, bulb, root, and plant to be found in the country. "Although you disbelieve their efficacy in charming the clouds to pour out their refreshing treasures, yet, conscious that civility is useful everywhere, you kindly state that you think they are mistaken as to their power; the rain-doctor selects a particular bulbous root, pounds it, and administers a cold infusion to a sheep, which in five minutes afterwards expires in convulsions. Part of the same bulb is converted into smoke, and ascends towards the sky; rain follows in a day or two. The inference is obvious." The religion of this part of Africa may be characterized as medicine-worship. In a village of the Balonda, Dr. Livingstone saw two pots with charms or medicines kept in a little shed, like idols in a niche. For an idol they sometimes take a piece of wood, and carve a human head on it, or simply a crooked stick, when there is no professed carver to be had; but there is nothing divine about it until it is dotted over with a mixture of medicine and red ocher. Packets of medicine are worn as charms about the person, to ward off evils of all kinds. The female chief Manenko was hung all over with such charms; and when she had to cross a river, her traveling-doctor waved medicines over her, and she took some in her hand, to save her from drowning.

During the middle ages, and down almost to the 18th c., magic was greatly studied in Europe, and could boast of distinguished names, who attempted to treat it as a grand and mysterious science, by means of which the secrets of nature could be discovered, and a certain godlike power acquired over the "spirits" (or, as we should now say, the "forces") of the elements. The principal students and professors of magic during the period referred to were pope Sylvester II., Albertus Magnus, Roger Bacon, Raymond Lully, Pico della Mirandola, Paracelsus, Cornelius Agrippa, Trithemius, Van Helmont, and Jerome Cardan. See Horst's *Von der Alten und Neuen Magie, Ursprung, Idee, Umfang und Geschichte* (Mentz, 1820); and Ennemoser's *Geschichte der Magie* (2d ed. Leip. 1844; translated into English by W. Howitt, 2 vols. Lond. 1854). For an interesting account of the discipline and ceremonies of the "art," consult the *Dogme et Rituel*

de la Haute Magie (Paris, 1856), by Levi; and *Histoire de la Magie*, by Christian (Paris, 1870).

Some of the different forms which the belief in magic has assumed will be seen under AMULET, AUGURIES AND AUSPICES, DIVINATION, INCANTATION, and WITCHCRAFT, and the allied subjects of ALCHEMY and ASTROLOGY.

MAGIC LANTERN, an optical instrument by means of which magnified images of small pictures are thrown upon a wall or screen. The instrument consists of a lantern containing a powerful argand lamp; in the side of the lantern is inserted a horizontal tube, on a level with the flame, and the light is made to pass through the tube by reflection from a concave mirror placed on the opposite side of the lantern. The tube is furnished with two lenses, one at each end; the inner one is a hemispherical illuminating lens of short focus, to condense a strong light on the picture, which is inserted into the tube, between the lenses, through a transverse slit. The other end of the tube is fitted with a double convex lens, which receives the rays after passing through the picture, and throws them upon the screen or wall. The pictures are formed with transparent varnish on glass slides, and must be inserted into the tube in an inverted position, in order that the images may appear erect. If the screen on which the image is thrown be at too great a distance, the image will become *indistinct* from the lessened intensity of the light, and *distorted* by the increasing spherical and chromatic aberration, though this latter defect may be obviated by the use of a screen of the same curvature as the outside surface of the lens. This instrument is generally used as a toy, but is also occasionally employed to produce enlarged representations of astronomical diagrams, so that they may be well seen by an audience. Phantasmagoria, dissolving views, etc., are produced by a particular manipulation of the same instrument.

MAGIC SQUARES, a species of puzzle which occupied the attention of many celebrated mathematicians from the earliest times down to the 18th century. The magic square is a square divided by lines parallel to the sides into a number of smaller equal squares or cells, in which are inserted numbers which form the terms of one or more progressions (generally arithmetical), in such an order that each line of numbers, whether added horizontally, vertically, or diagonally, shall amount to the same sum. This arrangement is effected in three different ways, according to the number of cells in the side of each square, and can be most easily effected when this number is *odd*, or *evenly even* (divisible by 4), but becomes a problem of considerable difficulty when the number of cells is *oddly even* (divisible by 2, and not by 4). The following are examples of the first two methods:

13	3	2	16
12	6	7	9
8	10	11	5
1	15	14	4

9	2	25	18	11
3	21	19	12	10
22	20	13	6	4
16	14	7	5	23
15	8	1	24	17

The arrangement for the oddly even squares is the same as that for the evenly even ones, with the exception of a few transpositions. The only exception is when the number of squares or cells is four. Dr. Franklin invented a similar puzzle to this, called the "magic circle." See *Hutton's Recreations in Mathematical Science*, vol. i.

MAGILP', or MEGGELLUP, a composition used by artists in oil-colors as a vehicle for their "glazes." It is made of linseed oil and mastic varnish, and is thinned with turpentine as required for the painting.

MA'GILUS, a very curious genus of gasteropodous mollusks, of the order *tubulibranchiata*, inhabiting the Red sea and the Indian ocean. They have, at first, shells of the ordinary form of spiral univalves, and establish themselves in little hollows of madrepores, where they remain, enlarging the shell into a long tube as the madrepore grows, and thus preventing themselves from being shut in. The tube is sometimes 3 ft. long, and the animal deserts entirely the spiral part of the shell, and lives in the mouth of the tube, which it closes against danger by an operculum, the upper part being wholly or partially filled up with solid matter.

MAGINDANAO, or MINDANAO. See PHILIPPINE ISLANDS, *ante*.

MAGINN', WILLIAM, LL.D., 1793–1842; b. in Cork, Ireland, d. at Walton on Thames, near London. In youth he had such precocity of talent that he was admitted to Trinity college at the age of ten. He became a valued contributor to *Blackwood's Magazine;* a Paris correspondent in 1824; editor of the *London Standard* in 1828; of

Fraser's Magazine in 1830; of the *Lancashire Herald* in 1839, and the *Magazine of Miscellanies* in 1840; and was an occasional contributor to the *Quarterly Review, Bentley's Miscellany,* and *Punch.* His style was noted for its brilliancy and wit. A collection of his works was published in the United States, 1855–57, in 5 vols., edited by Dr. R. S. Mackenzie.

MAGISTRATE. See JUSTICE OF the PEACE.

MAGLIABECHI, ANTONIO DA MARCO, an Italian scholar of extraordinary attainments, and court librarian, b. at Florence in 1633, of a respectable but indigent family. From his earliest years he displayed an inordinate passion for the acquisition of book-knowledge. Having speedily mastered the Greek, Latin, and Hebrew languages, he literally entombed himself among books, of which disorderly piles encumbered every portion of his dwelling, and lay in a heterogeneous litter around his feet. In his daily habits Magliabechi grew regardless of the requirements of social and sanitary life; and such was his avidity of study that he finally denied himself even the requisite intervals of repose. His memory was prodigious, and not only enabled him minutely to retain the contents of his multitudinous books, but also to supply, on occasion, the most exact reference to any particular page or paragraph, the place of each book being indicated with precision in the midst of their apparent inextricable masses. Magliabechi was regarded as the literary prodigy of his times. He was appointed court-librarian by the grand dukes of Florence; and the many tributes of respect tendered by royal and distinguished personages to his wonderful erudition, fostered in an inordinate degree his love of fame and praise, which rendered him intolerant of literary merit in others, and involved him in several bitter literary squabbles. He died at Florence on July 12, 1714, in the 81st year of his age, leaving no written record of his immense encyclopædic knowledge. His valuable library of 30,000 vols. he bequeathed to his native city of Florence, with funds for its future care and extension; it is now a free library, and bears the name of its collector.

MAGNA CHARTA, the great charter which was granted by king John of England to the barons, and has been viewed by after-ages as the basis of English liberties. The oppressions and exactions of a tyrannical and dastardly sovereign called into existence a confederacy of the barons or tenants-in-chief of the crown, who took up arms for the redress of their grievances. Their demand was for the restoration of the laws of Henry I., laws which might probably be characterized as an engrafting of Norman feudalism on the "ancient custom of England," or previously existing Saxon and Danish free institutions, in which "ancient custom" were comprehended the laws of Edward the confessor. A conference between the sovereign and the barons was held at Runnymede, near Windsor, a place where treaties regarding the peace of the kingdom had often before been made. King and barons encamped opposite each other; and after several days' debate John signed and sealed the charter with great solemnity on June 15, 1215.

The great charter reared up a barrier against the abuse of the royal prerogative by a series of provisions for the protection of the rights and obligations of the feudal proprietor. It redressed a variety of grievances connected with feudal tenures, some of them now so long obsolete as to be with difficulty intelligible. There are minute provisions regarding the relief of heirs, wardship, marriage of heirs and of their widows. No scutage or aid is to be imposed without the authority of the common council of the kingdom, except on the three great feudal occasions of the king's captivity, the knighting of his eldest son, and the marriage of his eldest daughter. The liberties of the city of London and other towns, boroughs, and ports are declared inviolable. Freedom of commerce is guaranteed to foreign merchants. Justice is no longer to be sold, denied, or delayed. The court of common pleas, instead of, as formerly, following the king's person in all his progresses, is to be permanently fixed at Westminster; assizes are to be held in the several counties, and annual circuits are established. Regulations are made for the efficiency of the inferior courts of justice. The protection of life, liberty, and property from arbitrary spoliation is the most important feature of the charter. "No freeman shall be taken or imprisoned, or be disseized of his freehold, or liberties, or free customs, or be otherwise damaged, nor will we pass upon him, nor send upon him, but by lawful judgment of his peers, or by the law of the land"—a provision which recognized a popular tribunal as a check on the official judges, and may be looked on as the foundation of the writ of habeas corpus. No one is to be condemned on rumors or suspicions, but only on the evidence of witnesses. Protection is afforded against excessive amercements, illegal distresses, and various processes for debts and services due to the crown. The fines imposed are in all cases to be proportioned to the magnitude of the offense, and even the villein or rustic is not to be deprived of his necessary chattels. There are provisions regarding the forfeiture of lands for felony. The testamentary power of the subject is recognized over part of his personal estate, and the rest is to be divided between his widow and children. The independence of the church is also provided for.

These are the most important features of that charter which occupies so conspicuous a place in history, and which establishes the supremacy of the law of England over the will of the monarch. A charter was at the same time granted to mitigate the oppressions of the forest laws (q.v.). The terms dictated by the barons to John included the sur-

render of London to their charge, and the Tower to the custody of the primate till August 15 following, or till the execution of the several articles of the great charter. Twenty-five barons, as conservators of the public liberties, were invested with extraordinary authority, which empowered them to make war against the sovereign in case of his violation of the charter. Several solemn ratifications were required by the barons both from John and from Henry III.; and a copy of the great charter was sent to every cathedral, and ordered to be read publicly twice a year. The copy preserved in Lincoln cathedral is regarded as the most accurate and complete; and a fac-simile of it was engraved by order of the late board of commissioners on the public records. The great charter and charter of the forests are printed with English translations, and prefixed to the edition of the statutes of the realm published by the record commission.

MAGNA GRÆCIA (Gr. *Hē Megalē Hellas*), the name given in ancient times to that part of southern Italy which was thickly planted with Greek colonies. When it first obtained this appellation is unknown, but it must have been at an early period. Polybius says it was so called in the time of Pythagoras. Some writers include under the term the Greek cities in Sicily; others restrict it to those situated on the gulf of Tarentum, but in general it is used to denote all the Greek cities in the south of Italy, exclusive of those in Sicily. The oldest settlement is believed to have been Cumæ—though it is doubtful whether it and its colonies, Dicæarchia and Neapolis, were really embraced under the designation Magna Græcia; while the period assigned to its foundation—viz., soon after the Trojan war—is obviously fanciful. If we fix about the 8th or 9th c. before Christ, we will perhaps not be far wrong. Of the other Greek settlements in Italy—most, if not all of which were later than those in Sicily—the earliest was Sybaris (founded by the Achæans, 720 B.C.); next, Croton (by the Achæans, 710 B.C.); then Tarentum (by the Spartans, 708 B.C.); Locri (by the Locrians, 708 B.C., according to others, 30 or 40 years later), Rhegium (by the Chalcidians; date of origin not known, but believed by some to be older than even Sybaris), Metapontum (by the Achæans, 700–680 B.C.), and Velia (by the Phocæans, 540 B.C.). These cities became, in their turn, the parents of many others.

Of the earlier history of Magna Græcia we know almost nothing. The settlements appear to have risen rapidly to power and wealth, partly by the brisk commerce which they carried on with the mother-country, and partly also, it is conjectured, by an amalgamation with the Pelasgic (and therefore kindred) natives of the interior. This, we are told by Polybius, actually happened at Locri, and most probably elsewhere also. About the year 530 B.C. Pythagoras the philosopher arrived at Crotona, and soon acquired an influence in Magna Græcia which was quite wonderful, though it did not last long. The quarrels between the different cities were often bitter and bloody; and finally, 272–271 B.C., the Romans conquered the whole of Lower Italy.—Long before this several of the cities had disappeared. Sybaris, for example, was destroyed by the Crotonians as early as 510 B.C., and now the rest more or less rapidly sunk into decay, and were, in the time of Cicero, with a few exceptions, reduced to utter ruin.

MAGNAN, BERNARD PIERRE, 1791–1865; b. Paris; son of a notary; entered the army in 1809, and served under Napoleon till the defeat at Waterloo; lieut.col. in the campaign in Spain 1823–27; was in the expedition to Algiers in 1830. Censured for lack of energy in dealing with an insurrection in Marseilles in 1831, he entered the service of Belgium as gen. of brigade; in 1839 returned to France; was implicated in the first attempt of Louis Napoleon to make a rising of the people in his favor at Boulogne; in 1848 tendered his services to Louis Philippe after his dethronement, but was energetic in bringing the army of the Alps to Paris in June of that year to repress a formidable insurrection under the republic, and another at Lyons in 1849. He allied himself with Louis Napoleon when president of France, and was his efficient instrument in overthrowing the republic by the treacherous *coup d'état* of Dec. 2, 1852, which made Napoleon emperor. The emperor made him a grand marshal of France.

MAGNE, PIERRE, 1806–78, b. France; was employed when a young man by the prefect of Dordogne; and afterwards pursued the study of jurisprudence at Toulouse. Returning to Périgueux, his native place, he entered upon the practice of his profession. His talents did not escape the notice of the government, which made him, in 1835, a councilor to the prefecture of the Dordogne. He was elected to the chamber of deputies in 1843, and soon came to be considered an authority in its financial discussions, in which he took part as a member of the committee on the budget. He became an under-secretary in the war department in 1847, but resigned upon the outbreak of the revolution in 1848, and retired to Périgueux, whence, the following year, he was recalled to take the place of under-secretary in the ministry of finance. He was transferred to the department of public works in 1850. He withdrew from the cabinet in consequence of the dissension among its members in regard to the confiscation of the estates of the Orléans family. He was chosen senator in 1852, and in July of that year re-entered the cabinet, in his old position as minister of public works. In 1853 he was appointed minister of commerce and agriculture, and in 1855 minister of finance. His knowledge of and talent for finance were remarkable, and though he occasionally resigned or was transferred to some other department, on account of his inability to agree with his colleagues, or to carry out some favorite financial scheme, he was always sure to be recalled.

He was out of office from 1863 to 1867, when he was re-instated as the only man who could successfully place the great loan, whose negotiation France was then contemplating. When Émile Ollivier was invited by the emperor, Dec. 27, 1869, to form a new ministry, Magne went out of office; and his place was taken by M. Buffet. He returned to the treasury when the duc de Broglie took office, April 24, 1873, and went out with the de Broglie ministry, May 16, 1874. At the time de Broglie formed his cabinet, Magne was serving in the national assembly, to which he had been returned from the department of the Dordogne. His last public office was that of a senator for the Dordogne, to which office he was elected in 1876.

MAGNENTIUS, FLAVIUS POPILIUS, Roman emperor of the west. He was of barbarian extraction, but soon rose to the rank of count under the emperor Constantine the great. Entering the service of Constans, son of Constantine the great, emperor of the west, he was put in command of the troops that defended the Rhine, and plotted the overthrow of that prince. With the aid of Marcellinus, count of the sacred largesses, his plot was successful. Marcellinus having invited the officers of the army, stationed near the city of Autun, to a banquet in honor of the birthday of his son, at a late hour introduced Magnentius arrayed in robes of royalty. The cry "Long live Augustus" was raised by several conspirators, Constans was assassinated, and Magnentius took possession of the palace at Autun. In a short time Gaul, Italy, and most of the western provinces, acknowledged the usurper as emperor. Constantius, the brother of Constans, and emperor of the east, hastened to avenge the death of his brother, and totally defeated Magnentius before the town of Mursa on the Drave, 351. He fled to Italy, thence to Gaul, where Constantius followed him, and again in 353 defeated him in the Cottian Alps. On the eve of being captured by his enemies, and deserted by the countries that had acknowledged him, he committed suicide at Luddunum, Aug., A.D. 353. Constantius thus became master of the whole empire.

MAGNESIA. See MAGNESIUM.

MAGNESIA, a district of Thessaly, Greece, the narrow and mountainous portion between the river Peneus and the Pagasæan bay to the n. and s. and between the chain of Ossa and the sea on the w. and east. The Magnesians submitted to Xerxes, but afterwards were subdued by the kings of Macedon, who succeeded Alexander, and were declared free by the Romans after the battle of Cynoscephalæ. Their government was then republican.

MAGNESIA, the name of two ancient cities of Asia Minor. The first was in the northern part of Lydia, near the Hermus, at the foot of Mt. Sipylus, and was called *Magnesia near Sipylus*, to distinguish it from the other. Its founder and early history are not known, but it was first brought into notice by the victory of the Romans over Antiochus the great, in 187 B.C. It was one of the 12 cities destroyed by the earthquake in the time of Tiberius, which he soon rebuilt. It is now Manissa. The second was in Caria on the river Lethæus in the valley of the Mæander, and called *Magnesia at the Mæander*, to distinguish it from that near Mt. Sipylus. It was 15 m. from Ephesus. It had a famous temple of Diana, the remains of which Hamilton discovered in exploring the ruins of the city.

MAGNESIAN LIMESTONE. See DOLOMITE.

MAGNESIUM (symb. Mg. eq. 12—new system, 24—sp. gr. 1.74) is generally ranked with those metals whose oxides form the alkaline earths (baryta, strontia, lime), but in many respects it more closely resembles zinc. It is a malleable, ductile metal, of the color and brilliancy of silver. It fuses at about the melting-point of tin (about 442°), and at an extreme heat it may be distilled like zinc. When ignited in dry air or in oxygen gas, it burns with extraordinary brilliancy, and is oxidized into magnesia. In dry air it undergoes little change, and is much less oxidizable than the other metals of the same group. It does not decompose cold water; but if the water be heated to about 90°, there is a slight evolution of hydrogen; and if the temperature is raised to 212°, hydrogen is given off rapidly and abundantly. When thrown into strong hydrochloric acid, it inflames and becomes converted into chloride of magnesium, while hydrogen is given off.

It is obtained from its chloride either by the action of sodium or potassium, or by simple electrolytic decomposition; but the ordinary processes are difficult, and yield the metal only in minute quantities. A patent has, however, been taken out by Mr. Sonstadt for improvements in its manufacture, by which it can be produced by the pound.

Magnesia (MgO) is the only oxide of magnesium. It is a white bulky powder, devoid of taste or smell, and having a sp. gr. of 3.65; it is infusible, and almost insoluble in water; and when placed on moistened test paper, is seen to have an alkaline reaction. When mixed with water, it gradually forms a hydrate (MgO,HO), without, as in the case of lime, any sensible elevation of heat, and this hydrate slowly absorbs carbonic acid from the atmosphere. Magnesia does not occur native, and is usually obtained by the prolonged application of heat to the carbonate. Hydrate of magnesia occurs naturally in a crystalline form in the mineral brucite.

Magnesia alba, the common white magnesia of commerce, is a mixture of the hydrate of magnesia and of hydrated carbonate. It is obtained by the precipitation of a hot

solution of sulphate of magnesia by a hot solution of carbonate of potash or soda, and by then collecting and drying the deposit.

Of the *magnesian salts*, some are soluble and some insoluble in water. The soluble salts have a peculiar and very bitter taste, and hence the German name, *bittererde* (bitter-earth), for magnesia. All the salts which are insoluble in water, except the silicate, dissolve in hydrochloric and nitric acids.

Carbonate of magnesia occurs native in the mineral *magnesite*, and in association with carbonate of lime in *dolomite*, from which it may be manufactured in a very pure state by Mr. Pattinson's process, which consists essentially in the following steps: Finely ground dolomite is exposed for some time to a red heat, by which the carbonate of magnesia is decomposed; the powder is then introduced into a very strong vessel, where it is mixed with water, and carbonic acid gas forced in under heavy pressure till it ceases to be absorbed; the carbonate of magnesia becomes dissolved as bicarbonate, while the carbonate of lime remains unchanged; on boiling the clear liquid, carbonate of magnesia is deposited, and carbonic acid expelled.

Sulphate of magnesia, or *Epsom salts* (MgO,SO_3+7Aq), is the most important of the magnesian salts. It is obtained from sea-water, or from magnesian limestone (dolomite), or from the mother-liquor of alum-works, by processes into which we have not space to enter, and is a common ingredient in mineral waters (see EPSOM SALT). It is soluble in three times its weight of water at 60°, and in less water at a higher temperature, the solution having a bitter, disagreeable taste.

Nitrate of magnesia (MgO,NO_5+6Aq) occurs in certain mineral waters, but is of no special importance.

A *phosphate of magnesia*, having the formula $HO,2MgO,PO_5+14Aq$, is obtained by the mixture of solutions of sulphate of magnesia and of ordinary phosphate of soda. It occurs either in an amorphous state or in six-sided prisms, according as the solutions are more or less concentrated. This salt is a constituent of the seeds of wheat and the other cereals, of bones, and of various morbid concretions. The *phosphate of ammonia and magnesia*, known also as *ammoniaco-magnesian phosphate* and as *triple phosphate* ($NH_4O,2MgO,PO_5+12Aq$), is a more important salt than the preceding. It occurs either in minute crystalline grains or in beautiful transparent four-sided prisms of considerable size, and with a very characteristic appearance. The formation of the salt, which is only slightly soluble in pure water, and is quite insoluble in water containing free ammonia or its hydrochlorate, not only furnishes a very delicate test for the presence of magnesia, but enables us to determine its quantity.

This phosphate of ammonia and magnesia is readily formed by mixing a solution of a magnesian salt with hydrochlorate of ammonia, phosphate of soda, and a little free ammonia. It is an occasional constituent of urinary calculi, and crystallizes in beautiful prisms from urine and other animal fluids, when they begin to putrefy. It is also frequently present in the excrements in cases of diarrhea.

The *silicates of magnesia* are numerous. A large number of minerals are formed either wholly or partly of them, among which may be mentioned olivine or chrysolite, talc, steatite or soapstone, meerschaum, serpentine, augite, hornblende, etc.

The haloid salts of magnesium—the chloride, iodide, and bromide—are of no special interest, except that the chloride of magnesium is, next to chloride of sodium, the most abundant of the salts existing in sea-water.

The compounds of magnesium employed in medicine are magnesia, its carbonate, and its sulphate.

Magnesia is presented in small doses (from 10 grains to a scruple), as an antacid, in cases of undue acidity of the stomach, heart-burn, and abnormal acidity of the urine; in larger doses (from a scruple to a dram), it produces distinct purgative effects. It is useful, especially when combined with rhubarb and a little ginger (in the form of compound rhubarb powder or Gregory's mixture), as a purgative for children, in acid conditions of the alimentary canal.

Carbonate of magnesia (magnesia alba) acts in the same manner as magnesia, except that it is less active, since more than half of it consists of water and carbonic acid. Dinneford's solution of magnesia, and other fluid preparations of the same nature, are made by dissolving this salt in water charged with carbonic acid. A dram of carbonate of magnesia, the juice of one lemon, and a wine-glassful of water constitute an agreeable laxative, a citrate of magnesia being thus formed.

Sulphate of magnesia is a purgative in very general use. It is much employed in febrile affections, and when the portal system is congested; but it may be used in almost any case in which a mild but efficient laxative is required. Its dose varies from 2 to 4 or 6 drams. In combination with the infusion of senna, it forms the ordinary *black draught*. See MAGNESIUM AND THE MAGNESIUM LIGHT.

MAGNE'SIUM AND THE MAGNESIUM LIGHT. Although the discovery of the metal magnesium was made by sir H. Davy in 1808, it was looked upon as little more than a chemical curiosity for about half a century. In 1830 a French chemist, Bussy, obtained globules of the metal by fusing globules of potassium, in a glass tube, with anhydrous chloride of magnesium. Bussy's labors were followed by somewhat improved methods, adopted by Bunsen, and subsequently by Matthiessen, who succeeded in pressing some

grains of the metal into wire. The first great advance on Bussy's labors was in 1856, when Deville and Caron effected the reduction of the pure chloride of magnesium by mixing it with fused chloride of sodium in clay crucibles, using fluoride of calcium as a flux, and throwing in fragments of sodium; they thus obtained magnesium on a larger scale than any of their predecessors. The most important part of their investigations was the discovery of the volatility of the metal. All these were, however, mere laboratory experiments. In 1859 Bunsen of Heidelberg, and Roscoe (now of Manchester), published a memoir on the great importance of magnesium for photographic purposes, owing to the high refrangibility and the great actinic power of the light emitted by burning magnesium-wire. The study of this memoir led Mr. Sonstadt to consider whether, the magnesian salts being so abundant, the metal might not be obtained, on a comparatively large scale, at a moderate price. After a prolonged series of expensive experiments he succeeded, in 1862, in producing specimens of the metal varying from the size of a pin's head to that of a hen's egg. Although it burned freely enough, it was still wanting in ductility and malleability, in consequence of the presence of certain impurities; but by May, 1863, these difficulties were overcome by a process of purification by distillation; and by the close of that year he considered it safe to begin manufacturing. The magnesium metal company was consequently organized, and operations commenced at Manchester, where magnesium is now made on a considerable scale, as well as by an American magnesium company at Boston. One great advantage of Sonstadt's method is its simplicity; it can be accomplished by the hands of ordinary workmen ignorant of all chemical knowledge. The process of manufacture may be thus described: 1. An anhydrous chloride of magnesium is prepared by saturating lumps of rock-magnesia (carbonate of magnesia) with hydrochloric acid, and then evaporating the solution to dryness. 2. One part of metallic sodium cut in small pieces is placed in an iron crucible, and covered with five parts of the chloride. The crucible is covered, and heated to redness, when the chlorine leaves the magnesium and unites with the sodium, for which it has a stronger affinity. When the crucible has cooled, and its contents are removed *en masse*, and broken, the magnesium—in that state known as crude magnesium—is seen in nuggets of various sizes, varying from granules to masses as large as a hen's egg. 3. The distillation of the crude metal is effected in a crucible through which a tube ascends to within an inch of the lid. The tube opens at the bottom into an iron box, placed beneath the bars of the furnace, where, on the completion of the operation, magnesium is found in the form of a heap of drippings, which may be melted and cast into ingots or any desired form. The difficulty of obtaining a metal with so little ductility in the form of wire—the only form that was originally used for yielding light—had still to be overcome; and after various partially successful attempts to press small quantities into wire by Matthiessen and others, Mr. Mather of Salford devised a piece of machinery by which the metal is pressed into wire of various thickness. Mr. Mather also was the first who obtained the metal in ribbons, in which form, from the larger exposed surface, combustion takes place more completely. The apparatus for making the wire and ribbon is very ingenious. "The chief feature of it is a small hollow cylinder, adapted to receive a ram at one end, and covered at the other by an iron screen perforated with two or more holes opposite the chamber. This press, as the cylinder is called, is subjected to the action of gas from a blow-pipe, and the heat employed is only sufficient to soften the metal in the press. The pieces of magnesium are thrust into the chamber, the ram is placed in the mouth of the press, and a pressure of between two and three tons—obtained by hydraulic apparatus or by steam—forces the ram against the softened metal, and the latter oozes in continuous strings of wire through the perforations already named. To make ribbon, the wire thus obtained is passed between two hollow heated rollers, and is received in a flattened state upon a reel."—*Richardson & Watts's Chemical Technology.* To Mr. Mather is also due the credit of having constructed the first magnesium lamp, in which the end of the wire or ribbon is presented to the flame of a spirit-lamp. A concave reflector sent the light forward, and protected the eyes of the operator.

The first time that a photograph was taken by this light was at Manchester in the spring of 1864 by Mr. Brothers and Dr. Roscoe. That the magnesium light, in a more or less modified form, must prove of extreme value to photography cannot be called in question. Besides overcoming the obstacle of unsuitable weather for the employment of sunlight, it may be applied both for the exploration and the photography of various dim structures, underground regions, etc., such as the interior of the pyramids, of catacombs, natural caverns, etc., which could not otherwise be examined or photographed. Prof. Piazzi Smyth, the Scottish astronomer-royal, dating from the east tomb, great pyramid, Feb. 2, 1865, writes as follows: "With any number of wax candles which we have yet taken into either the king's chamber or the grand gallery, the impression left on the mind is merely seeing the candles and whatever is very close to them, so that you have small idea whether you are in a palace or a cottage; but burn a triple strand of magnesium wire, and in a moment you see the whole apartment, and appreciate the grandeur of its size and the beauty of its proportions." M. Madar is said to have taken a series of photographs of the catacombs of Paris; various artists are busy practicing on monuments in obscure recesses of continental churches; and in different parts of England caves of prehistoric interest either have been, or are about to be, photographed by this

light. For portraiture, it is found to be less successful than was at first expected, owing to the intense light within a few feet of the sitter's eyes causing a contraction of the facial muscles.

Objectors to the application of such lights for the lighting of large buildings and thoroughfares maintain that, while light derived from oil or coal-gas, in which carbon constitutes the ignitible solid, possesses a power of diffusibility which renders objects not directly opposed to the course of the rays more or less distinctly visible, the electric, lime, and magnesium lights possess less of this diffusiveness; their rays being apparently projected with a force and velocity which interfere with the power of diffusion. An object placed in the direct course of the rays is splendidly illuminated, and the rays are projected to an immense distance; but the shadows cast by intervening objects are intensely black, and the rays seem to pass through the atmosphere without producing much effect, except upon those parts on which they directly fall.

We may now state some of the advantages which arise from the use of the magnesium light. Its color approaches very much nearer to daylight than that of the light from oils, candles, or coal-gas. As compared with the sun, its luminous intensity is $\frac{1}{525}$, but its chemical intensity is $\frac{1}{36}$, and this high actinic power makes it specially valuable for photographic purposes. Although it does not nearly equal the electric light as an illuminating agent, like it the magnesium light gives off no noxious vapors. But as it burns, white clouds of the vapor of magnesia are formed which would be more or less troublesome in private rooms. This objection is said to be to some extent removed, without diminishing the brilliancy of the light, by alloying with zinc; and at any rate, it would scarcely at all interfere with its use in large public buildings. Still less would it do so when the light is burned in the open air.

There is, however, not much hope of the magnesium light successfully competing with the electric light for the illumination of large buildings, streets, or even of ocean steamers. Recent trials with the electric light at the British museum and other places have now proved conclusively that wherever a great deal of light is required, gas is beaten out of the field on the score of economy. As respects the maintenance of an equal amount of light, gas is 20 times more costly, a difference which will speedily cover the original expense of the necessary electrical apparatus. The magnesium light, on the other hand, is much more costly than gas; and although the ores which could be used as a source of magnesium are very abundant, yet any probable cheapening of the process of extracting the metal from these is not likely to make the light a very economical one. Still, for any purpose where, for a comparatively brief time, a very intense light is required, magnesium wire or ribbon has about it almost the simplicity of a wax taper; nor are the lamps at all complex by which the metal may be burned for hours continuously.

Two kinds of magnesium lamps are made. In one of these kinds, wire or thin ribbon of the metal is coiled about a reel or bobbin. From this reel the ribbon is drawn by means of two small rollers and projected through a tube to the focus of a metallic reflector, where it passes through the flame of a spirit-lamp to insure its continuous combustion. These rollers are kept in motion either by an operator turning a small wheel, or in the more expensive forms by clock-work. In the other kind of lamp the magnesium is used in the form of dust, which is mixed with fine dry sand in the proportion of one of the former to two of the latter. This mixture is placed in a funnel-shaped reservoir, and conducted, by means of a narrow tube provided with a stop-cock, to the flame of a spirit-lamp which serves to ignite and maintain the flame of the powdered magnesium. If nitrate of strontia be substituted for sand, a splendid red light is produced, and in this way, by using other chemicals, various colors can be obtained.

It was about the year 1864 that magnesium was first made on a commercial scale, and it is found that the demand for it, although not decreasing, is scarcely at all extending. It is almost wholly used for burning in photographic lamps, for flash lights, and for fire-works. It has been attempted to make magnesium useful for other purposes. Various alloys have been made with it and other metals, such as lead, tin, zinc, cadmium, and silver; but they are all brittle and liable to change. It is very doubtful, therefore, if any of these alloys will become useful in the arts, and the metal itself is scarcely likely to be available in the construction of objects of ornament or utility, since, when exposed to damp, it soon becomes coated with a film of hydrate of magnesium.

MAGNETIC CURES. It was held by physicians of old that the magnet exercised an important influence on the human body, or on the bodies of certain persons: this being shown in the alleviation of headache, toothache, cramp, etc. It has, however, been proved that the magnet as such has no influence on animal organisms, and that accordingly all cures professedly resting on such action have been due to delusion or deceit. But it is quite otherwise with magneto-electricity and galvanism. See ELECTRICITY, MEDICAL.

MAGNETIC IRON ORE. See LOADSTONE, *ante*.

MAGNETISM (said to be derived from the city Magnesia, where the loadstone was first discovered), is the power which the magnet has to attract iron. Under DIAMAGNETISM it is stated that every substance is more or less affected by the magnet, but as

iron is *par excellence* magnetic, the term is chiefly used with reference to it. Magnets are of two kinds, *natural* and *artificial*. Natural magnets consist of the ore of iron called magnetic, familiarly known as loadstone. Artificial magnets are, for the most part, straight or bent bars of tempered steel, which have been magnetized by the action of other magnets, or of the galvanic current.

Polarity of the Magnet.—The power of the magnet to attract iron is by no means equal throughout its length. If a small iron ball be suspended by a thread, and a magnet (fig. 1) be passed along in front of it from one end to the other, it is powerfully

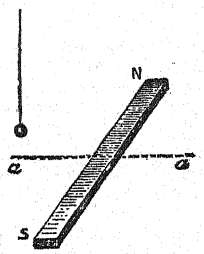

FIG. 1.

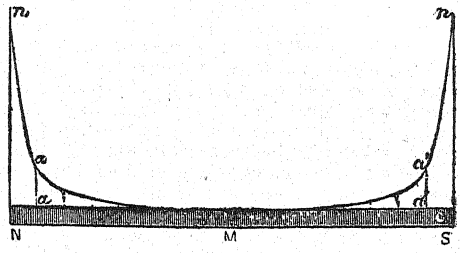

FIG. 2.

attracted at the ends, but not at all in the middle, the magnetic force increasing with the distance from the middle of the bar. The ends of the magnet where the attractive power is greatest are called its poles. By causing a magnetic needle moving horizontally to vibrate in front of the different parts of a magnet placed vertically, and counting the number of vibrations, the rate of increase of the magnetic intensity may be exactly found. Fig. 2 gives a graphic view of this increase. N S is the magnet; the lines *n* N, *a a*, etc., represent the magnetic intensities at the points N, *a*, etc., of the magnet; and the curve of magnetic intensity, N *a* M *a' n'*, is the line formed by the extremities of all the upright lines. It will be seen from the figure that the force of both halves, taking M as the dividing-point, is disposed in exactly the same way, that for some distance on either side of the middle or neutral point there is an absence of force, and that its intensity increases with great rapidity towards the ends. The centers of gravity of the areas M N *n* and M S *n'* are the poles of the magnet, which must therefore be situated near but not at the extremities.

A magnet has, then, two poles or centers of magnetic force, each having an equal power of attracting iron. This is the only property, however, which they possess in common, for when the poles of one magnet are made to act on those of another, a striking dissimilarity is brought to light. To show this, let us suspend a magnet, N S, fig. 3, by a band of paper, M, hanging from a cocoon thread (a thread without torsion). When the magnet is left to itself, it takes up a fixed position, one end keeping north, and the other south. The north pole cannot be made to stand as a south pole, and *vice versa;* for when the magnet is disturbed, both poles return to their original positions. Here, then, is a striking dissimilarity in the poles, by means of which we are enabled to distinguish them as *north pole* and *south pole*. When thus suspended, let us now try the effect of another magnet upon it, and we shall find that the pole of the suspended magnet that is attracted by one of the poles of the second magnet is repelled by the other, and *vice versa;* and where the one pole attracts, the other repels. If, now, the second magnet be hung like the first, it will be found that the pole which attracted the north pole of the first magnet is a south pole, and that the pole which repelled it is a north pole. We thus learn that *each magnet has two poles, the one a north, the other a south pole, alike in their power of attracting soft iron, but differing in their action on the poles of another magnet, like poles repelling, and unlike poles attracting, each other.*

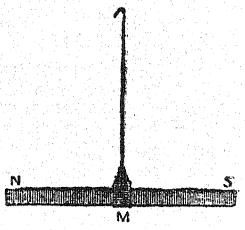

FIG. 3.

It might be thought that, by dividing a magnet at its center, the two poles could be insulated, the one half containing all the north polar magnetism, and the other the south. When this is done, however, both halves become separate magnets, with two poles in each—the original north and south poles standing in the same relation to the other two poles called into existence by the separation. *We can therefore never have one kind of magnetism without having it associated in the same magnet with the same amount of the opposite magnetism.* It is this double manifestation of force which constitutes the polarity of the magnet.

The fact of the freely suspended magnet taking up a fixed position has led to the theory that the earth itself is a huge magnet, having its north and south magnetic poles in the neighborhood of the poles of the axis of rotation, and that the magnetic needle or suspended magnet turns to them as it does to those of a neighboring magnet. All the manifestations of terrestrial magnetism give decided confirmation of this theory. It is on this view that the French call the north pole of the magnet the south pole (*pôle*

austral), and the south the north pole (*pole boréal*); for if the earth be taken as the standard, its north magnetic pole must attract the south pole of other magnets, and *vice versa*. In England and Germany the north pole of a magnet is the one which, when freely suspended, points to the north, and no reference is made to its relation to the magnetism of the earth.

Form of Magnets.—Artificial magnets are either bar magnets or horse-shoe magnets. When powerful magnets are to be made, several thin bars are placed side by side, with their poles lying in the same way. They end in a piece of iron, to which they are bound by a brass screw or frame. Three or four of these may be put up into the bundle, and these again into bundles of three and four. Such a collection of magnets is called a *magnetic magazine or battery*. A magnet of this kind is more powerful than a solid one of the same weight and size, because thin bars can be more strongly and regularly magnetized than thick ones. Fig. 4 is a horse-shoe magnet magazine. The central lamina protrudes slightly beyond the other, and it is to it that the armature is attached, the whole action of the magnet being concentrated on the projection. A good form of magnet is a parallelopiped of magnetic iron ore, with pieces of soft iron, bound to its poles by a brass frame encircling the whole. The lower ends of the soft iron bars act as the poles, and support the armature. The magnetic needle is a small magnet nicely balanced on a fine point. See COMPASS.

Magnetic Induction.—When a short bar of soft iron is suspended from one end of a magnet it becomes for the time powerfully magnetic. It assumes a north and south pole, like a regular magnet, as may be seen by using a small magnetic needle; and if its lower end be dipped into iron filings, it attracts them as a magnet would do. When it is taken away from the magnet the filings fall off, and all trace of magnetism disappears. It need not be in actual contact to show magnetic properties; when it is simply brought near, the same thing is seen, though to a less extent. If the inducing magnet be strong enough, the induced magnet, when in contact, can induce a bar like itself, placed at its extremity, to became a magnet; and this second induced magnet may transmit the magnetism to a third, and so on, the action being, however, weaker each time.

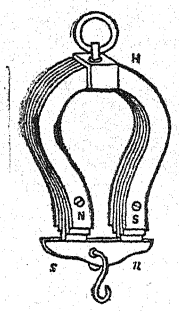

FIG. 4.

If a steel bar be used for this experiment, a singular difference is observed in its action; it is only after some time that it begins to exhibit magnetic properties, and, when exhibited, they are feebler than in the soft iron bar. When the steel bar is removed, it does not part instantly with its magnetism, as the soft iron bar, but retains it permanently. Steel, therefore, has a force which, in the first instance, resists the assumption of magnetism; and, when assumed, resists its withdrawal. This is called the *coercitive force*. The harder the temper of the steel, the more is the coercitive force developed in it. It is this force also, in the loadstone, which enables it to retain its magnetism.

Magnetization.—By single touch (Fr. *simple touche*, Ger. *einfacher strich*): The steel bar to be magnetized is laid on a table, and the pole of a powerful magnet is rubbed a few times along its length, always in the same direction. If the magnetizing pole be north, the end of the bar it first touches each time becomes also north, and the one where it is lifted south. The same thing may be done by putting, say, the north magnetizing pole first on the middle of the bar, then giving it a few passes from the middle to the end, returning always in an arch from the end to the middle. After doing the same to the other half with the south pole, the magnetization is complete. The first end rubbed becomes the south, and the other the north pole of the new magnet. *By divided touch* (Fr. *touche séparée*, Ger. *getrennter strich*): The bar to be magnetized is placed on a piece of wood with its ends abutting on the extremities of two powerful magnets. Two rubbing magnets are placed with their poles together on the middle, inclined at an angle rather less than 30° with it. They are then simultaneously moved away from each other to the ends, and brought back in an arch again to the middle. After this is repeated a few times, the bar is fully magnetized. This method communicates a very regular magnetism, and is employed for magnetic needles, or where accuracy is needed. The magnetization by *double touch* is of less practical importance, and need not here be described. It communicates a powerful but sometimes irregular magnetism, giving rise to *consecutive* poles—that is, to more poles than two in the magnet.

For horse-shoe magnets, Hoffer's method is generally followed. The inducing magnet is placed vertically on the magnet to be formed, and moved from the ends to the bend, or in the opposite way, and brought round again, in an arch, to the starting-point. A soft iron armature is placed at the poles of the induced magnet. That the operation may succeed well, it is necessary for both magnets to be of the same width. The same method may also be followed for magnetizing bars. The bars with the armatures are placed so as to form a rectangle; and the horseshoe-magnet is made to glide along both in the way just described.

Magnetization by the Earth.—The inductive action of terrestrial magnetism is a striking proof of the truth of the theory already referred to, that the earth itself is a magnet. When a steel rod is held in a position parallel to the dipping-needle (q.v.), it

becomes in the course of time permanently magnetic. This result is reached sooner when the bar is rubbed with a piece of soft iron. A bar of soft iron held in the same position is more powerfully but only temporarily affected, and when reversed, the poles are not reversed with the bar, but remain as before. If when so held it receive at its end a few sharp blows of a hammer, the magnetism is rendered permanent, and now the poles are reversed when the bar is reversed. The torsion caused by the blows of the hammer appears to communicate to the bar a coercitive force. We may understand from this how the tools in work-shops are generally magnetic. Whenever large masses of iron are stationary for any length of time they are sure to give evidence of magnetization, and it is to the inductive action of the earth's poles acting through ages that the magnetism of the loadstone is to be attributed.

Preservation and Power of Magnets.—Magnets, when freshly magnetized, are sometimes more powerful than they afterwards become. In that case they gradually fall off in strength till they reach a point at which their strength remains constant. This is called the *point of saturation.* If a magnet has not been raised to this point, it will lose nothing after magnetization. We may ascertain whether a magnet is at saturation by magnetizing it with a more powerful magnet, and seeing whether it retains more magnetism than before. The saturation point depends on the coercitive force of the magnet, and not on the power of the magnet with which it is rubbed. When a magnet is above saturation, it is soon reduced to it by repeatedly drawing away the armature from it. After reaching this point, magnets will keep the same strength for years together if not subjected to rough usage. It is favorable for the preservation of magnets that they be provided with an armature or keeper. For further information, see article ARMATURE. The power of a horse-shoe magnet is usually tested by the weight its armature can bear without breaking away from the magnet. Häcker gives the following formula for this weight: $W = a\sqrt[3]{m^2}$; W is the charge expressed in pounds; a, a constant to be ascertained for a particular quality of steel; and m is the weight in pounds of the magnet. He found, in the magnets that he constructed, a to be 12.6. According to this value, a magnet weighing 2 oz. sustains a weight of 3 lbs. 2 oz., or 25 times its own weight; whereas a magnet of 100 lbs. sustains only 271 lbs., or rather less than 3 times its own weight. Small magnets, therefore, are stronger for their size than large ones. The reason of this may be thus explained: Two magnets of the same size and power, acting separately, support twice the weight that one of them does; but if the two be joined, so as to form one magnet, they do not sustain the double, for the two magnets being in close proximity, act inductively on each other, and so lessen the conjoint power. Similarly, several magnets made up into a battery have not a force proportionate to their number. Large magnets in the same way may be considered as made up of several laminæ, interfering mutually with each other, and rendering the action of the whole very much less than the sum of the powers of each. The best method of ascertaining the strength of bar magnets is to cause a magnetic needle to oscillate at a given distance from one of their poles, the axis of the needle and the pole of the magnet being in the magnetic meridian. These oscillations observe the law of pendulum motion, so that the force tending to bring the needle to rest is proportionate to the square of the number of oscillations in a stated time.

Action of Magnets on each other.—Coulomb discovered, by the oscillation of the magnetic needle in the presence of magnets in the way just described, that *when magnets are so placed that two adjoining poles may act on each other without the interference of the opposite poles*, that is, when the magnets are large compared with the distance between their centers, *their attractive or repulsive force varies inversely as the square of the distance.* Gauss proved from this theoretically, and exhibited experimentally, that when the distance between the centers of two magnets is large compared with the size of the magnets, that is, *when the action of both poles comes into play, their action on each other varies inversely as the cube of the distance.*

Effect of Heat on Magnets.—When a magnet is heated to redness it loses permanently every trace of magnetism; iron, also, at a red heat, ceases to be attracted by the magnet. At temperatures below red heat the magnet parts with some of its power, the loss increasing with the temperature. The temperatures at which other substances affected by the magnet lose their magnetism differ from that of iron. Cobalt remains magnetic at the highest temperatures, and nickel loses this property at 662° F.

Ampere's Theory of Magnetism.—This theory forms the link between magnetism and galvanic electricity, and gives a simple explanation of the phenomena of electro-magnetism and magneto-electricity. We shall therefore preface the short discussion of these two subjects by a reference to it. Ampere considers that every particle of a magnet has closed currents circulating about it in the same direction. A section of a magnet according to this theory is shown in fig. 5. All the separate currents in the various particles may, however, be considered to be equivalent to one strong current circulating round the whole (fig. 6). We are to look upon a magnet, then, as a system, so to speak, of rings or rectangles, placed side by side, so as to form a cylinder or prism, in each of which a current in the same direction is circulating. Before magnetization the currents run in different directions, so that their effect as a system is lost, and the effect of induction is to bring them to run in the same direction. The perfection of magnetization is to render the various currents parallel to each other. Soft iron, in consequence

of its offering no resistance to such a disposition, becomes more powerfully magnetic under induction than steel, where such resistance exists. Experiment very strongly confirms the truth of this theory. Helices of copper wire, in which a current is made to circulate, manifest all the properties of a magnet. Such are shown, in skeleton, in figs. 7 and 8. Each convolution of the spiral may be taken as a substitute for one of the rings above spoken of. In helix fig. 7, the current, after entering, goes from right to left (contrary to the hands of a watch), and it is hence called left-handed; in fig. 8 it goes with the hands of a watch, and is right-handed. The extremities of both helices act on the magnetic needle like the poles of a magnet while the current passes. The poles are shown by the letters N and S, and this can be easily deduced from Ampere's rule (see GALVANISM), for, suppose the little figure of a man to be placed in any part of

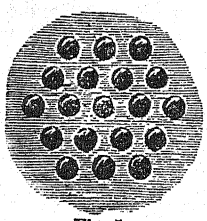

Fig. 5.

Fig. 6.

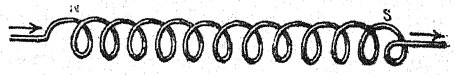

Fig. 7.

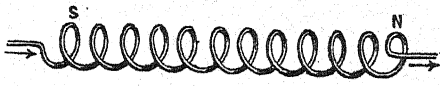

Fig. 8.

the helix fig. 7, so that, while he looks towards the axis of the helix, the current enters by his feet, and leaves by his head, the north pole will be at his left hand, as shown in the figure. In the left-handed helix (fig. 8), the poles are reversed according to the same rule. If either of these helices be hung so as to be capable of horizontal motion, which, by a simple construction, can easily be done, as soon as the current is established, the north and south poles place themselves exactly as those of the magnetic needle would do; or, if they were hung so as to be able to move vertically in the magnetic meridian, they would take up the position of the dipping-needle (q.v.).

These movements can be still further explained by reference to the mutual action of electric currents on each other. It is found that *when two currents are free to move, they endeavor to place themselves parallel to each other, and to move in the same direction,* and *that currents running in the same direction attract, and those running in opposite directions repel.* The apparatus fig. 9 is intended to prove this. The rectangle *c d e f* is movable round the pins *a* and *b*, resting on two mercury cups. The arrangement is such that while the rectangle *c d e f* is movable about its axis, a current can continue steadily to flow in it. Further description is unnecessary, the diagram explaining itself. If a wire in which a current passes downwards be placed vertically near *c d*, *c d* is attracted by it; but if the current pass upwards, it is repelled, and *e f* attracted. Place, now, the wire below and parallel to *d e*. If the current passes in the direction *d* to *e*, no change takes place, as the attraction cannot show itself; but if the current moves from *e* to *d*, the whole turns round till it stands where *e* was, and both currents run the same way. If the wire be placed at right angles to *d e*, the rectangle turns round and comes to rest, when both currents are parallel, and in the same direction.

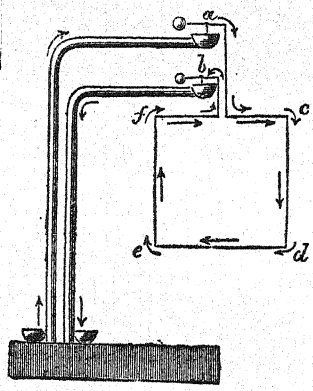

Fig. 9.

According to Ampere's theory, the earth, being a magnet, has currents circulating about it, which, according to his rule, must be from east to west, the north pole of the earth being, in our way of speaking, a south pole. A magnet, then, will not come to rest till the currents moving below it place themselves parallel to and in the direction of the earth's currents. This is shown in fig. 10, where a section of a magnet is represented in its position of rest with reference to the earth-current. The upper current being further away from the earth-current, is less affected by it, and it is the lower current that determines the position. A magnetic needle, therefore, turns towards the north to allow the currents moving below it to place themselves parallel to the earth's current. This also is shown by the rectangle in fig. 9, which comes to rest when *d* and *e* lie east and west.

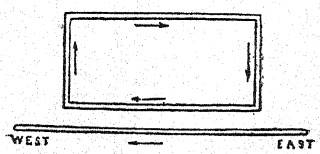

Fig. 10.

Electro-magnetism includes all phenomena in which an electric current produces magnetism. The most important result of this power of the current is the electro-magnet. This consists (fig. 11) generally of a round bar of soft iron bent into the horse-shoe form, with an insulated wire coiled round its extremities. When a current passes

through the coil, the soft iron bar becomes instantly magnetic, and attracts the armature with a sharp click. When the current is stopped, this power disappears as suddenly as it came. Electro-magnets far outrival permanent magnets in strength. Small electro-magnets have been made by Joule which support 3,500 times their own weight, a feat immeasurably superior to anything performed by steel magnets. When the current is of moderate strength, and the iron core more than a third of an inch in diameter, *the magnetism induced is in proportion to the strength of the current and of the number of turns in the coil.* When the bar is thinner than one-third of an inch, a maximum is soon reached beyond which additional turns of the wire give no additional magnetism; and even when the core is thick, these turns must not be heaped on each other, so as to place them beyond influencing the core. It follows from the above principle, that, in the horse-shoe magnet, where the inductive action in the armature must be taken into account, *the weight which the magnet sustains is in proportion to the squares of the strengths of the currents, and to the squares of the number of turns of the wire.* This maximum is in different magnets proportional to the area of section, or to the square of the diameter of the core. The electro-magnet, from the ease with which it is made to assume or lay aside its mag

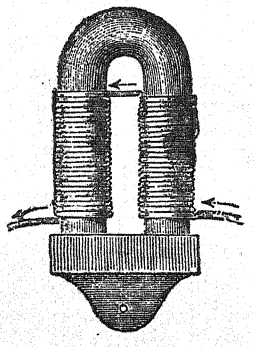

Fig. 11.

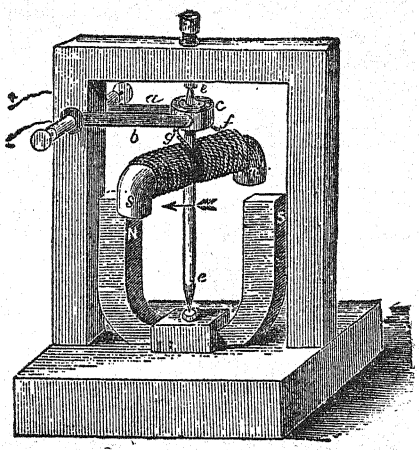

Fig. 12.

netism, or to reverse its poles, is of the utmost value in electrical and mechanical contrivances. The action of the electro-magnet is quite in keeping with Ampere's theory, as the current of the coil, acting on the various currents of the individual molecules, places them parallel to itself, in which condition the soft iron bar acts powerfully as a magnet. The direction of the current and the nature of the coil being known, the poles are easily determined by Ampere's rule.

Electro-magnetic Machines.—These take advantage of the facility with which the poles of an electro-magnet may be reversed, by which attractions and repulsions may be so arranged with another magnet as to produce a constant rotation. The forms in which they occur are exceedingly various, but the description of the apparatus in fig. 12 will suffice to illustrate their principle of working. N S is a fixed permanent magnet (it could be equally well an electro-magnet); the electro-magnet, *n s*, is fixed to the axis *e e*, and the ends of the coil are soldered to the ring *c*, encircling a projection on the axis. The ring has two slits in it dividing it into two halves, and filled with a non-conducting material, so that the halves are insulated from each other. Pressing on this broken ring, on opposite sides, are two springs, *a* and *b*, which proceed from the two binding-screws into which the wires, + and −, from the battery are fixed. In the position shown in the figure, the current is supposed to pass along *a*, to the half of the ring in connection with the end *f*, of the coil, to go through the coil, to pass by *g* to the other half of the ring, and to pass along *b*, in its return to the battery. The magnetism induced by the current in the electro-magnet, makes *s* a south, and *n* a north pole, by virtue of which N attracts *s*, and S attracts *n*. By this double attraction, *n s* is brought into a line with N S, where it would remain, did not just then the springs pass to the other halves of the ring, and reverse the current, making *s* a north, and *n* a south pole. Repulsion between the like poles instantly ensues, and *ns* is driven onwards through a quarter-revolution, and then attraction as before between unlike poles takes it through another quarter, to place it once more axially. A perpetual rotation is in this way kept up. The manner in which a constant rotary motion may be obtained by electro-magnetism being understood, it is easy to conceive how it may be adapted to the discharge of regular work. Powerful machines of this kind have been made with a view to supplant the steam-engine; but such attempts, both in respect of economy and constancy, have proved utter failures.

Magneto-electricity includes all phenomena where magnetism gives rise to electricity. Under Induction of Electric Currents (q.v.), it is stated that when a coil in which a

current circulates is quickly placed within another coil unconnected with it, a contrary induced current in the outer coil marks its entrance, and when it is withdrawn, a direct induced current attends its withdrawal. While the primary coil remains stationary in the secondary coil, though the current continues to flow steadily in the primary, no current is induced in the secondary coil. It is also shown that if, while the primary coil is stationary, the strength of its current be increased or diminished, each increase and diminution induces opposite currents in the secondary coil. Change, in fact, whether in the position or current strength of the primary coil, induces currents in the secondary coil, and the intensity of the induced current is in proportion to the amount and suddenness of the change. In singular confirmation of Ampere's theory, a permanent bar magnet may be substituted for the primary coil in these experiments, and the same results obtained with greater intensity. When a bar magnet is introduced into the secondary coil, a current is indicated, and when it is withdrawn, a current in a contrary direction is observed, and these currents take place in the directions required by Ampere's theory. A change of position of the magnet is marked by a current, as in the former case. If we had the means of increasing or lessening the magnetism of the bar, currents would be induced the same as those obtained by strengthening or weakening the current in the primary coil. It is this inductive power of iron at the moment that a change takes place in its magnetism, that forms the basis of magneto-electric machines. The manner in which this is taken advantage of will be easily understood by reference

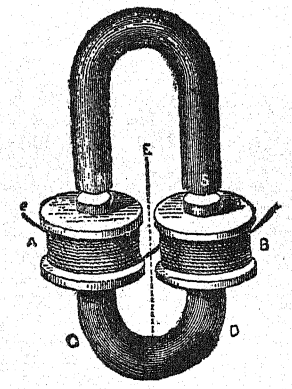

Fig. 13.

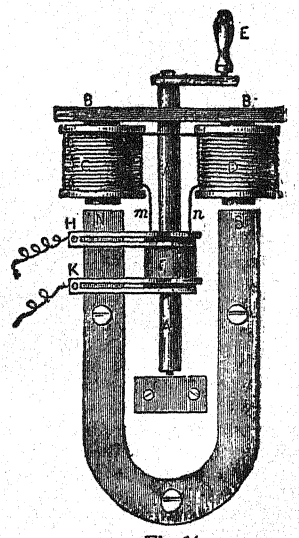

Fig. 14.

to fig. 3. N S is a permanent horse-shoe magnet, and let us suppose it to be fixed; C D is a bar of soft iron, with coils A and B wound round its extremities, and may be looked upon as the armature of the magnet. C D is capable of rotation round the axis E F. So long as C D remains in the position indicated in the figure, no currents are induced in the surrounding coils, for no change takes place in the magnetism induced in it by the action of N S. The moment that the poles of C D leave N S, the magnetism of the soft iron diminishes as its distance from N S increases; and when it stands at right angles to its former position, the magnetism has disappeared. During the first quarter-revolution, therefore, the magnetism of the soft iron diminishes, and this is attended in the coil (for both coils act, in fact, as one) by an electric current, which becomes manifest when the ends *e*, *e*, of the coil are joined by a conductor. During the second quarter-revolution, the magnetism of the armature increases till it reaches a maximum, when its poles are in a line with those of N S. A current also marks this increase, and proceeds in the same direction as before; for though the magnetism increases instead of diminishes, which of itself would reverse the induced current, the poles of the revolving armature, in consequence of their change of position with the poles of the permanent magnet, have also been reversed, and this double reversal leaves the current to move as before. For the second half-revolution the current also proceeds in one direction, but in the opposite way, corresponding to the reversed position of the armature. Thus, *in one revolution of a soft iron armature in front of the poles of a permanent magnet, two currents are induced in the coils encircling it, in opposite directions, each lasting half a revolution, starting from the line joining the poles.*

Magneto-electric Machine.—The general construction of a simple magneto-electric machine is shown in fig. 14. N S is a fixed permanent magnet. B B is a soft iron plate, to which are attached two cylinders of soft iron, round which the coils C and D are

wound. C B B D is thus the revolving armature, corresponding to C D in fig. 13. A A is a brass rod rigidly connected with the armature, and also serving as the rotating axle. F is a cylindrical projection on A A, and is pressed upon by two fork-like springs, H and K, which are also the poles of the machine. The ends, *m*, *n*, of the coils are soldered to two metal rings on F, insulated from each other. When the armature revolves, A A and F move with it. F, H, and K are so constructed as to act as a commutator, reversing the current at each semi-revolution. By this arrangement, the opposite currents proceeding from the coil at each semi-revolution are transmitted to H and K in the same direction, so that these, which constitute the poles of the battery, so to speak, remain always of the same name. When the armature is made to revolve with sufficient rapidity, a very energetic and steady current is generated. Of late years immense progress has been made in the construction of such machines. In 1866 Wilde of Manchester surprised the scientific world by a machine of unprecedented power; and more recently, Gramme of Paris has constructed another still more astonishing. These are driven by steam-engines, and completely eclipse both in power and constancy the largest galvanic battery hitherto put together. See MAGNETO-ELECTRIC MACHINE. See also ARMATURE, DECLINATION NEEDLE, DIAMAGNETISM, DIPPING NEEDLE, and ROTATION, MAGNETISM OF.

MAGNETISM, ANIMAL. See ANIMAL MAGNETISM, *ante*.

MAGNET'O-ELECTRIC MACHINE (More recent forms of). Of late years, quite a new era has arisen in the construction of magneto-electric machines. The compactness, simplicity of construction, and marvelous power which the new machines possess, give them quite a novel importance in practical electricity. The names chiefly associated with the new improvements are Wilde of Manchester, Siemens and Wheatstone, and Gramme of Paris. Mr. H. Wilde, in 1866, patented a magneto-electric machine, founded on the principle that *a current or a magnet indefinitely weak can be made to induce a current or a magnet of indefinite strength*. A general description will show how this is proved and applied.

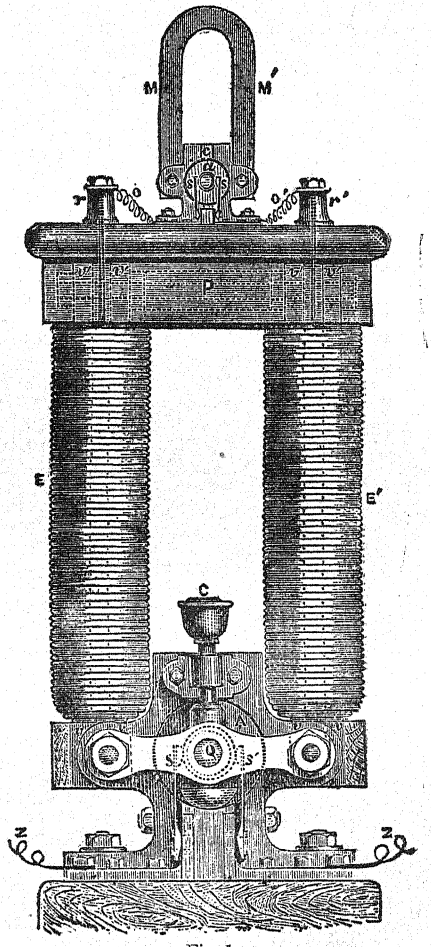

Fig. 1.

Wilde's original machine is shown in front elevation, fig. 1. It consists of two machines very similar to each other, the upper one M M', and the lower E E'. The upper and smaller machine consists of 16 permanent magnets, placed one behind the other. The front one only is seen. The poles of these are fixed at *g*, *g* (fig. 2), to what is termed the magnet cylinder. This consists of a hollow tube, made up of heavy masses of cast-iron, *c*, *c*, at each side, separated from each other by brass rods, *b*, *b*, the whole being knit firmly together, above and below, by brass bolts at *r*, *r'*. The cast-iron side pieces thus form the poles of the magnetic battery. The armature, which revolves within the tube of the magnet cylinder, is a long piece of soft iron, *a a*, and in section resembles an "H." In the hollows of the "H" the wire is turned longitudinally. This armature is shown separately in fig. 3, part of the wooden tops which cover in the wire being removed to show how the wire is turned. This form of armature was first constructed by Siemens. The ends of the armature wire are soldered to two insulated iron rings, *n*, *n'* (fig. 3), against which the springs, *s*,*s* (fig. 1), press, which convey the current from the revolving armature; *m* is the pulley of the driving-belt. If the cross-bar of the "H" stand upright (it lies horizontally in the figure), and the armature be turned round, while wires leading from the binding-screws, *r*, *r'* (fig.1), are connected with a galvanometer, it will be found that the current induced by the motion is in the same direction till the cross is again upright, but inverted. If the motion be continued beyond that point, a current in the opposite direction will ensue, lasting till the cross-bar is in its first position. The right half of

the armature gives off always one kind of electricity, and the left the other. The right and left springs, *s*, *s*, are thus always like poles, for they change from *n* to *n'* (fig. 3) when the current in the armature changes. We come now to describe the singular peculiarity and merit of Wilde's machine. The current got from the magneto-electric machine is not directly made use of, but is employed to generate an electro-magnet some hundreds of times more powerful than the magnetic battery originally employed, by means of which a corresponding increase of electricity may be obtained. This electro-magnet, E E' (fig. 1), forms the lower part of the figure, and by far the most bulky portion of the entire machine. It is of the horse-shoe form, E and E' forming the two limbs of it. The core of each of these, shown by the dotted lines, is formed by a plate of rolled iron, 36 in. in height, 26 in. in length, and 1 in. in thickness. Each is surrounded by a coil of insulated copper wire (No. 10), 1650 ft. long, wound round lengthwise in 7 layers. The current has thus, in passing from the insulated binding-screw *r* to the similar screw *r'*, to make a circuit of 3,300 feet. Each limb of the electro-magnet is thus a flat reel of covered wire wrapped round a sheet of iron, the rounded ends alone of which are seen in the figure. The upright iron plates are joined above by a bridge, P, built up also of iron-plate, and are fixed below the whole way along with the iron bars *v*, *v* to the sides of a magnet-cylinder of precisely the same construction as the one already described. The iron frame-work of the electro-magnet is shown by the dotted lines. The depth of the bridge is the same as the breadth of the bars *v'*, *v'*, which are of the same size as the bars *v*, *v*. The various surfaces of juncture in the frame-work are planed, so as to insure perfect metallic contact. The upper and lower machine are in action precisely alike, only the upper magnet is a permanent magnet, and the lower one an electro-magnet. We have the same magnet-cylinder, I, I, the same armature, A, and springs, S, S', and the same poles, Z, Z'; the size is, however, different; the caliber of the magnet-cylinder is 7 inches. The diameter of the lower armature gives the name to the machine—viz., a 7-inch machine. Figs. 2 and 3 are on the scale of the lower machine (fig. 1). The length of wire on the lower armature is 350 feet. It is 35 in. in length, and is made to rotate 1800 times a minute. The cross frame-work attached at *g g* to the magnet-cylinder, in which the front journal, *f*, of the armature rotates (at Q), is shown in the lower machine (fig. 1). When the machine is in action, both armatures are driven simultaneously by belts from the same countershaft. For the electric light, the currents conveyed to the springs, S and S', need not be sent in the same direction. In that case, the separation between *n* and *n'* is vertical; and each spring presses against only one ring during the whole revolution, receiving and transmitting each revolution two opposite currents. Oil for the journal and commutator is supplied from the cup C.

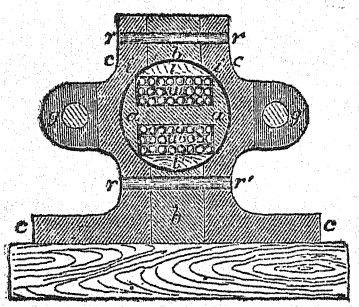

Fig. 2.

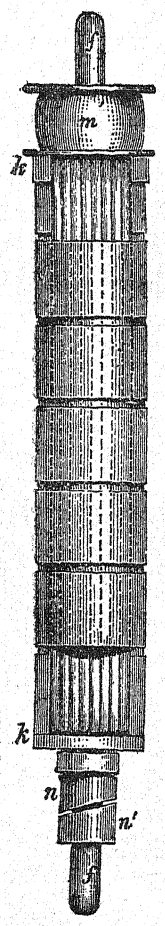

Fig. 3.

A Wilde's machine 1½ ton in weight, measuring about 5 ft. in length and height, and 20 in. wide, driven by a steam-engine produces a most brilliant electric light, and exhibits the most astonishing heating powers.

Wheatstone and Siemens gave a new interpretation to Wilde's principle. Their important discovery is of the following nature: Suppose the upper machine in fig. 1 removed, and that we have nothing but the electro-magnet and armature left. If the wires proceeding from the binding-screws of the armature be joined up with the electro-magnet, we might fancy that, there being no permanent magnetism, no result would follow on the armature being moved. Such, however, is not the case. If the armature be moved at any velocity, it will soon be brought to a halt by the mutual action ensuing. In the electro-magnet there is always some magnetism left. This induces a feeble current in the coil, but this is sufficient to make the magnet stronger and able to induce a stronger current, and this reciprocal action continues until it grows to an enormous intensity. So great, indeed, would it become, that if we had sufficient mechanical energy at our disposal to persist in the motion, the coils of armature and electro-magnet would be melted, and the machine destroyed. This startling discovery may, however, be thought of little value, as a machine that consumes its own electricity is of no external use. All machines now

work on this reciprocal principle, and a description of them will best show how it is turned to account. Ladd was the first to construct a machine on Wheatstone and Siemens's principle. In the armature there are two unequal coils, the larger for furnishing the external current, the smaller for exciting the electro-magnet. These two coils revolve together, the one at right angles to the other, in the same magnet-cylinder. In large machines he uses two magnet-cylinders, one at each end of the electro-magnet; or rather, he uses two electro-magnets, and the two armatures complete the magnetic circuit. Ferguson of Edinburgh alters Ladd's arrangement in using only one piece of iron for the armature of the machine with two grooves cut in it, a larger one for the coil giving the external current, and a smaller one for the exciting current. This offers the advantage that the heating of the solid iron of the armature by repeated magnetism is lessened by being transformed into an electric current. The electro-magnet is thus fed by a current obtained not by an additional expenditure of energy, but by the utilization of force that would be otherwise converted into useless or even hurtful heat.

The great drawback of all the forms of the machine just described is the enormous velocity at which they rotate—some 2,000 or more revolutions in the minute. At this speed a machine soon wears itself out. Another disadvantage is the heating of the armatures in Wilde and Ladd's machine. Ferguson's has never been tried on a large scale. It is found necessary to keep the armatures cool by a flow of cold water. This heat, however removed, is manifestly a mere squandering of the energy of motion, and a loss to the current given off. A third objection is the loss that always takes place when the side-springs change from the one ring to the other, sparks more or less bright accompanying the change. For the electric light, however, the alternate currents are used, and this source of loss is not experienced. These defects are removed in the latest form of the electro-magnetic machine by Gramme of Paris. In it, instead of a solid armature of iron, a ring is employed on which a great number of bobbins of wire are set. Fig. 4 is intended to explain the rudimentary principle of it. The ends of the wires of two contiguous bobbins are soldered to strips of metal called sectors. These are shown as radii in the figure. In the machine itself they are first brought down radially, then turned at right angles so as to be parallel to the axis of the machine. They are very numerous (though few in the figure), and being separated from each other by sheets of silk, form a compact whole. Metallic brushes, B, B, rub on the end face of the sectors, and form the poles of the revolving armature. The principle of action may be thus understood: Suppose we first ascertain what takes place in the coil of one bobbin as it revolves in the presence of the magnetic poles, P, N. If we start from the equatorial line, E E', and go by successive impulses, we find that, when the bobbin is joined with a galvanometer, the current induced is always in one direction until we come again to the equatorial line; but when we pass this, the current is reversed on the other side. This is much the same as what is found in the Siemens armature. But there is this difference here: The armature wire with the sectors is continuous from end to end. On each side of the equatorial line we have two equal and opposite electric forces or batteries, and these, if left alone, would neutralize each other. But if, in the equatorial line, we introduce brushes to act as poles, we have, as it were, two galvanic batteries joined up, as it is called, in quantity, with both positive poles together and also both negative. The brushes embrace several sectors at once, so there is no spark when they leave any particular sector, contact being established with the others. The conditions of the machine never alter, and hence the current is perfectly steady, and the sectors being always of the same sign at the points where the brushes rub, the current is always in the same direction. Siemens and Wheatstone's principle is employed in Gramme machines. There are two fixed electro-magnets, and two armatures on the same spindle; one electro-magnet and one armature being set apart for exciting both electro-magnets, and the other armature and electro-magnet for sending out the external current. Astonishing as were the effects produced by Wilde's machine, those obtained from Gramme's seem quite to eclipse them. In comparing two magneto electric machines, we must take into account the kind of wire used for the revolving armature. For tension purposes, a thin and long wire gives the best results; for quantity or heating purposes, a short and thick wire does best. To compare a tension with a quantity armature, the same test even in the same machine would give most contradictory results. But comparing, so far as possible, machines intended for the same purpose, Gramme seems to have the advantage of all others. In the first place, the

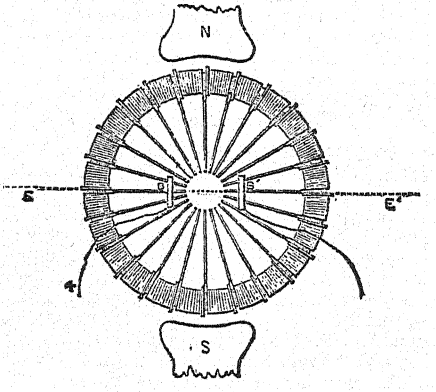

Fig. 4.

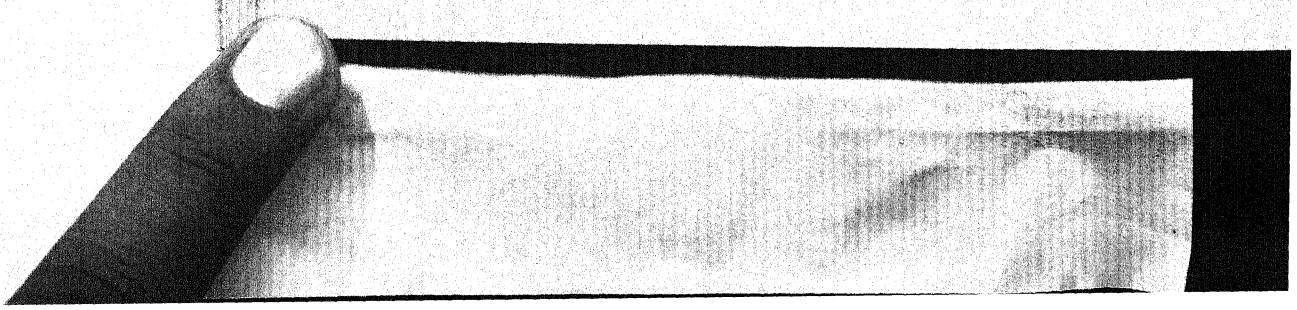


speed of revolution seldom exceeds 800 revolutions per minute; 300 is sufficient for most purposes. A Gramme machine driven by the hand will melt 10 in. of an iron wire $\frac{1}{25}$ of an inch in diameter, a feat not accomplished by any other arrangement. The electric light got by a 3-horse-power engine working a machine a ton in weight is equal to upwards of 8,000 sperm candles. A signal-light of this kind has been constructed for the house of lords, under the superintendence of the eminent engineer Conrad W. Cooke, who has rendered no small service in perfecting the machine. The carbons consumed last for four hours, and when burned out are instantaneously replaced. A Gramme machine adapted for electro-plating, and worked by a 1-horse-power engine, deposits nearly 27 oz. of silver per hour, an achievement far transcending the similar performance of other machines. Among the heating wonders of the Gramme machine we are told of a file half an inch in diameter being burnt up in 5 minutes, of 15 ft. of No. 18 platinum wire being brought to a glowing heat, and of 8 ft. of iron wire .051 inch in diameter being fused.

MAGNIFICAT, a musical composition in the evening service of the Roman Catholic church, and also of the Lutheran and English churches. The words are taken from Luke i. 46–55, containing the "song of the Virgin Mary," which, in the Vulgate, begins with *Magnificat*. In the Roman Catholic church, the Magnificat is a grand hymn, powerful in melody and harmony, mixed with pompous fugues, and with full instrumentation. In modern time there have been few attempts in the Roman Catholic service to supersede the older music of the Magnificat (by Palestrina); but in the service of the church of England, where the music is of a less elevated character, new compositions are frequently written for the Magnificat, by composers strictly of the English school.

MAGNIFYING-GLASS. See MICROSCOPE, *ante*.

MAGNIN, CHARLES, 1793–1862; b. Paris; received a superior education, and at the age of 20 became an assistant in the imperial library, and in 1832 a director. He wrote for the Paris press, theatrical criticism, essays, and sketches, and attracted the favorable notice of leading French writers. He also delivered lectures at the Sorbonne on the origin of the modern stage, and gained a sufficient reputation as a man of learning to obtain a seat in the academy of inscriptions and belles-lettres. His published works include *Causeries et Méditations Historiques et Littéraires; Les Origines du Théâtre Moderne; Le Théâtre des Hrosvitha;* and *Histoire des Marionettes*.

MAGNOLIA, a genus of beautiful trees of the natural order *magnoliaceæ*, having a calyx of 3 sepals, a corolla of 6 to 12 petals, and carpels in spikes arranged in cones, and opening at the dorsal suture. They are natives chiefly of North America, the Himalaya mountains, China, and Japan. The flowers are large and solitary; the leaves large. The wood is in general soft, spongy, and of little value. *M. grandiflora*, sometimes called the BIG LAUREL, has white flowers sometimes a foot in diameter. It is a lofty and magnificent evergreen tree, conspicuous at a great distance, found in the lower districts from North Carolina to the gulf of Mexico. It succeeds well as an ornamental tree in the s. of England, but in Scotland requires a wall and some protection in winter. *M. tripetala* is found on the Alleghany mountains, and extends as far n. as lat. 43°. From the radiated manner in which its leaves are disposed at the extremities of the branches, it has received the name of UMBRELLA TREE. It has very large white flowers. It is one of the species most commonly cultivated in Britain, but in Scotland it requires a wall. *M. acuminata* inhabits the same districts, and is a lofty tree with greenish-yellow flowers. It endures the climate of Britain well, but its flowers are not so much admired as those of some of its congeners. *M. glauca*, a native of Pennsylvania, Virginia, and Carolina, is known by the names of WHITE BAY, BEAVERWOOD, and SWAMP SASSAFRAS. It is a tree or shrub of 15 to 20 ft. in height, with very beautiful and fragrant white flowers. The YULAN, or Chinese magnolia (*M. yulan* or *conspicua*), has been much cultivated in China for more than 1200 years, on account of its beautiful and fragrant white flowers, which it produces in great profusion. It is one of the finest ornamental trees we possess, and succeeds well in the s. of England, and against a wall in Scotland. It is a deciduous tree, and the flowers expand before the development of the leaves. *M. excelsa*, one of the finest species known, is a predominant tree in some parts of the Himalaya mountains, at an elevation of 7,000 or 8,000 ft., the mountains when it is in blossom appearing as sprinkled with snow. *M. Campbellii*, another native of the same region, produces great rose-colored flowers, and is described by Dr. Hooker as the most superb of the genus. Allied to the genus *magnolia* is *Michelia*, some of the species of which are amongst the most valuable timber trees of Nepaul, and very ornamental. The bark of some of them is used medicinally, and the fragrant flowers of a species called champac are the delight of the people of Hindustan. *Manglietia* is another closely allied genus, to which belong valuable timber trees of Nepaul and of the Indian islands. The natural order *magnoliaceæ* is closely allied to *ranunculaceæ*, differing chiefly in the arborescent habit, and in the large stipules which envelop the young leaves before they open, but soon fall off. The leaves are simple. Aromatic properties are prevalent. To this order belong the *tulip tree*, *star anise*, and *winter's bark*.

MAGNUS, HEINRICH GUSTAV, 1802–70; b. Berlin; educated at the university of Berlin, where he devoted himself to the study of natural science. He also studied chemistry with Berzelius at Stockholm. At the age of 26 he had already made important discoveries in chemistry, and in 1834 was made extraordinary, and in 1845, ordinary professor of physics and technology in the Berlin university. He made important experiments on the transmission of heat through gases, which were published in 1860.

MAGNUSSEN, FINN, a distinguished scholar and archæologist, was b. in 1781 at Skabholt, in Iceland, where his family, both on his mother's and father's side, had for many generations been distinguished for learning and integrity. In 1797 Magnussen entered the university of Copenhagen with a view of studying for the law; and although he so far fullfilled the original intention of his education as to practice this profession for some years in Iceland, his strong bent towards archæological pursuits led him, in 1812, to return to Copenhagen, where he devoted himself with much zeal to his favorite studies, under the direction of his distinguished countrymen, Thorkelin and Thorlacius. In 1815 he obtained a chair of literature in the university; and in 1819, at the solicitation of the academy of fine arts, he gave a course of lectures on ancient northern literature and mythology. From this, or even an earlier period, to the close of his life, Magnussen devoted himself to the elucidation of these subjects with a success that was generally commensurate with the great ability and acute learning which he brought to bear upon it, although in some few instances his zeal led him to adopt too hasty conclusions. Among his earliest and most noteworthy works are his papers on the aboriginal home and earliest migrations of the Caucasian races (1818); his contributions to northern archæology (1820); the indices, glossaries, and lexicon which he compiled for the elucidation of the 2d and 3d of the Arne-Magnussen editions of the Eddas (1818 and 1828); his comprehensive translation of the Elder Edda (*Aldre Edda, oversat og forklaret*, Kopen. 1824); and his exposition of the same work (*Edda læren og dens Opfindelse*, Kop. 1824). Among his later works, his *Runamo og Runerne* (Kop. 1841) has given rise to much angry discussion; and although many of his interpretations of assumed runes have been proved to be utterly untenable, the learning and acumen which he brought to bear on the subject of runes generally, have thrown great light on this branch of archæology, both in regard to North American and ancient northern remains. In conjunction with Rafn, Magnussen elucidated the history and antiquities of Greenland in an able work (*Grönland's Historiske Mindesmerker*, Kop. 1838–42); and he subsequently prosecuted a similar course of inquiry in regard to Russia in *Antiquités Russes* (Cop. 1850–52). In addition to these works, Magnussen annotated nearly all the most important remains of old northern literature, as the *Heimskringla*, *Hakonarmal*, *Laxdæla-Saga*, etc.; and besides numerous monographs on arcnæological and historic subjects of interest, made many valuable contributions te current Icelandic literature. During his latter years, Magnussen sat in the Danish landthing as deputy for Iceland and the Faroe isles, in which capacity he gave evidence of considerable political knowledge and patriotic zeal. At his death, in 1847, he held the office of *Geheimarchivar* in the royal chamber of archives.

MAGO, a common Carthaginian name; no less than 14 different persons bearing it occur in history; of whom the most distinguished is Mago, the son of Hamilcar Barca, and a younger brother of Hannibal (q.v.) and Hasdrubal.

MAGOFFIN, an e. co. of Kentucky, drained by the Licking river, and bounded on the e. by mountain ranges. The surface varies in character, being fertile in parts; 600 sq.m.; pop. '80, 6,943. The productions are not abundant; wheat, Indian corn, wool, potatoes, oats, and butter, are the most important. Co. seat, Salyersville.

MAGOON', ELISHA L., D.D., b. N. H 1810; at first a bricklayer, but in 1840 ordained to the ministry of a Baptist church, and settled at Richmond, Va. After a tour in Europe, and pastorates at New York and Albany, he removed in 1860 to Philadelphia, where he remains. He has published *Orators of the American Revolution*, 1848; *Living Orators of America*, 1849; *Republican Christianity*, 1849; and *Westward Empire*, 1856. He has shown broad literary taste and culture.

MAGPIE, or PIE (*Pica*), a genus of birds of the family *Corvidæ* (q.v.), differing from the true crows chiefly in the long and graduated tail. They are also of smaller size and brighter colors, the most prevalent color being blue with bars of black and white. The only British species is the COMMON MAGPIE (*P. caudata*), the *Kitta* of the Greeks, and *Pica* of the Romans; a common bird in Britain, and almost all parts of Europe, and too well known to require particular description; its bright but not finely mingled colors—black, white, and blue—making it always conspicuous, and its dissonant, harsh cry equally attracting attention. The magpie is generally to be seen in pairs throughout the year. It builds its nest in high trees; the outside being formed of thorny sticks strongly interwoven, the inside plastered with earth and lined with fibers and dry grass; the top a dome, and one aperture left on the side for the parent bird. The magpie is shy and vigilant in an extreme degree, notable for cunning, both in eluding enemies, and in seeking its own food, as to which it may be said that nothing comes amiss to it, grain being not unacceptable, but eggs or carrion preferable. In Britain, it is persecuted by gamekeepers; in Norway, it is encouraged in the neighborhood of human habitations, and

consequently often makes its nest under the eaves of churches and other buildings. The magpie is easily tamed, becomes impudently familiar, and learns to articulate a few words. Both in a wild and tame state, it has a propensity to seize and carry off bright or glittering articles. It abounds in most parts of Europe and the north of Asia, and in the northern parts of America, but is rare in the parts of America near the Atlantic.—The other species are mostly natives of the eastern parts of Asia.

MAGRUDER, JOHN BANKHEAD, 1810–71; b. Va.; graduated at the military academy in 1830, and was appointed second lieut. in the infantry. He was promoted first lieut. in 1836, and capt. in 1846. He served with distinction through the Mexican war, at the head of the light battery attached to the division of gen. Pillow. He was brevetted maj. after Cerro Gordo, and lieut.col. after Chapultepec, where he was wounded. He resigned from the army April 2, 1861, to enter the confederate service, in which he was made successively col., brig.gen., and maj.gen. He was at first attached to the army of Virginia, commanding at Yorktown till its evacuation in May, 1862, when he joined the campaign on the Chickahominy. In October of the same year he went to Texas to take command of the department of the west, embracing, besides Texas, Arizona and New Mexico. He remained in active service in Texas throughout the war, conducting a number of military operations, of which the most brilliant resulted in the abandonment of Galveston by the federal forces. After the war he lived for a time in Mexico, but afterwards settled in Texas.

MAGUIRE, JOHN FRANCIS, 1815–72, b. Ireland; a lawyer and journalist. He sat in parliament as member for Dungarvon from 1852 to 1865, and for Cork from 1865 till his death. He was mayor of Cork for several years, and owned and edited there the *Cork Examiner*. He was the author of *The Industrial Movement in Ireland in* 1852; *Rome and its Ruler; The Irish in America; Life of Father Mathew*, and *The Next Generation*.

MAG'YAR. See HUNGARY.

MAHABHÂRATA (from the Sanskrit *mahat*—changed to *mahâ*—great, and *Bhârata*) is the name of one of the two great epic poems of ancient India. For the other, see the article RÂMÂYAN'A. As its main story relates to the contest between two rival families, both descendants of a king, Bharata, the word Mahâbhârata probably implies "the great history of the descendants of Bharata;" for another explanation of the word, which connects it with *bhâra*, weight, was obviously invented merely to convey an idea of the enormous extent of this poem. According to this explanation, it would mean the "very weighty (poem)," because, "when weighed, it was found to be heavier than all the four Vedas together with their mystical writings." However devoid of grammatical value this popular account of the word Mahâbhârata may be, it does not exaggerate the bulk of this epos, which, in its present condition, consists of upwards of 100,000 verses, each containing 32 syllables; while, if a tradition, reported in the introduction to the work itself, could be trusted, it was formerly known in other recensions of a still greater extent. In its actual shape, it is divided into 18 parvans or books, the *Harivansa* (q.v.) being considered as a supplementary part of it. That this huge composition was not the work of one single individual, but a production of successive ages, clearly results from the multifariousness of its contents, from the difference of style which characterizes its various parts, and even from the contradictions which disturb its harmony. Hindu tradition ascribes it to *Vyâsa;* but as Vyâsa means "the distributer or arranger;" and as the same individual is also the reputed compiler of the Vedas, Purânas, and several other works, it is obvious that no historical value can be assigned to this generic name. The contents of the Mahâbhârata may be distinguished into the leading story and the episodical matter connected with it. The former is probably founded on real events in the oldest history of India, though in the epic narrative it will be difficult to disentangle the reality from the fiction. The story comprises the contest of the celebrated families called the Kauravas and Pândavas, ending in the victory of the latter, and in the establishment of their rule over the northern part of India. Kuru, a descendant of Bharata, had two sons, Dhritarâshtra and Pându. The sons of the former, commonly called the *Kauravas*, were a hundred in number, the eldest of them being Duryodhana; those of Pându—the *Pândavas*—were five, Yudhishthira, Bhîma, Arjuna, and the twins Nakula and Sahadeva. Pându having resigned his throne, Dhritarâshtra, though blind, assumed the government, and ultimately divided his kingdom between his sons and the sons of Pându. The former, however, coveting the territory allotted to the Pându princes, endeavored to get possession of it. A game of dice was the means by which they bound over their cousins to relinquish their kingdom, promising, however, to restore it to them if they passed twelve years in the forests, and a thirteenth year in such disguises as to escape detection. This promise was faithfully kept by the Pândavas; but the term of their banishment having expired, the Kuru princes refused to redeem their word. A war ensued, ending in the complete destruction of the Kauravas. These are the meager outlines of the leading story of the Mahâbhârata, where, as may be inferred, Duryodhana and his brothers are pictured as the type of all conceivable wickedness, and the Pându princes as paragons of virtue and heroism. That the latter are the incarnations of sundry deities—that the gods take an active part in the development of the plot, in short, that Hindu mythology is always interwoven with these stirring

events of semi-historical Hindu antiquities, requires no further remark to any one but slightly acquainted with Hindu poetry. It is necessary, however, to observe that out of the 100,000 verses which constitute the great epos, barely a fourth part is taken up by this narrative; all the rest is episodical. The matter thus, as it were, incidentally linked with the main story, may be distributed under three principal heads, passing over such minor additions as fables, genealogical lists, geographical enumerations, and the like. One category of such episodes comprises narratives relating to the ancient or mythical hystory of India, as, for instance, the episodes of Nala and Sakuntalâ; a second is more strictly mythological, comprising cosmogony and theogony; a third is didactic or dogmatic—it refers to law, religion, morals, and philosophy, as in the case of the celebrated Bhagavadgîtâ, and the principal portions of the 12th and 13th books. By means of this episodical matter, which at various periods, and often without regard to consistency, was superadded to the original structure of the work, the Mahâbhârata gradually became a collection of all that was needed to be known by an educated Hindu; in fact, it became the encyclopædia of India. "There is no narrative on earth," the Mahâbhârata says of itself, "that is not founded on this epos. . . . . The twice-born, though knowing the four Vedas and their supplementary sciences, has no wisdom unless he knows this great epos. . . . . It is the great manual of all that is moral, useful, and agreeable." Yet it should be noticed that the Brahmanic authors of the great epos intended it especially as an encyclopædia for the Kshattriya or military caste; for it is chiefly the history, the interests, the religion, and the duties of the second caste which are taught in it, always, of course, with a view of establishing the superiority of the Brahmanic caste. Sectarian religion is for this reason not emphasized in the Mahâbhârata, though the later sectarian works (see PURÂNA) have largely drawn, for their purposes, on the mythological material afforded them by the great epic work. The text of the Mahâbhârata has been published in Calcutta in four quarto volumes (1834–39), to which is added a fifth volume, containing a table of contents. Two other editions are in the course of publication at Bombay. The best researches on the Mahâbhârata are those of Lassen, in his *Zeitschrift für die Kunde des Morgenlandes* (1837, ff.), and in his *Indische Alterthumskunde*. A sort of analysis of the leading story of the Mahâbhârata (not of the episodes) is given in Eichhoff's *Poésie Héroïque des Indiens* (Paris, 1860), and by Prof. Monier Williams (*Indian Epic Poetry*, London, 1863). See also Talboys Wheeler's *History of India* (1867).

MAHÂDEVA ("the great god") is one of the usual names by which the Hindu god Si'va is called. (His consort, Durgâ, is similarly styled *Mahâdevî*, ("the great goddess.") In Buddhistic history. Mahâdeva, who lived 200 years after the death of the Buddha S'âkyamuni, or 343, is a renowned teacher who caused a schism in the Buddhistic church. His adversaries accuse him of every possible crime, but as he is ranked among the Arhats, his eminence cannot be matter of doubt. The school founded by him is called *Púrvasaila*. See W. Wassiljew, *Der Buddhismus*, etc. (St. Petersburg, 1860).

MAHÂKÂS'YAPA, one of the most renowned disciples of the Buddha S'âkyamuni. He arranged metaphysically the portion of the sacred writings of the Buddhists called Abhidharma; and tradition ascribes to him also the origin of the *Sthavira* division of the *Vaibhâshika* school of Buddhistic philosophy. Many legends are connected with his life.—See E. Burnouf, *Introduction à l'Histoire du Buddhisme Indien* (Paris, 1844), and his posthumous work, *Le Lotus de la Bonne Loi* (Paris, 1852).

MAHAN', ASA, D.D., b. in Vernon, N.Y., in 1799; graduated at Hamilton college in 1824, and at Andover theological seminary in 1827; in 1829 became pastor of a Presbyterian church in Pittsford, N.Y., and of a church of the same denomination in Cincinnati in 1831; became president and professor of philosophy at Oberlin in 1835; was president of Cleveland university from 1850–56; pastor of a Congregational church in Jackson, Mich., from 1856–58, and of another at Adrian from 1858–61; and president of Adrian college from 1861–71. His principal works are, *The Scripture Doctrine of Christian Perfection;* the *Science of Intellectual Philosophy;* the *Doctrine of the Will;* the *Science of Moral Philosophy;* the *Science of Logic;* and *Modern Mysteries Explained and Refuted*—the latter directed against spiritualism. He has written also a work of some size in the department of military criticism.

MAHAN, DENNIS HART, LL.D., 1802–71; b N.Y.; educated at West Point, and appointed to the army in the engineer corps. In 1825 he was made assistant professor of mathematics at the academy; and in 1832, after four years of study abroad, professor of military engineering, and remained at West Point in that capacity till his death, which occurred by suicide in a fit of temporary insanity. He stood high in his profession, and he wrote a number of text books on civil and military engineering, which came into general use in schools and colleges in the United States. His *Treatise on Field Fortifications* appeared in 1836, and was supplemented in 1865, by *Military Mining and Siege Operations*, the two constituting parts I. and II. respectively, of *An Elementary Course of Military Engineering*. He also published *An Elementary Course of Civil Engineering* in 1837, which he rewrote and revised in 1868; *Advanced Guard, Outpost, and Detachment Service of Troops*, 1847; *Elementary Treatise on Industrial Drawing*, 1853; *Descriptive Geometry*, 1864; and an edition of Moseley's *Mechanical Principles of Engineering and*

Architecture, 1856. Brown university, Dartmouth college, and William and Mary college conferred upon him the degree of LL.D.

MAHAN, MILO, D.D., 1819–70; b. Suffolk, Nansemond co., Va.; was educated at St. Paul's college, Flushing, L.I.; took orders in the Protestant Episcopal church in 1845; became rector of Grace church, Jersey City, in 1848; and in 1850 assistant minister of St. Mark's church, Philadelphia; was elected professor of church history in the Episcopal general theological seminary in New York in 1851, which position he held for 13 years. In 1864 he became rector of St. Paul's church, Baltimore. His published works are *The Exercise of Faith; History of the Church the First Three Centuries; Reply to Colenso; Palmoni, a Free Inquiry; Comedy of Canonization.* The Rev. J. Hopkins collected and published his works, with a memoir, in 3 vols.

MAHANNUD'DY (more accurately, MAHANADI), a river of India, rises on the s.w. border of the presidency of Bengal, in lat. 20° 20′ n., long. 82° east. After an eastward course of 520 m., 300 m. of which are navigable, having divided into several branches at the town of Cuttack, which forms the head of its delta, it flows e. and s.e. through the district of that name, and falls by several mouths into the bay of Bengal.

MAHANOY' CITY, a t. in Schuylkill co., Penn.; 80 m. from Philadelphia; pop. 5,553; situated in the valley of the same name and in the neighborhood of extensive coal fields, in the mining of which and trades connected with it the people of the city are mainly occupied.

MAHÂSÂNGHIKA is the name of one of the two great divisions of the Buddhistic church which arose 200 years after the death of the Buddha S'âkyamuni, or about 343, caused, as it seems, by the schism of Mahâdeva (q.v.). For the other division, see STHAVIRA. Out of the Mahâsânghika school arose, in the course of the next centuries, numerous sects. For the tenets common to all, and for those peculiar to each of these sects, the special student of the Buddhist religion will at present most advantageously consult the work of prof. W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St. Petersburg, 1860).

MAHAS'KA, a co. in s.e. Iowa, watered by the Des Moines and forks of the Skunk rivers, and traversed by the Central and Des Moines Valley railroads; 576 sq.m.; pop. '80, 25,201. The surface is chiefly prairie land, with wooded intervals. The soil is fertile, producing largely of wheat, Indian corn, oats, hay, and potatoes. Considerable wool is grown; the number of cattle, sheep, and swine is large, and there are some quite important manufactories. Co. seat, Oskaloosa.

MÂHAVANSA is the title of two celebrated works written in Pâli, and relating to the history of Lankâ, or Ceylon (q.v.), from its earliest period down to the reign of Mahâsena, who died 302 after Christ. The older work was probably composed by the monks of the convent Uttaravihâra at Anurâdhâpura, the capital of Ceylon. Its date is uncertain; but it has apparently preceded the reign of Dhâtusena (459–477), as that monarch ordered it to be read in public, a circumstance which seems to prove the celebrity it enjoyed already at his time.—The later work of the same name is an improved edition and continuation of the former. Its author, *Mahânâma*, was the son of an aunt of the king Dhâtusena, and he brings down the history of Ceylon, like his predecessor, to the death of Mahâsena. A first volume of the text of the latter work, "in Roman characters, with a translation subjoined, and an introductory essay on Pâli Buddhistic literature," was published by the Hon. George Turnour (Ceylon, 1837). See also Lassen, *Indische Alterthumskunde*, vol, ii. p. 15, ff. (Bonn, 1852).

MAHAVIRA (literally, "the great hero"), also called *Vîra* and *Vardhamâna*, is the 24th or last Jina, or deified saint, of the Jainas (q.v.), described as of a golden complexion, and having a lion for his symbol. His legendary history is given in the *Kalpa-Sûtra* (q.v.) and the *Mahavîra-Charitra*, two works held in great authority by the Jainas. According to these works, Mahâvîra's first birth occurred at a period infinitely remote; it was as nayasâra, head man of a village, that he first appeared in the country of Vijaya, subject to S'atrumardana. He was next born as *Marîchi*, the grandson of the first Jaina saint *Rishabha*; he then came to the world of Brahmâ, was reborn as a worldly-minded Brâhman'a, and after several other births—each being separated from the other by an interval passed in one of the Jaina heavens, and each period of life extending to many hundreds of thousands of years—he quitted the state of a deity to obtain immortality as a saint, and was incarnate towards the close of the fourth age (now past), when 75 years and 8½ months of it remained. After he was 30 years of age he renounced worldly pursuits, and departed, amidst the applauses of gods and men, to practice austerities. Finally, he became an Arhat or Jina; and at the age of 72 years, the period of his liberation having arrived, "he resigned his breath," and his body was burned by Indra and other deities, who divided amongst them such parts as were not destroyed by the flames, as the teeth and bones, which they preserved as relics; the ashes of the pile were distributed amongst the assistants: the gods erected a splendid monument on the spot, and then returned to their respective heavens. At what period these events occurred is not stated, but judging from some of the circumstances narrated, the last Jina expired about 500 years before the Christian era. Other authorities make the date of this event about a century

and a half earlier. The works above referred to state, with considerable detail, the conversions worked by Mahâvîra. Among the pupils were *Indrabhûti* (also called Gautama, and for this reason, but erroneously, considered as the same with the founder of the Buddhist religion), *Agnibhûti*, *Vâyubhûti*—all three sons of Vasubhûti, a Brâhman of the Gotama tribe, and others. These converts to Jaina principles are mostly made in the same manner: each comes to the saint prepared to overwhelm him with shame, when he salutes them mildly, and, as the Jainas hold, solves their metaphysical or religious doubts. Thus Indrabhûti doubts whether there be a living principle or not; Vâyubhûti doubts if life be not body; Man'd'ita has not made up his mind on the subjects of bondage and liberation; Achalabhrâtr'i is skeptical as to the distinction between vice and virtue; and so on. Mahâvîra removes all their difficulties, and by teaching them the Jaina truth, converts them to the doctrine of his sect. For a summary account of the life of this saint, see H. T. Colebrooke's *Miscellaneous Essays*, vol. ii. p. 213, ff.; H. H. Wilson's works, vol. i. p. 291, ff.

MAHIM', a t. of the island of Bombay, and 7 m. n. of the city of Bombay, to which it is joined by railway. It is situated on the s. side of the channel separating the island from Salsette, and at the point where they are connected by a road running partly on arches of masonry, partly on a causeway. The passage is commanded by a fort. The town is ill-built, and inhabited chiefly by Christians of Portuguese descent, who have here a church and some other relics of their former prosperity. The inhabitants are chiefly employed in fishing, the place being famous for its oysters. Pop. 9,000.

MAHMOOD (or MAHMÛD) OF GHIZNI (ABUL-KASIM-YEMINED-DAULAH), Sultan of Persia. See GHIZNEVIDES, *ante*.

MAHMUD II., Sultan of Turkey, and younger son of sultan Abdul-Hamid, was b. July 20, 1785, and on the deposition of his brother, Mustafa IV., by Baïraktar, pasha of Ruschuk, was raised to the throne, July 28, 1808. Baïraktar became his grand vizier, and vigorously aided him in his attempts to reform the constitution of the Turkish army. But the Janizaries, emboldened by their successful opposition to the same attempt on the part of Selim III., rose in rebellion, and the murder of the vizier put a stop for the present to the carrying out of any military reforms. Mahmud was also attacked by the rebels, but he secured his life and throne by the destruction of all the other members of the royal house of Osman. The war with Russia now commenced vigorously; but after a conflict of three years' duration, which completely prostrated the strength of Turkey, peace was concluded at Bucharest (q.v.). The daring and energetic Mahmud now applied himself to the subjugation of the semi-independent pashas of the outlying provinces, and to the promotion of radical reforms in all departments of the government. The rebellion of the Wahabis was crushed through the instrumentality of Ibrahim Pasha in 1818, and Ali Pasha (q.v.), "the lion of Janina," was overthrown in 1822. Greece revolted in 1821, and its independence was secured by the battle of Navarino in 1827, but it was not recognized as a separate kingdom by Turkey till April, 1830. During the progress of the Greek revolution, Mahmud had been steadily though secretly maturing his plans of military reform, and in June, 1826, the success of his schemes was crowned by the destruction of the Janizaries (q.v.). The consequent confusion into which Turkey was thrown was immediately taken advantage of by Russia for obtaining fresh concessions. Mahmud, however, despite these interruptions, proceeded with iron resolutions in those plans of reform which he judged essential to the stability of the empire; and the disastrous termination of the succeeding war with Russia (1828–29), far from interfering with his projects, only stimulated him to renewed exertion. The successful revolt of the Greeks, and the late triumph of the Russians, together with the disaffection manifested by the Christian population of Turkey, excited in the ambitious mind of Mehemed Ali, pasha of Egypt, the desire for independence. See MEHEMED ALI. The war which ensued was from first to last in favor of the Egyptians; but the intervention of Russia compelled both parties to agree to a treaty (1833) which was satisfactory to neither. Mahmud was now forced to grant fresh concessions to his "good friend and ally" the czar, by the treaty of Unkiar-Skelessi (q.v.), July 8, 1833, and by another treaty in the following year. He was again at liberty to pursue his reforms in the civil administration, the principal improvements being the modification and readjustment of the more oppressive taxes, the formation of a militia on the principle adopted by England, the establishment of schools of anatomy and painting, increased privileges to Frankish merchants, and the abolition of the export duty on grain, measures of sound policy, which tended largely to consolidate the new-born prosperity of Turkey. In 1838 he concluded with Great Britain a commercial treaty, which both strengthened the connection between the two nations and advanced their mercantile interests. In 1839 he renewed the war with Mehemed Ali, but died before its conclusion, July 1, 1839, after an eventful reign of 31 years.

MAHOGANY, the wood of the trunk of the *swietenia mahagoni*, a tree of 80 to 100 ft. high, belonging to the natural order *cedrelaceæ*, a native of the West Indies and of South America. It has pinnate leaves with 3 to 5 pairs of leaflets, and panicles of small whitish or yellow flowers, the stamens united into a tube which is toothed at the summit, and set round on the inside with 8 to 10 anthers. The capsule is 5-celled, about the size of a man's fist, hard, woody, and oval, and the seeds are winged at the apex. It

attains an immense size, second to few others, and its timber is generally sound throughout in the largest trees. The slow progress which it is observed to make, clearly indicates that the trees which are cut for use must have attained a great age: 200 years has been assumed as an approximation. It is most abundant on the coast of Honduras and around Campeachy bay, whence the greater portion of that used in Europe is exported. St. Domingo and Cuba also yield a considerable quantity, which is of a finer quality than that obtained from the mainland, which is frequently called bay wood, to distinguish it from the Cuba mahogany, usually called Spanish. The occupation of cutting this timber and removing it to the coast for shipment is exceedingly laborious, and employs a large number of men and oxen. The wood varies much in value, according to the color and beauty of curl; singie logs have occasionally realized as much as £1000 for cutting into veneers, in which state it is very generally used, its great weight and value unfitting it for being always employed solid. It was first introduced into England by accident in 1597, having been used to repair one of sir Walter Raleigh's ships at Trinidad; but although the wood so employed was much admired, it did not become an article of commerce until rather more than a century later, when another accidental circumstance brought it into demand, and it became an article of luxury, and has since maintained the highest position as a cabinet-maker's wood. The annual imports into Britain are over 50,000 tons, exceeding half a million sterling in value. The bark has a faint aromatic smell, and a very astringent bitter taste, and in the countries where the tree grows is used as a medicine. In England it has been recommended and used under the name *mahogany bark*, or *amaranth bark*, as a substitute for Peruvian bark.—EAST INDIA MAHOGANY is the timber of the *rohuna tree* (*soymida febrifuga*), and AFRICAN MAHOGANY of the *khaya senegalensis*, both of the order *cedrelaceæ*.

MAHOMET. See MOHAMMED, *ante*.

MAHON, Viscount. See STANHOPE, EARL, *ante*.

MAHONE, WILLIAM, b. in Southampton, Va., about 1827, and graduated at the Virginia military institute in 1847; adopted the profession of a civil engineer; constructed the Norfolk and Petersburg railroad; assisted in the capture by the rebels of the Norfolk navy yard, April 21, 1861; raised and commanded a regiment of Virginia soldiers in the confederate army; was in most of the battles of the peninsular campaign, and in command at Bermuda Hundred at the time of Lee's surrender. He was promoted to the rank of maj.gen. in 1864. After the war he was engaged in the management of several lines of railroad in Virginia. In 1880 he was elected to the senate of the United States as the successor of Robert E. Withers. The question of the extinguishment of the public debt, which was complicated by the relations of Virginia and West Virginia, had been at issue during every year since 1873, when terms for its equitable adjustment had been agreed upon. These terms, however, not proving satisfactory to a large proportion of the population of the state of Virginia, were not carried out, and two strong parties were formed under the names, respectively, of "debt-payers" and "readjusters," of the latter of which gen. Mahone became the leader and the most active spirit. The "readjusters," while recognizing the just liability of Virginia for her just debts, denied the right of her taxation for that portion of the debt which should attach to West Virginia, opposed over-taxation, declared in favor of the protection of the public free schools, and advocated reform and economy.

MAHO'NIA. See BARBERRY.

MAHO'NING, a co. in n.e. Ohio, watered by the Mahoning and Little Beaver rivers, and intersected by the Atlantic and Great Western, and Pittsburg, Fort Wayne, and Chicago railroads; 423 sq.m.; pop. '80, 42,867. The surface is undulating, and the soil very fertile. The productions are: wheat, Indian corn, potatoes, oats, hay, wool, butter, flax, and flax-seed. There are a number of iron foundries and furnaces, rolling mills, flour mills, saw mills, and tanneries. Co. seat, Canfield.

MAHO'NY, FRANCIS, 1805–66; b. Ireland; educated at the Jesuit college in Paris, and at Rome, where he entered the priesthood of the Roman Catholic church. He tried, but in vain, to find employment in his profession; and he then went to London, and devoted himself to literature and journalism. He contributed to *Fraser's Magazine* for 1836, under the pseudonym of "Oliver Yorke," a series of papers which were afterwards published in book form as *The Reliques of Father Prout*. They are conceived in the spirit of Wilson's *Noctes Ambrosianæ*, and show considerable learning and humor, and a talent for comic verse and parody. He was the first Roman correspondent of the *Daily News*, and his letters from Rome to that journal were published in 1849 under the name of *Facts and Figures from Italy*. He lived at Paris for many years as correspondent of the London *Globe*, but in 1864 he entered a monastery, where the last two years of his life were passed.

MAHOPAC', LAKE, one of a group of 22 lakes in Putnam co., N. Y., 1800 ft. above the level of the sea, 9 m. in circumference, a favorite resort for summer excursionists. It is in the midst of picturesque scenery, and offers advantages of good boating and fishing.

MAHRAT'TAS, a people of Hindu race, inhabiting central India, s. of the Ganges, from Gwalior to Goa, and supposed by many to be the descendants of a Persian or North

Indian people, who had been driven southwards by the Mongols. They are first mentioned in history about the middle of the 17th c., when they possessed a narrow strip of territory on the w. side of the peninsula, extending from 15° to 21° n. latitude. The founder of the Mahratta power was Sevaji, a freebooter or adventurer, whose father was an officer in the service of the last king of Bejapûr. By policy or by force he eventually succeeded in compelling the several independent chiefs to acknowledge him as their leader, and with the large army then at his command overran and subdued a large portion of the emperor of Delhi's territory. His son and (1680) successor, Sambaji, after vigorously following out his father's policy, was taken prisoner by Aurungzebe in 1689, and put to death. The incapacity of the subsequent rulers who reigned under the title of *ramrajah* ("great king"), tempted the two chief officers of state, the *peishwa*, or prime minister, and the paymaster-gen., to divide the empire between them. This was effected about 1749, the former fixing his residence at Poona, and retaining a nominal supremacy over the whole nation of the Mahrattas; while the latter made Nagpûr his capital, and founded the empire of the Berar Mahrattas. This paction, of course, required the sanction of the more important among the minor chiefs and officers of state, who gave their consent on condition of receiving a share of the spoil. The ultimate result was the partition of the Mahratta kingdom into a great number of states, more or less powerful and independent; chief among which were, besides the two above mentioned, Gwalior, ruled by the Rao Scindia; Indore, by the Rao Holkar; and Baroda, by the Guicowar. It was to be expected that the usual intestine wars would supervene, and ultimately the East India company was compelled to interfere. The invasion of the Delhi empire by Nadir Shah afforded these wild and warlike mountaineers an opportunity, of which they eagerly availed themselves, to wrest additional territory from the feeble grasp of the Mogul emperor. From this time they discharged the office of arbiters in the quarrels between the emperor, his vizier, and his rebellious subjects; but the frightful defeat (Jan., 1761), they sustained at the hands of Ahmed Shah Abdalli, the ruler of Afghanistan, on the field of Paniput, where they lost 50,000 men, and all their chiefs except Holkar, weakened their power for a time. They still, however, continued to be the hired mercenaries of the Delhi emperor, till the growing influence of the British compelled them to look to their own safety. After many long and bloody contests with the British and their allies, in which sometimes the whole, but more frequently a portion of the Mahrattas joined, they were one by one, with the exception of Scindiah, reduced to a state of dependence. This last-mentioned chief, having raised a powerful army, officered by Frenchmen, and disciplined after the European method, continued the contest for a number of years, till his power was finally broken in 1843. The dignity of Peishwa was abolished in 1818, and his territories were occupied by the British, with the exception of a portion which was made over to another Mahratta chief, the Rajah of Sattara, their faithful ally; Nagpûr and Sattara subsequently reverted to the British government, but the other chiefs still possess extensive dominions, under British protection.

The Mahrattas are a vigorous and active race, and though diminutive and ill-formed are distinguished for their courage. They are of a cruel and perfidious disposition, and have exercised a most disastrous influence upon the inhabitants of the countries they have conquered. Though devout worshipers of Brahma, no distinctions of caste exist among them.

MAI, ANGELO, CARDINAL, a distinguished editor and scholar, was born in the village of Schilpario, in Lombardy, Mar. 7, 1782. He was educated and lived till 1808 in establishments belonging to the Jesuits; but obtained an appointment, first as associate, and ultimately as doctor, in the celebrated Ambrosian library at Milan. His career as an author dates from this appointment. In 1813 he published a translation and commentary of Isocrates, *De Permutatione;* but his reputation is due much more to his publications of the palimpsests or re-written manuscripts, the first specimens of which he issued at Milan (see PALIMPSEST). His earliest publications in that line were fragments of *Cicero's Orations;* of the *Vidularia*, a lost play of Plautus; of *Letters of Fronto*, Marcus Aurelius's preceptor; the *Chronicon* of Eusebius, and other less important works, which, however, were entirely eclipsed by his well-known edition and restoration of the *De Republica* of Cicero, published in 1820. Meanwhile, Mai had been invited to Rome by Pius VII., and named to the charge of the Vatican library, together with other honorable and emolumentary appointments. He at once turned his attention to the unedited MSS. of the Vatican, and after a short examination of this noble collection, undertook, as the mission of his life, the task of publishing those among them which had been overlooked by earlier editors, or had escaped their notice. This task he steadily pursued; and although he was appointed, in 1833, to the onerous office of secretary of the propaganda, and, in 1838, to the cardinalate itself, his Roman publications form a collection of an extent and importance almost unexampled in modern times. His first series was in 10 4to vols., entitled *Scriptorum Veterum Nova Collectio, e Vaticanis Codicibus edita* (Rome, 1825). It consists, like the great collections of Mabillon, Montfaucon, D'Achery, and others, of miscellaneous unpublished works, partly sacred, partly profane, and indifferently in the Greek and the Latin languages, comprising an entire volume of palimpsest fragments of the Greek historians, Polybius, Diodorus, Dion,

Dionysius, and others. The succeeding collections, viz., *Classici Auctores ex Codicibus Vaticanis* (10 vols. 8vo, 1838), *Spicilegium Romanum* (10 vols. 8vo, 1839–44), and *Nova Patrum Bibliotheca* (6 vols. 4to, 1853), are all on the same plan, and all equally replete with new and interesting materials. For many years, too, he was engaged in preparing an edition of the celebrated *Codex Vaticanus*, which he had printed, but the publication of which was postponed, awaiting the preparation of his intended preliminary dissertations. He died, however, rather unexpectedly, at Albano, Sept. 8, 1854; and as no trace of the expected preliminary matter was found among his papers, the edition was published (1857) entirely without critical matter. It has, in consequence, disappointed expectation. His library, which he directed to be sold for the use of the poor of his native village, was purchased by the pope for the Vatican library.

MAIDEN, THE, a name given to a machine for beheading criminals, which was in use in Scotland from about the middle of the 16th c. to nearly the end of the 17th century. It is said to have been introduced into Scotland by the regent Morton, who had seen it at Halifax, in Yorkshire, and was himself the first to suffer by it, whence the proverb, "He that invented the maiden first handselled it." Morton, for anything that is known to the contrary, may have introduced the maiden; but he certainly was not its first victim. Fifteen years before he was put to death by it (1581 A.D.) it was employed to behead Thomas Scott of Cambusmichael, one of the murderers of Rizzio (1566 A.D). It would seem at first to have been called indifferently "the maiden" and "the widow"—both names, it may be conjectured, having their origin in some such pleasantry as was glanced at by one of the maiden's last victims, the earl of Argyle (1681 A.D.), when he protested that it was "the sweetest maiden he had ever kissed." A frightful instrument of punishment used in Germany in the middle ages was called "the virgin." But it had no resemblance to the maiden, which was exactly like the French guillotine (q.v.), except that it had no turning-plank on which to bind the criminal. The maiden which was used in the Scottish capital is now in the museum of the antiquaries of Scotland at Edinburgh. A figure of it is given in the article GUILLOTINE.

MAIDENHAIR (*Adiantum Capillus-Veneris*), a small, delicate, and graceful fern, with bipinnate fronds, alternate obovate and wedge-shaped membranaceous pinnules on capillary stalks, and marginal *sori* hidden beneath oblong *indusia;* growing on moist rocks and old walls, especially near the sea; rare in Britain, but very abundant in the south of Europe, where it covers the inside of wells and the basins of fountains (as at Vaucluse) with a tapestry of the most delicate green. Another species of the same genus, *A. pedatum*, a native of North America, with *pedate* leaves, has a sweet, fragrant root-stock, of which *Capillaire* (q.v.) is made. It is supposed that the name maidenhair originated in the use of a mucilage made from this fern by women for stiffening their hair. This name is sometimes applied also to some species of spleenwort (*Asplenium*), as *A. adiantum nigrum* and *A. trichomanes.*

MAIDENHEAD, a municipal borough and market-town of England, in the county of Berks, is situated amid beautiful scenery, on the right bank of the Thames, 26 m. w. of London. It carries on some trade in meal, malt, and timber, and has a large brewery. Pop. '71, 6,173.

MAIDS OF HONOR. See LADIES OF THE QUEEN'S HOUSEHOLD.

MAID'STONE (old form, *Medwegston*), the county town of Kent, England, on the right bank of the Medway, 43 m. from London by the south-eastern railway. It is a municipal and parliamentary borough, and return 2 members to parliament. It stands in a noted corn-district; its grain-market is the most important in the county; and in the vicinity are the famous hop-grounds known as "the middle growth of Kent." The parish church, built toward the close of the 14th c., in the perpendicular style, contains many interesting tombs. The remains of the college or hospital of All-Saints, which grew out of a hospital founded in 1260 at the entrance of the town for the benefit of pilgrims traveling to Canterbury, are highly picturesque. Maidstone has numerous educational and other institutions. An extensive oil, and several paper mills, sacking and twine manufactories, and several breweries, are in operation. Pop. of parliamentary borough '71, 26,237.

MAI'GRE, *Sciæna aquila*, a fish of the acanthopterous family *sciænidæ*, common in the Mediterranean sea, but a rare visitant of the British shores. It attains a large size, being seldom taken less than 3 ft., whilst it is sometimes 6 ft. long. In general appearance it much resembles a large bass, but the head is shorter and more rounded, and the tongue and roof of the mouth are destitute of teeth. The maigre is in very high esteem for the table, and the head is a favorite delicacy of epicures. The strength of the maigre is such that a stroke of its tail will throw down a man; and when it is taken, the fishermen therefore quickly stun it by a blow on the head. It is one of those fishes which emit a peculiar sound, which has been described as a kind of purring or buzzing, and has been heard from a depth of 120 feet. Fishermen have been guided by this sound to let down their nets so as to inclose a number of maigres. The maigre appears to be the *umbrina* of the Romans, and was highly esteemed by them. The stones of its ears were formerly set in gold, and worn on the neck, imaginary virtues being ascribed to them,

particularly in the cure of colic; but it was requisite that they should be obtained as a gift, and not by purchase.

MAIL (Fr. *maille*, It. *maglia;* from the Lat. *macula*, a spot, hole, or mesh of a net) signifies a metal net-work, and is ordinarily applied to such net-work when used as body defensive armor. Well-made mail formed an admirable defense against all weapons except firearms, and its pliability and comparative lightness gave it favor over the more cumbrous plate-armor.

MAIL. See POST-OFFICE.

MAILED CHEEKS, *Sclerogenidæ* or *triglidæ*, a family of acanthopterous fishes, distinguishingly characterized by an enlargement of certain bones of the head and gill-covers to form a bony armor for the cheeks. They exhibit great variety of forms; some of them are remarkable for their elegance and for their delicate or splendid hues, other for their extreme ugliness. Gurnards (q.v.) are among the best known and most valuable of this family. To it belong also bull-heads (q.v.) and *scorpænæ* (q.v.). Stickle-backs (q.v.) are sometimes referred to it. The species are widely distributed in the seas of all parts of the world; a few inhabit lakes and rivers.

MAIMATCHIN, a trading t. on the northern boundary of Mongolia, opposite Kiahta (q.v.).

MAIMING is the shooting, stabbing, or otherwise seriously injuring of a person, and therefore, when treated as a criminal offense, properly belongs to the heads of assault, attempt to murder, and offenses against the person generally. Maiming cattle is classed under the head of malicious injuries to property.

MAIMON'IDES, or rather MOSES BEN MAIMON (RAMBAM=RABBI MOSES BEN MAIMON) B. JOSEPH B. ISAAC B. JOSEPH B. OBADJAH, etc.; Arab. ABEN AMRAN (AMRU) MUSA IBN ABDALLAH IBN MAIMON AL-KORTOBI, was b. at Cordova, Mar. 30, 1135. Little is known of his early life, which fell in the troublous period of the Moravide rulers. His first instruction he received at the hand of his father, himself a learned man, and author of several important works in Arabic and Hebrew. Under the guidance of the most distinguished Arabic masters of the time, Maimonides then devoted himself to the study of Greek (Aristotelian) philosophy, the science of medicine, and theology. When, in 1148, Abd-al-Mumen, the successor of Abdallah, in the newly established reign of the Al-Mohads (Unitarians), took Cordova, and, shortly afterwards, subjected all Andalusia, both Jews and Christians residing there were forced either to profess Islam or to emigrate. Maimonides's family, however, together with many others to whom emigration was well-nigh impossible, outwardly embraced the Mohammedan faith, or rather for the time being renounced the public profession of Judaism, all the while remaining faithful to it in secret, and keeping up a close communication with their co-religionists abroad, an arrangement in which the government readily acquiesced, since it fully answered their purpose. For more than 16 years Maimonides thus lived together with his whole family under the assumed character of Mohammedans; but when the death of the reigning sovereign brought no change in the system of religious intolerance, they resolved to emigrate. In 1165 they embarked, went to Acco, and, by way of Jerusalem, to Cairo, where Maimonides's father died. Maimonides settled in Fostât (Old Cairo), where for some time he gained his livelihood by the jewel-trade, until his great medical knowledge procured him the high office of physician to Salah Eddin, the reigning sultan of Egypt. Maimonides's importance for the religion and science of Judaism, and his influence upon their development, is so gigantic, that he has rightly been placed second to Moses, the great law-giver, himself. He first of all brought order into those almost boundless receptacles of tradition, and the discussions and decisions to which they had given rise, which, without the remotest attempt at system or method, lie scattered up and down the works of Haggada and Halacha—Midrash, Mishnah, Talmuds. Imbued with the spirit of lucid Greek speculation, and the precision of logical thought of the Arabic Peripatetics Maimonides, aided by an enormous knowledge, became the founder of rational Scriptural exegesis. The Bible, and all its written as well as implied precepts, he endeavored to explain by the light of reason, with which, as the highest divine gift in man, nothing really divine could, according to his theory, stand in real contradiction. The miracles themselves, though not always traceable to their immediate cause, yet cannot be wrought in opposition to the physical and everlasting laws in nature. Where literal interpretation seems to jar upon the feelings of reverential awe towards the Highest Being, there an allegorical explanation is to be adopted unhesitatingly. Respecting Maimonides's philosophical system, we can barely hint in this place at its close similarity with that of Averroes; both drawing from the same classical sources, and arriving independently, and with individual modifications, to nearly the same views on the great problems of the universe. Holding reason in man—if properly developed and tutored by divine revelation—to be the great touch-stone for the right or wrong of individual deeds, Maimonides fully allows the freedom of will, and while he urges the necessity, nay, the merit of listening, to a certain degree, to the promptings of nature, he rigorously condemns a life of idle asceticism, and dreamy, albeit pious contemplation. No less is it, according to him, right and praiseworthy to

pay the utmost attention to the healthy and vigorous development of the body and the care of its preservation by the closest application to hygienic rules. Providence, Maimonides holds, reigns in a certain—broad—manner over humanity, and holds the sway over the destinies of nations; but he utterly denies its working in the single event that may befall the individual, who, subject above all to the great physical laws, must learn to understand and obey them, and to shape his mode of life and action in accordance with existing conditions and circumstances—the study of natural science and medicine being therefore a thing almost of necessity to everybody. The soul, and the soul only, is immortal, and the reward of virtue consists in its—strictly unbodily—bliss in a world to come; while the punishment of vice is the "loss of the soul."

Maimonides's first work of paramount import (several of his earlier minor writings treat of subjects of general science), begun in his twenty-third year, and finished ten years later, is his Arabic commentary of the Mishnah [translated in Hebrew by Judah Alcharisi, Tibbon (father and son), Salben Jacob, Net, Almâli, Jak. Akkasi, and others], which forms an extensive historical introduction to *Tradition*, or the Oral Law: tracing its development, its divisions, the plan of the Mishnah, and its complements, etc.; and this introduction has now, for more than five hundred years, been deemed so essential a part of the Talmud itself, that no edition of the latter is considered complete without it. This was followed by the *Sefer Hammizwoth*, or Book of the Precepts, in Arabic (translated into Hebrew by Abr. Ibn Chasdai, and, from the author's second edition, by Moses Tibbon), which contains an enumeration of the 613 traditional laws of the Halacha, together with 14 canons on the principle of numbering them, chiefly directed against the authors of certain liturgical pieces called *Asharoth* (Warnings); besides 13 articles of belief, and a psychological fragment. This book is to be considered chiefly as an introduction to the gigantic work which followed in 1180, under the title of *Mishne Thorah* (Second Law), or *Yad Chasakah* (Strong Hand), a Hebrew compendium in 982 chapters, embracing the entire Halacha, even those of its parts no longer in practical use, such as precepts regarding the soil of Judæa and the like, and which, with the most astounding minuteness, lucidity, and precision, places the results of the legal disquisitions gathered from the Talmudical labyrinths systematically arranged before the reader. The summit of his renown, however, Maimonides reached in his grand Arabic work, *Delalath Al-Hairin* (Heb. Moreh Nebuchim, "Guide of the Erring"), a philosophical exegesis (translated into Hebrew by Samual Tibbon, edited for the first time in the original by Munk, 1856, etc.), which, while on the one hand it has contributed more than any other work to the progress of rational development in Judaism, has on the other hand also become the arena for a long and bitter fight between orthodoxy and science—carrying out, as it did, to its last consequences the broad principle, that "the Bible must be explained metaphorically by established fundamental truths in accordance with rational conclusions." So bitter, indeed, was the contest which broke out between the subsequent spiritualistic Maimonidian and the "literal Talmudistic" schools, that the fierce invectives were speedily followed by anathemas and counter-anathemas issued by both camps; and finally, about the middle of the 13th c., the decision was transferred into the hands of the Christian authorities, who commenced by burning Maimonides's books, continued by bringing to the stake all Hebrew books on which they could lay their hands, and followed this decision up by a wholesale slaughter of thousands upon thousands of Jews, men, women, and children, irrespective of their philosophical views. Under these circumstances, the antagonistic parties, chiefly through the influence of David Kimchi and others, came to a reconciliation, and withdrew their mutual anathemas; and, as time wore on, Maimonides's name became the pride and glory of the nation, who bestowed upon him terms like the "Great Eagle," the "Light of Two Worlds," etc. Nor was his immense celebrity confined to the narrow pale of his own creed; as early as the 13th c. already, portions of his works, chiefly the *Moreh* (Doctor Perplexorum), became, in Latin versions, the text-books of European universities.

Maimonides himself only witnessed the beginning of the conflict, the proportions and violence of which he certainly never anticipated. At his death, which took place Dec. 13, 1204, the grief at the loss of the "Light of the Age" was universal in the east as well as in the west. And he has ever since been recognized universally as one of the noblest and grandest men of all times: gifted with the most powerful and brilliant qualities of mind, possessed of the most varied and astounding knowledge, and imbued with deep piety and true religion, borne aloft by undaunted energy and glowing zeal. His body was brought to Tiberias, and his tomb became a place of pilgrimage, even to his early foes.

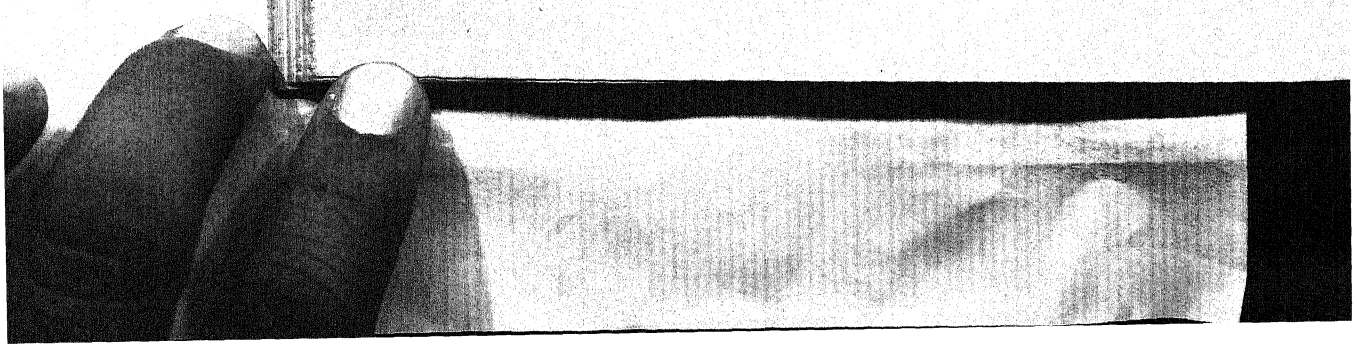
Of Maimonides's smaller works, we may enumerate, in conclusion, a translation of Avicenna's *Canon;* an extract from Galen; several medical, mathematical, logical, and other treatises, spoken of with the highest praise by Arabic writers; legal decisions, theological disquisitions, etc. Portions of his great work, *Moreh*, have lately been translated into modern European languages, chiefly into German (Scheyer) and French (Munk).

MAIN (from the Latin *magnus*, great), the name applied on shipboard to the principal mast, and to all the parts belonging or adjacent to it—as, maintopmast, main-yard, main-stay, main-shrouds, main-hatchway, main-chains, etc.

MAIN, a river of Germany, the largest affluent the Rhine receives from the right, is formed by the union of two branches, the White and Red Main, 4 m. below Kulmbach, in Bavaria. The more important of these, the White Main, rises in the Fichtelgebirge, 2,800 ft. above sea-level. The Main has a winding westward course 300 m. in length, to the Rhine, into which it falls at Mainz. It is navigable for the last 220 miles. The principal towns on its banks are Schweinfurt, Würzburg, Aschaffenburg, Offenbach, and Frankfort; and its chief affluents are, on the right, the Saale, and on the left, the Regnitz. The Main is one of the most picturesque of German rivers; it flows through a beautiful country, where the hill-slopes are frequently covered with vineyards, and surmounted by castles. Its waters communicate with those of the Danube by means of the Ludwigs-Kanal. See BAVARIA.

MAINE, the most eastern of the five New England states in America, extends from lat. 42° 57′ to 47° 32′ n., and from long. 66° 52′ to 71° 6′ w., being 303 m. from n. to s., and 212 from e. to w., with an area of 35,000 sq.m., or 22,400,000 acres. Maine is bounded n. by Quebec, e. by New Brunswick, s. by the Atlantic ocean, and w. by New Hampshire and Canada. It has, on the s., a coast-line of 278 m. in a line, but so indented with bays as to make 2,486 miles. The largest of these bays are the Penobscot, Machias, Saco, Passamaquoddy, etc. Into these empty the rivers Penobscot Kennebec, Saco, Androscoggin, etc. Numerous islands stud the coast: the largest, Mount Desert, remarkable for its scenery, contains 60,000 acres. In the northern portions of the state are numerous lakes; the largest, Moosehead, being 35 m. long, and the source of the Kennebec river. The country is hilly, with a range of mountains stretching n.e. from the White mountains of New Hampshire; Mount Katahdin, near the center of the state, is 5,383 ft. high. On the coast are fine granite quarries; interior, metamorphic rocks and minerals, limestone and argillaceous slates. The climate ranges from 20° or 30° below to 100° above zero. The forests are rich in pine, spruce, hemlock, maple, etc.; and the chief agricultural products are potatoes, maize, oats, hay, barley, and apples. The rivers and coast abound in fish. One of the chief exports is lumber, and one-third of all the ships of America are built on the rivers and harbors of this state. The falls of the rivers furnish immense water-power for saw-mills and factories. Maine has over 1000 m. of railway, 64, banks, 4,565 public schools, 5 colleges, a theological hall, and 2 medical schools. The government consists of a governor, senate, and house of representatives, elected by universal suffrage. Maine was settled in 1621, and was a part of Massachusetts until 1820. In its early history it is said that every 20th settler was killed by the Indians. A controversy respecting the north-eastern boundary of Maine, which threatened to produce war with England, was settled by a compromise of claims in 1842. The chief towns are Portland, Augusta (the capital), Bangor, Bath, Hallowell, etc. Pop. in '60, 628,276; in '70, 626,915.

MAINE (*ante*). The Northmen discovered the coast, as is now generally conceded, as early as 990, visiting it occasionally until the middle of the 14th c., but founded no settlement upon it. From 1350 to 1498, the time of Cabot's second expedition, there is no evidence that the coast was seen by any European. In 1524 it was visited by a French expedition, under Verrazano; in 1525 by the Spaniards, under Gomez, and, in 1527, by the English, under Rut; but none of these made any settlement. In 1556 a Roman Catholic priest, André Thevet, entered Penobscot bay, remaining five days, and holding numerous conferences with the natives, but without any immediate result. The first attempt to settle upon the territory was that of the French, under Du Mont, who in 1604 planted a colony on Neutral island in the river St. Croix, which was abandoned the following year. In 1605 capt. Weymouth explored a part of the coast, and was followed in 1607 by the expedition sent out by sir John Popham and sir Ferdinando Gorges, which, under a charter from king James, made a settlement at the mouth of the Kennebec. This colony, however, returned to England in the following year. In 1613 the French Jesuits established a mission on Mt. Desert island, but were soon driven off by the English. In 1616 Richard Vines, an agent of sir F. Gorges, went with a small company to Saco, to remain during the winter and explore the surrounding region; while a company of fishermen, under capt. John Smith, took possession of Monhegan island, ranged the whole coast to Cape Cod, and prepared a map of the country, to which he gave the name of New England. In 1620 James I. divided the territory conveyed by the charter of 1606, granting to the Plymouth company the portion lying between the 40th and 48th degrees of n. lat., and to the Virginia company the whole region s. of the 48th degree. In 1622 Gorges and capt. John Mason obtained from the Plymouth colony a grant of the territory lying between the Merrimac and the Kennebec rivers, and in 1623 planted a colony at the mouth of the Piscataqua, which was the first permanent settlement of the main land in Maine. Gorges and Mason divided these possessions between them, the former taking the portion e. of the Piscataqua, and the latter that w. of the same river. In 1624 Gorges established a colony at York, and in 1625 Pemaquid was occupied under grants from the Plymouth company. After 1630 settlements were made at Saco, Biddeford, Cape Elizabeth, Portland, and Scarborough, which flourished until 1675, when they, in common with those between the Kennebec and the Penobscot, were destroyed by the Indians. The whole country e. of the Penobscot was claimed by the French, and little improvement was made there until after the revolutionary war. In 1635 the



portion of the Plymouth company's territory lying between the Piscataqua and the Kennebec was assigned to Gorges, who, after 1639, established a government over it under the name of Maine, which continued till 1677, when the territory was sold to Massachusetts for the sum of £1250. King Philip's Indian war began in Maine shortly before this time, and was attended with all the horrors of a conflict with an uncivilized and deeply angered people. During the next eighty-five years the white settlers were in constant terror of Indian raids. In 1647 Gorges died, and in 1664 the territory between the Kennebec and the Penobscot was granted by Charles II. to his brother James (then duke of York, afterward James II.), who established a government at Pemaquid, where he erected a strong fort. This country, however, was surrendered to Massachusetts in 1686, and her title thereto and to all the territory e. to the St. Croix and Nova Scotia was confirmed by the provincial charter of 1691. Between 1687 and 1689, Andros, the royal governor of the New England colonies, visited Maine, and practiced great extortion upon the inhabitants. By the treaty of 1783, at the conclusion of the revolutionary war, Massachusetts obtained possession of the territory and exercised jurisdiction over it as "the district of Maine" (often known as "the province of Maine") until 1820, when it was admitted to the union as an independent state. Its population at that time was 298,269. The growth of the state was steady from that time forward, the census of 1870 showing a population of 626,915, of whom 313,103 were males, and 313,812 were females; number of families, 131,017; of dwellings, 121,953; of persons over 10 years of age who could not read, 13,486, and of those who could not write, 19,052. The number of persons engaged in all occupations was 208,225, of whom 82,011 were engaged in agriculture, and in professional and personal services, 36,092, including 890 clergymen, 558 lawyers, 818 physicians and surgeons, and 4,183 teachers.

The surface of the state is much diversified, the sea coast being in large part flat, and at some points marshy. The chief exceptions to this are Mt. Agamenticus, 670 ft. high, near the s.w. coast; the Camden hills, 1500 ft. high, on the Penobscot, and the numerous peaks of Mt. Desert island and its vicinity, some of which rise to a height of over 2,000 feet. Back from the coast the country is hilly or mountainous. The great Appalachian chain, of which the White mountains of New Hampshire are a part, originates in the British province of New Brunswick, enters Maine at Mars hill in lat. 46° 30', crosses the state in a s.w. direction, and joins the White mountain range at the New Hampshire line. The highest elevation of this range in Maine is Mt. Katahdin, near the geographical center of the state, which is 5,385 ft. in height. The other principal elevations are Mt. Abraham, Mt. Blue, Sugar Loaf, Chase's mountain, Mt. Mattatuck, Mt. Puzzle, and Mts. Saddleback and Bigelow. The Ebene and Spencer mountains, trending southward, and the highlands on the n., are spurs of this range. The n. portion of the state is drained by the Walloostook and the Aroostook, which empty into the St. John. The St. Croix forms a portion of the boundary between Maine and New Brunswick and empties into Passamaquoddy bay. The largest river of Maine is the Penobscot, which, with its branches and connecting lakes, drains the center of the state, flows into Penobscot bay, and is navigable for large vessels to Bangor, more than 50 m. from its mouth. West of the Penobscot is the Kennebec, navigable to Bath, and furnishing unlimited water power; and further w. still are the Androscoggin, the Saco, and the Piscataqua, which latter separates Maine from New Hampshire. One of the most striking natural features of the state is presented in the great number of lakes, both small and large, whose surplus waters go to swell the volume of the principal streams. These lakes, together with the rivers, are estimated to cover an area of 3,200 sq. miles. The largest is Moosehead, 35 m. long and from 4 to 12 in breadth. Among the others are the Sebago, Umbagog, Chesuncook, Baskahegan, Eagle, Portage, Long, Madewaska, Pamedumcook, Millinoket, Sebec and Schoodic. The soil in the valleys is generally fertile, but comparatively sterile in the mountains. The winters are long and severe, but of uniform temperature, the snow lying upon the ground from three to five months of the year. The thermometer ranges in the course of the year from 30° below to 100° above zero. The most unpleasant feature of the climate are the n.e. winds of the spring and early summer, usually accompanied by chilly fogs.

The state, especially in Aroostook, Piscataquis, and Washington counties, is well supplied with minerals. Iron, lead, tin, copper, zinc, and manganese are found in considerable quantities, while the manufacture of alum, copperas, and sulphur might easily be made profitable. Marble, slate, and limestone are abundant, while granite of the finest quality is obtained in blocks weighing more than 100 tons each. The metallic ores have not been much worked. The principal state quarries are in Piscataquis county.

The great forests which long covered the central and northern portions of the state are fast falling before the lumberman's axe, with the effect, as some believe, of a very serious diminution of the rain-fall. The principal forest trees are the pine, spruce, hemlock, maple, birch, beech, and ash, and in some parts of the state the butternut, poplar, elm, and sassafras. Apples, pears, and plums are raised with success; but the summer is too short for the growth of peaches.

The forests are inhabited by the moose, bear, deer, wolf, catamount, wolverine, beaver, sable, weasel, squirrel, etc., while among the birds may be mentioned eagles, wild geese and ducks, owls, hawks, partridges, pigeons, crows, quails, and humming-

birds. Trout, salmon, and pickerel are abundant in the lakes and rivers; while the waters off the coast abound with cod, mackerel, herring, halibut, etc.

The number of farms in 1870 was 59,804, containing 2,917,793 acres of improved and 2,920,265 acres of unimproved land. The cash value of these farms was $102,961,951; of farming implements and machinery, $4,809,113; wages annually paid, $2,903,292; total value of farm productions and improvements, $33,470,044; value of orchard products, $874,569; of produce of market gardens, $366,397; of forest products, $1,581,741; of home manufactures, $450,988; of animals slaughtered or sold for slaughter, $4,939,071; of all live stock, $23,357,129. The amount of wheat raised in 1870 was 278,793 bushels; of corn, 1,089,888 bushels; of oats, 2,351,354 bush.; of rye, 34,115 bush.; of barley, 658,816 bush.; of buckwheat, 466,635 bush.; of potatoes, 7,771,363 bush.; of wool, 1,774,168 lbs.; of hops, 296,850 lbs.; of butter, 11,636,482 lbs.; of cheese, 1,152,590 lbs.; of maple sugar, 160,805 lbs.; of honey, 155,640 lbs.; of milk sold, 1,374,091 gallons. Number of horses, 71,514; of milch cows, 139,259; of other cattle, 142,802; of sheep, 434,666; of swine, 45,760.

The production of lumber is the leading industry. In 1870 the forests were estimated to cover nearly one-half the entire surface of the state; but so extensive is the lumber trade, that this area of forest is constantly diminishing. Bangor, on the Penobscot, is the chief lumber mart. The amount surveyed there in 1870 was estimated at 200,000,000 feet. The counties which are the chief centers of the traffic are Penobscot, Washington, Hancock, and Piscataquis. In the first two of these counties the capital employed amounted to $3,500,000. The number of sawmills was 1,099, employing 8,500 men and $6,614,875 of capital, and dispensing in wages $2,449,132, while the products amounted to $11,395,747. The other chief industries are ship-building, boots and shoes, fisheries, ice-gathering, tanning and currying, vegetable canning, brick, cotton goods, flouring and gristmill products, lime, machinery, mining, and quarrying, paper manufacture, and woolen goods. In 1873 the whole number of manufacturing establishments was 6,072; number of persons employed, 55,614, of whom a little less than one-third were women and children; capital invested, $48,808,448; wages paid, $16,584,164; annual value of products, $96,209,136 The products of the Maine fisheries in 1870 amounted to $979,610. In 1873, 861 vessels of 46,196 tons were engaged in the cod and mackerel fisheries, affording employment for 2,000 men. Lobsters and clams are taken in immense quantities along the coast. The canning of vegetables, lobsters and clams is extensively carried on, the whole value of such products in 1875 being estimated at $1,842,000. The product of cotton goods in the same year amounted to $12,151,750.

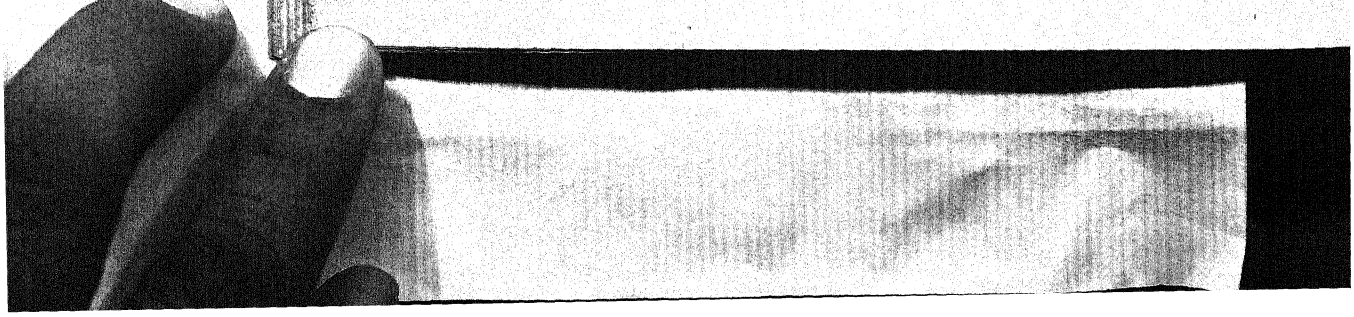
The numerous harbors of Maine offer the best facilities for commerce. Several of these harbors are among the best on the whole Atlantic coast; that of Portland especially is easy of access, deep, large, and well protected, and is often unobstructed by ice when harbors farther west and south are frozen over. The ports of entry are Houlton, Eastport, Machias, Ellsworth, Castine, Bangor, Belfast, Waldoborough, Wiscasset, Bath, Portland, Falmouth, Saco, Kennebunk, and York. The imports from foreign countries in 1873–74 amounted to $3,628,425; amount of exports in the same year, $5,372,102. The chief articles of import were coal, fish, sugar, iron, molasses, and wool; while those of export were cotton goods, canned vegetables, etc., boots and shoes, lumber, bacon, hams, and lard. The whole number of vessels entering from foreign countries in the same year was 750, of 363,196 tons burthen; number of clearances, 1,489, of 512,287 tons; number of registered, enrolled and licensed vessels, 3,221, of 585,842 tons. In the coasting and fishery trade were entered at the same time 2,291 vessels of 1,124,127 tons, and cleared 1,526 of 847,178 tons. In 1873 there were built in the state 276 vessels of 89,817 tons.

In 1875 Maine had 945 m. of railroad, controlled by 19 different corporations. The most important of these roads are the Atlantic and St. Lawrence, European and North American, Maine Central, Portland and Kennebec, and the Portland, Saco, and Portsmouth. Lines of steamers ply regularly between the largest cities of the state and Boston; also between Portland and New York, St. John, N. B., and Halifax; and in the winter between Portland, Liverpool, and Glasgow.

In 1874 Maine had 64 national banks, with a capital of $9,840,000, and an outstanding circulation of $7,946,576. The number of savings banks was 58, with $31,051,963 of deposits. There were at the same time 120 insurance companies doing business in the state. The public indebtedness of the state in 1875, after deducting the sinking fund held for its payment, was $5,574,378. The cash value of real and personal property in the state in 1874 was estimated at $254,000,000.

The public institutions are the insane hospital at Augusta, the state prison at Thomaston, the reform school near Portland, the industrial school for girls in Hallowell, the orphan asylum in Bangor, the military and naval orphans' asylum at Bath, and the Maine general hospital at Portland. There are no state institutions for the care of the deaf and dumb or the blind, but the state arranges for their care in the institutions of other states.

The permanent school fund, derived from the sale of wild lands belonging to the state amounts to about $370,000. The revenue for the support of public schools is derived in part from this fund and in part from taxation. The cost of maintaining



the schools in 1874 was $1,237,778, the sum being apportioned among the several towns according to the number of persons therein of school age. According to the latest reports, the number of persons in the state of school age was 225,219; registered in summer schools, 122,458, with an average attendance of 98,744; in winter schools, 132,333, with an average attendance of 108,478; number of school districts, 4,043; value of school property, $3,079,311; male teachers in summer, 161; in winter, 1,928; female teachers in summer, 4,366; in winter, 2,367; average wages of male teachers, per month, $36.17; of females, per week, $4.05. The legislature, several years since, established a system of free high-schools, the state defraying one-half the cost of instruction upon certain conditions. The system has worked well. The number of pupils enrolled in these schools in 1874 was 14,820; the amount paid by the state for their support, about $40,000. There are two normal schools, the western at Farmington, the eastern at Castine; tuition being free to those who agree to become teachers within the state. In 1873 the state appropriated $17,500 for the support of these schools. Maine has four colleges—Bowdoin college at Brunswick, founded in 1801; Colby university at Waterville (Baptist), founded in 1820; Bates college at Lewiston (Freewill Baptist), founded in 1863; and the state college of agriculture and the mechanic arts at Orono, founded in 1868, and receiving the avails of the public lands appropriated by congress for the purpose. The Congregationalists have a theological seminary, founded in 1820, at Bangor. There are also in the state several flourishing seminaries under the patronage of different religious sects. The number of libraries in the state in 1870 was 3,334, containing 984,510 volumes; of these, 1872, containing over 450,000 volumes, were private. The most important public libraries are the state library in Augusta, and those of Bowdoin college, the Portland institute, the Bangor theological seminary, the mechanics' association of Bangor, Colby university, and Bates college, respectively.

The number of newspapers and periodicals was 65, of which 7 were daily, 1 triweekly, 47 weekly, 1 semi-monthly, 8 monthly, and 1 quarterly. In 1874 the daily papers had increased to 9, the weeklies to 56. The religious organizations in 1870 numbered 1326, having 1102 edifices, and property valued at $5,196,853. The principal denominations were the Baptist, Congregational, Methodist, Freewill Baptist, Protestant Episcopal, Jewish, Christian, Roman Catholic, Second Advent, Unitarian, and Universalists. The legislature, composed of a senate of 31 members and a house of representatives of 151 members, elected on the 2d Monday of September, annually, meets at Augusta, the capital, on the first Wednesday in January. The governor (salary $2,500) is elected annually, and has the advice of a council of 7 members elected by the legislature on joint ballot. The supreme court, composed of 8 judges, is appointed by the governor and council for a term of 7 years, each judge receiving a salary of $3,000. The county of Cumberland, embracing the city of Portland, has a superior court of one judge, appointed in the same way. Probate judges are elected by the people of each county for terms of 4 years. Judges of inferior courts are appointed by the governor and council for terms of 7 years. The laws of Maine against the manufacture of and the traffic in intoxicating liquors are very strict, and supported by severe penalties. Liquors for medicinal, mechanical, and manufacturing purposes are sold in the several towns and cities by state agents appointed for the purpose. Husbands are not liable for debts contracted by their wives in their own name, but the latter may be sued for them. A wife may hold real and personal estate separately from her husband, and may convey or devise the same by will.

The electoral votes of Maine for president and vice-president of the United States have been as follows: 1820, 9 for Monroe and Tompkins; 1824, 9 for Adams and Calhoun; 1828, 1 for Jackson and 8 for Adams for president, and 1 for Calhoun and 8 for Rush for vice-president; 1832, 10 for Jackson and Van Buren; 1836, 10 for Van Buren and R. M. Johnson; 1840, 10 for Harrison and Tyler; 1844, 9 for Polk and Dallas; 1848, 9 for Cass and Butler; 1852, 8 for Pierce and King; 1856, 8 for Fremont and Dayton; 1860, 8 for Lincoln and Hamlin; 1864, 7 for Lincoln and Johnson; 1868, 7 for Grant and Colfax; 1872, 7 for Grant and Wilson; 1876, 7 for Hayes and Wheeler; 1880, 7 for Garfield and Arthur.

MAINE, one of the ancient provinces of France, immediately s. of Normandy, corresponds to the modern departments of Sarthe and Mayenne. Its chief town was Le Mans, now the capital of the department of Sarthe.

MAINE, Sir HENRY JAMES SUMNER, LL.D., b. England, 1822; educated at Pembroke college, Cambridge, and afterwards a tutor in Trinity college. In 1847 he was appointed regius professor of civil law in the university, but resigned in 1854 to become reader on jurisprudence at the middle temple. From 1862 to 1869 he resided in India as law member of the supreme government. This office he filled with high distinction, introducing many important legislative reforms. On his return to England he was elected professor of jurisprudence at Oxford, and the next year he was made a member of the council of the secretary of state for India, and was knighted. In 1875 he published as a pamphlet a lecture delivered at Cambridge on *The Effects of Observation of India on Modern European Thought.* In 1877 he was elected master of Trinity hall, and in 1878 resigned his professorship. Sir Henry published in the *Cambridge Essays* in 1856, *Roman Law and Legal Education;* but his other works are devoted to subjects upon which he is

of the highest authority, the origin and development of institutions, the condition of primitive society, and the growth of law and legal conceptions. His *Ancient Law* appeared in 1861; his *Village Communities* in 1871; *Lectures on the Early History of Institutions* in 1875; and *Modern Theories of Succession to Property* in 1878.

MAINE DE BIRAN, FRANÇOIS PIERRE GONTHIER, 1766–1824; b. France; was attached to the body-guard of Louis XVI., and in the latter part of 1789 was involved in some of the disturbances in Paris, but was not concerned in the revolution which followed. Under the first empire he was appointed to a sub-prefecture, and was a member of the legislature. He opposed the policy of Napoleon during the latter part of his reign, and became a legitimist with the advent of the restoration. He was made a deputy and a councilor of state, retaining his seat in the legislature from 1818. He wrote much in a philosophical vein, contesting the opinions of Condillac, and developing a system of his own which achieved a considerable reputation. M. Cousin edited an edition of his works which was published in Paris, 1841, in 4 vols.; and an account of his life and opinions appeared in 1857, written by Naville.

MAINE-ET-LOIRE, an inland department of France, forming a portion of the lower basin of the Loire, is bounded on the w. by the department of Loire-Inférieure, and on the e. by that of Indre-et-Loire. Area, 2,745 English sq. miles. Of which about 1,087,634 acres are arable, 197,748 in meadow, and 95,435 in vineyards. Pop. '72, 518,477. The surface is gently undulating. The soil is fertile, producing the usual crops, white and green, and a variety of excellent fruits. Wines, red and white, the latter comprising several highly esteemed varieties, are extensively cultivated; 11,000,000 gallons are made annually. Iron and coal mines are worked; and there are numerous mills and factories for the production of cotton, woolen, and linen goods. The department is divided into the five arrondissements of Angers, Baugé, Segré, Cholet (formerly Beaupréau), and Saumur. Capital, Angers.

MAINE LIQUOR LAW. See TEMPERANCE, *ante*.

MAI'NOTES, the inhabitants of the mountainous district of Maina, a peninsula between the bays of Kolokythia and Koron, forming part of the province of Laconia, in Greece. They have been regarded as the descendants of the ancient Spartans, whose land they now occupy; but more probably they are of Slavonic origin. They number about 60,000, and are a wild and brave race, but superstitious, and addicted to robbery. While the Turks held possession of Greece, the Mainotes were almost completely independent; and when not engaged in a common struggle against the Turks, their chiefs were at war with each other. The Mainotes, under their principal chief or bey, took a prominent part in the war for the liberation of Greece; but after the death of Mavromikalis, their last bey, their independence was destroyed.

MAINPRIZE, in English law, was a term denoting a security by which the bailer or mainpernor took the party bailed under his own personal charge or friendly custody, giving security to produce him at the time appointed. The practice is now obsolete, and superseded by bail (q.v.).

MAIN'TENANCE is a law term commonly used to denote an illegal succoring of a person, as by lending money to a stranger in carrying on law suits. Contracts are sometimes held to be illegal on this ground.

MAINTENANCE (*ante*), in law, an intermeddling by a person in a suit in which he is not concerned, as by giving money to another to carry on such suit, by hiring counsel for him, or assisting him in any unauthorized way. But persons between whom a certain relationship, or a certain relation created by law, exists, may give assistance to each other in suits in which they have respectively no interest. Thus, a husband may assist his wife, or a landlord his tenant. A lawyer may give professional assistance to a party in such suit, but he is not justified in giving pecuniary aid. The old common law rule in regard to the prohibition of maintenance has been greatly relaxed; and aid of the party to a suit is not now generally illegal. For instance, an agreement between a lawyer and his client to share the sum recovered in a particular suit is good, as a rule, in this country, though strictly prohibited by the older law. See CHAMPERTY.

MAINTENANCE, CAP OF, sometimes called *cap of dignity*, a cap of crimson velvet lined with ermine, with two points turned to the back, originally only worn by dukes, but afterwards assigned to various families of distinction. Those families who are entitled to a cap of maintenance place their crests on it instead of on a wreath. According to sir John Fearne, the wearing of the cap had a beginning from the duke or general of an army, who, having gotten victory, caused the chiefest of the subdued enemies whom he led to follow him in his triumph, bearing his hat or cap after him in token of subjection and captivity. Most of the reigning dukes of Germany, and various families belonging to the peerage both of England and of Scotland, bear their crests on a cap of maintenance.

MAINTENON, FRANÇOISE D'AUBIGNÉ, Marquise De, was the daughter of Constant d'Aubigné and of Jeanne de Cardillac, and granddaughter of Théodore Agrippa d'Aubigné, well-known for his writings, his attachment to Protestantism, and his energetic character. Françoise was born Nov. 27, 1635, in the prison at Niort, where her

father was then imprisoned. On obtaining his release, he went (1639) with his wife and daughter to Martinique in the West Indies, where he died in 1645. After her father's death, Françoise returned, with her mother, to France; and her mother also dying, her father's sisters took her under their care, and educated her in a convent, where her conversion to the Roman Catholic religion was accomplished at the age of about 14 years—after an obstinate resistance, in which the brave little child, to use her own words, *fateguait les prêtres la Bible à la main*. It is singular to reflect what a zealot she afterwards became. When she was 16, she became acquainted with the poet Scarron (q.v.), who, struck by her beauty, intelligence, and helpless condition, offered her his hand, or, if she should prefer it, a sum of money sufficient for her entrance into a nunnery. Although Scarron was lame and deformed, she chose to marry him, and now lived in the midst of the refined and intellectual society which frequented the house of the poet. On his death, in 1660, she was reduced to great poverty, and proposed to go as a governess to Portugal, when Madame de Montespan (q.v.) obtained her a pension from the king. Four years afterwards, she was intrusted with the education of the two sons whom Madame de Montespan had borne to Louis XIV., and in this capacity displayed a patient tenderness and sleepless care that no mother could have surpassed; and now becoming acquainted with the king, soon fascinated him, so that he bestowed on her 100,000 livres, with which she bought the estate of Maintenon; and at last she succeeded in supplanting Madame de Montespan. It is difficult to describe her relation to the king. She was not, it is believed, his *mistress* in the ordinary sense of the term, but from that time to the end of his life, she exercised an extraordinary ascendency over him. She had a passion for being thought "a mother of the church;" but while she confessed the strength of her desire to Romanize the Huguenots, she earnestly denied that she approved of the detestable *dragonnades*. In 1684, about 18 months after the death of the queen, Louis privately married her. She was much disliked by the people, but the courtiers sought her favor, and her creatures were made ministers and generals. In the midst of splendor, and in the possession of great power, she was confessedly very unhappy. She carefully brought up the children of Madame de Montespan; and it was at her instigation that Louis attempted to legitimize them. When he died in 1715, she retired to the former abbey of St. Cyr, which, at her wish, had been changed 30 years before, into a convent for young ladies. Here she died, April 15, 1719. She received to the end of her life, the honors of a king's widow. Her pretended memoirs are spurious, but her *Lettres* (9 vols. Amst. 1756, etc.) are genuine. By far the best edition is that published by M. Lavallée (1854 et seq.), entitled *Œuvres de Mme. de Maintenon publiées pour la première fois d'après les Manuscrits et Copies authentiques, avec un Commentaire et des Notes.*

MAINZ (MAYENCE, ancient *Moguntiacum*), the most strongly fortified city in the German empire, is situated in 50° n. lat., and 8° 10′ e. long., in one of the most fertile of the wine-bearing districts of Germany, having for its site a gentle slope on the left bank of the Rhine, near the junction of the Main. The pop. was in 1871, 53,918, including the garrison: in '75, 57,847. A floating bridge, resting on 49 pontoons, connects Mainz with the Rhenish village of Castel; as also a handsome railway bridge of iron, finished in 1864. The fortifications, which extend a length of nearly 10 m., consist of 14 principal and numerous lesser bastions, in addition to the four forts of Castel, Mars, Montebello, and Petersaue. In accordance with a decree of the congress of Vienna, Mainz was surrendered to the grand duchy of Hesse-Darmstadt in 1814, on condition that it was to constitute a German federal stronghold, and be garrisoned in common by Austrian, Prussian, and Hessian troops. In 1866, it became a Prussian fortress, and Prussia obtained all the rights that had hitherto belonged to the German confederation. By the treaty concluded at Versailles Nov. 15, 1870, the fortress of Mainz was declared an imperial fortress. Mainz which is one of the most ancient cities of Germany, retains many evidences of mediæval taste, and consists principally of narrow crooked streets; but of late years a new town has sprung up on the site of the ancient Roman city, and numerous sanitary improvements have been effected under the joint direction of the grand-ducal and civic authorities. Mainz has one Protestant and 10 Catholic churches, among the latter of which the most noteworthy are that of St. Ignacius, with its beautifully painted roof, and the cathedral, a memorable building, which was begun in 978, and after having been six times destroyed by fire, or through war, was restored by Napoleon. It has one great tower, 400 ft. in height, and 6 lesser towers, 14 altars, and 20 minor chaples. Mainz possesses numerous Roman remains, the most remarkable of which are the *Eichelstein*—a mass of stones supposed to be a memorial erected in honor of Drusus—and the ruins of a vast aqueduct at Zalbach. Mainz has a gymnasium, a seminary for priests, a normal school, a picture-gallery, museums, and a public library containing about 100,000 volumes. Among the industrial products of Mainz, which include artificial pearls, isinglass, tobacco, vinegar, soap, carriages, musical instruments, furniture, and articles in leather, the first and the last have acquired special reputation. Mainz from its position, necessarily enjoys a very important transit-trade, both by railway and river steam-navigation; and since the abrogation of many onerous restrictions, it has become one of the great internal ports for the corn and wine trade. The history of Mainz connects it with Rome from the year 13 B.C., when Drusus built on its site the

castle of *Maguntiacum;* but it owes its real importance to Charlemagne. It has acquired celebrity as the birthplace of Gutenberg (q.v.). In the 13th c. Mainz was head of the confederacy of Rhine cities: in 1468 the city was added to the domains of the archbishops of Mainz, who as such had precedence amongst the spiritual prince-electors of the empire. Mainz was several times in the possession of France, notably in 1801—1814.

MAI'PURES, or MAYPURES, the generic name of a number of Indian tribes of South America who live mostly on the Orinoco and Negro rivers. The best known tribe is the Moxos, who were conquered by the ancient Peruvians and were further advanced in civilization than the others, most of whom were cannibals. Many of the Moxos were converted to Christianity at an early date. A grammar and vocabulary of their language was written by father Pedro Marban in 1701.

MAISONNEUVE, JULES GERMAIN FRANÇOIS, b. Nantes, France, 1810. A distinguished physician and author of medical works; commenced practice in Paris in 1830; in 1835 opened a school for operative practice; and in 1840 became one of the surgeons of the hospitals and member of the society of surgeons. He has since been surgeon of the hospitals of *Cochin de la Pitié*, and in 1875 surgeon of the *Hotel-Dieu*. He ranks at the head of the brilliant school of modern surgery in France. His operations, inventions and improvements in surgical instruments have been remarkable. Though his courses in the hospitals are the most prized instructions in surgery, he has the disadvantage of being deficient in the use of language orally, though remarkably clear and concise in writing. His works are numerous, and of the highest authority of their date.

MAISONNEUVE, PAUL DE CHOMEDEY, Sieur de, b. in Champagne, France, early in the 17th c.; d. in Paris, 1676. In 1641 he led a colony of religionists to Canada and left them in Quebec; was himself made governor of Montreal, and founded that city in 1642, though the point had been named by Jacques Cartier seven years before. His administration was marked by energy and ability, and the good-will of the Indians. He resigned in 1669 and returned to France.

MAISTRE, JOSEPH DE, Comte, was b. 1753, in Chambéry, of a noble French family, which had settled in Savoy. While Savoy was occupied in 1792 by the French, Maistre, who was a member of the senate, withdrew from the country; and when the king of Sardinia, in 1799, was compelled to retreat to the island of Sardinia, Maistre accompanied his court, and in 1803 was sent as ambassador to St. Petersburg. In this post he remained until 1817, when he was recalled to occupy a place in the home government, and continued to reside in Turin till his death, Feb. 25, 1821. Maistre was an ardent advocate of legitimacy, and in his later career became one of the most eminent writers of the new (or liberal) conservative school in politics and religion, of which Chateaubriand may be regarded as the head. He had obtained some reputation as a writer at a very early period. His first work of note, *Considérations sur la France*, appeared in 1796. His later works were written either at St. Petersburg or after his return to Turin. They are: *Essai sur le Principe Générateur des Constitutions Politiques* (St. Petersburg, 1810); *Du Pape* (Lyons, 1821); *De l'Eglise Gallicane* (Paris, 1821–22); *Soirées de St. Petersbourg* (2 vols. 1822); and a posthumous work, *Examen de la Philosophie de Bacon* (Paris, 1836).

MAISTRE, XAVIER, Comte de, 1764–1862; b. in Chambéry, Savoy. When Savoy was conquered by the French during the first revolution, Maistre entered the Russian service and remained in it. During a visit to Italy in 1794 he was occupied with work in water-color and India ink drawings, and began in a desultory way the composition, entitled *Voyage autour de ma Chambre*, which has taken a place among the classics of French light literature. In 1811 his work entitled *Le Lépreux de la Cité de l'Aosta* exhibited his genius and his sympathy with real misery. *Prissoniers de Caucase* and *Prascovie, ou la Jeune Siberienne*, were translated and published in Philadelphia in 1826. The *Expedition nocturne autour de ma Chambre*, published 1825, was his last work. An edition of his works in three volumes appeared in Paris in 1823. He d. at St. Petersburg.

MAITLAND, a t. of New South Wales, in the co. of Northumberland, on the Hunter river, 95 m. n. of Sydney, and 20 m. n.w. of Newcastle, to which it is joined by railway. It is divided by the river into East and West Maitland. Pop. of Maitland, '61, 7,528; '71, 13,642. In either division are handsome banks, churches, and other public buildings. In West Maitland (much the more populous part of Maitland) are several coach-building factories, tobacco manufactories, and three mills (including a paper-mill). Good coal abounds in the neighborhood. The district has been called the "Granary of New South Wales."

MAITLAND, the name of a Scottish family, celebrated both in the literary and political history of their country. The first who acquired distinction was Sir RICHARD MAITLAND of Lethington, son of William Maitland of Lethington and Thirlstane, who fell at Flodden, and of Martha, daughter of George, Lord Seaton. He was born in 1496, studied at St. Andrews and in France, and on his return to Scotland was successively employed by James V., the regent Arran, and Mary of Lorraine. About 1551–52, he received the honor of knighthood, became a lord of the court of session in 1561 (before which, however, he had the misfortune to lose his sight), and lord privy seal in 1562. He died Mar. 20, 1586, at the age of 90. Maitland was one of the best men of his

time. In an age of violence, fanaticism, and perfidy, he was honorably conspicuous by his moderation, integrity, and anxiety for the establishment of law and order. He merits consideration not only as an eminent and upright lawyer, but as a poet, a poetical antiquary, and an historian. All his own verses were written after his 60th year, and show what things he had most deeply at heart. For the most part they consist of lamentations for the distracted state of his native country, the feuds of the nobles, the discontents of the common people, complaints "aganis the lang proces in the courts of justice," and the depredations "of the border robbers." A complete edition of Maitland's original poems was first published in 1830 (1 4to vol.) by the Maitland club, a society of literary antiquaries, taking its name from Sir Richard. His collection of early Scottish poetry was a work undertaken, if not completed, before his blindness attacked him. It consists of two MS. vols.; the first containing 176, and the second 96 pieces; they are now preserved in the Pepysian library, Magdalen college, Oxford. Maitland's principal historical performance is the *Historie and Cronicle of the Hous and Surename of Seytoun*, etc.

MAITLAND, WILLIAM, better known as "secretary Lethington," was the eldest son of sir Richard Maitland of Lethington, and was born about 1525. Like his father, he was educated both at St. Andrews and on the continent, and quickly displayed great aptitude for a political career. He became a convert to the reformed doctrines about 1555, but could not have been a very violent partisan, since in 1558 he was appointed secretary of state by Mary of Guise. In the following year, however, he openly joined the lords of the congregation, and was one of the Scotch commissioners who met the duke of Norfolk at Berwick, to arrange the conditions on which queen Elizabeth would give them assistance. In 1561, after the arrival of queen Mary from France, he was made an extraordinary lord of session. He strongly objected to the ratification of Knox's *Book of Discipline*, and in 1563 conducted the prosecution raised against Knox for treason: from this time he appears to have split with the reformers. In 1564 he held a long debate with Knox on the claims of the Reformed church to be independent of the state. In 1566 he took part in the conspiracy against Rizzio, after whose assassination he was proscribed, and obliged to seek shelter for some months in obscurity. He was, it is believed, cognizant of Bothwell's scheme for the murder of Darnley; yet, when he saw the hopeless nature of Bothwell's designs, he immediately joined the confederacy of the lords. While Mary was still a prisoner at Loch Leven, he is said to have written to her, offering his services, yet he was present at the coronation of king James VI., 1567; and although he secretly aided in the escape of the queen, he fought against her on the field of Langside. In 1568 he accompanied the regent Moray to the conferences held at York regarding the Scottish queen; but even here he tried to further her interests, and is said to have been the first to propose to the duke of Norfolk a union between him and Mary. The Scottish lords now felt that he was a dangerous enemy to the commonwealth, and in 1569 he was arrested at Stirling, but was liberated shortly after by an artifice of Kirkaldy of Grange. After the murder of the regent Moray, he and Kirkaldy became the soul of the queen's party, in consequence of which he was declared a rebel, deprived of his offices and lands by the regent Morton, and besieged, along with Kirkaldy, in Edinburgh castle. After a long resistance, the castle surrendered, and Maitland was imprisoned in Leith, where he died, "some," says Melville, "supposing he took a drink and died, as the auld Romans were wont to do." Buchanan has drawn his character with a severe pen in his Scottish tract entitled *The Chameleon*.

MAITLAND, JOHN, DUKE OF LAUDERDALE, grandson of John, first lord Thirlstane, brother of the famous secretary Lethington, and son of John, first earl of Lauderdale, and of Isabel, daughter of Alexander Seaton, earl of Dunfermline and chancellor of Scotland, was b. at the ancient family seat of Lethington, May 24, 1616. He received an excellent education, being skilled, according to bishop Burnet, in Latin, Greek, Hebrew, history, and divinity, was carefully trained in Presbyterian principles, and entered public life as a keen and even a fanatical Covenanter. In 1643 he attended the Westminster assembly of divines as an elder of the church of Scotland, and was a party to the surrender of Charles I. to the English army at Newcastle. Shortly after, however, he changed his politics altogether, and became a decided royalist. When Charles II. came to Scotland from Holland, Lauderdale accompanied him; but being taken prisoner at the battle of Worcester in 1651, was kept a prisoner for nine years. Set at liberty by gen. Monk, in 1660, he hastened to the Hague, and was warmly received by Charles. After the removal of Middleton in 1662, and of Rothes in 1667, Lauderdale was practically the sole ruler of Scotland, and for some time displayed a spirit of moderation, and an apparent regard for the religious feelings of his countrymen; but he soon became a bitter persecutor, sent multitudes of the Covenanters "to glorify God at the Grassmarket," and repelled in blasphemous language the remonstrances which many distinguished persons ventured to make. In 1672 Charles showed his appreciation of Lauderdale's conduct by creating him marquis of March and duke of Lauderdale; two years afterwards he was raised to the English peerage as viscount Petersham and earl of Guilford, and received a seat in the English privy counsel. He was one of the famous "cabal;" but having, by his domineering arrogance, excited the disgust and hatred of his colleagues, as well as of the nation, he fell into disgrace, was stripped of

all his offices and pensions in 1682, and died Aug. 24 of the same year. Lauderdale, according to Burnet, "was in his principles much against popery and arbitrary government," and his infamy consists in his shameless sacrifice of his convictions to his interests. He was a rude, blustering, passionate man, with what the duke of Buckingham called a "blundering understanding." Burnet has also given us a picture of his appearance. "He was very big, his hair red, hanging oddly about him. His tongue was too big for his mouth, which made him bedew all that he talked to; and his whole manner was very unfit for a court."

MAITLAND, SAMUEL ROFFEY, D.D., 1792–1866; b. London; studied at Trinity college, Cambridge, without graduation, as he was not a member of the church of England; studied law, and admitted to the bar at the Inner Temple in 1816; studied theology and was ordained in 1821; held perpetual curacy of Christ church, Gloucester, 1823–29. Resigning this he devoted himself to literature. In 1837 he was appointed librarian to Dr. Howley, archbishop of Canterbury, and keeper of the Lambeth MSS., retaining the office until the death of the archbishop in 1848. He edited for several years the *British Magazine*, in which he wrote valuable articles, chiefly on prophecy, church history, criticism, etc. His principal works are: *An Inquiry into the Grounds on which the Prophetic Period of Daniel and St. John has been supposed to consist of* 1260 *years; Letters on the Voluntary System; The Dark Ages, a Series of Essays intended to illustrate the state of Religion and Literature in the 9th, 10th, 11th, and 12th centuries; Essays on the Reformation in England; Eruvin, or Miscellaneous Essays on Subjects connected with the Nature, History, and Destiny of Man; An Essay on the Mystical Interpretation of Scripture; Strictures on Milner's Church History; Facts and Documents illustrative of the Doctrines and Rites of the ancient Albigenses and Waldenses; Sacred Art; Realism in Modern Art; Superstition and Science; Illustrations and Inquiries relating to Mesmerism.* He wrote also numerous pamphlets, letters, and reviews. He showed "great erudition, great power of reasoning, precision, and perspicuity of statement, and a style of masculine strength, simplicity, wit, and polish."

MAITREYA was, according to the Buddhists, a disciple of the Buddha Sâkyamuni and a Bodhisattwa, or a man of pre-eminent virtue and sanctity. He is classed in their mythology amongst the gods called tushitas, or "the happy," and has generally the epithet *ajita*, or "unconquered." The Buddhists believe that he will become incarnate as their future Buddha. In Thibetan he is called Jampa. A faithful representation of this Buddha, surrounded by the (Thibetan) goddesses Dolma, the Mantas or Buddhas of medicine, two ancient priests, and various saints, will be found in the atlas of Emil Schlagintweit's *Buddhism in Thibet* (London and Leipsic, 1863), where an interesting sketch is given (p. 207, ff.) of the characteristic types of Buddha images, and of the measurements of Buddha statues made by his brothers in India and Thibet.

MAIZE, *Zea*, a genus of grasses, having monœcious flowers; the male flowers forming a loose panicle at the top of the culm; the female flowers in axillary spikes, inclosed in large tough spathes, from which only the extremely long styles—in the common species 6 to 8 in. long—hang out like tufts of feathers or silken tassels. The grains are large, roundish, compressed, naked, and arranged in parallel rows along the upright axis of the spike. The COMMON MAIZE, or INDIAN CORN (*Z. mays*), is generally believed to be a native of the warmer parts of America, where it was cultivated by the aborigines before the discovery of America by Columbus. But a representation of the plant found in an ancient Chinese book in the royal library in Paris, and the alleged discovery of some grains of it in the cellars of ancient houses in Athens, have led some to suppose that it is a native also of the east, and has from a very early period been cultivated there, and even that it is the "corn" of Scripture; although on this supposition it is not easy to account for the subsequent neglect of it until after the discovery of America, since which the spread of its cultivation in the old world has taken place with a rapidity such as might be expected from its great productiveness and other valuable qualities. Columbus himself brought it to Spain about the year 1520. It is now in general cultivation in the s. of Europe, and supplies a principal part of the food of the inhabitants of many countries of Asia and Africa. It is by far the most productive of all the cereals; in the most favorable situations yielding an increase of 800 for one, whilst an increase of 350 or 400 for one is common where irrigation is practiced, and even without this the return is large. Maize succeeds well in tropical and sub-tropical climates; and, being a short-lived annual, is cultivated also where the heat of summer is intense and of sufficient duration, whatever may be the cold of winter. Thus, its cultivation extends to the northern parts of the United States, and is pretty common in Germany; although the want of sufficient summer heat renders it a very uncertain crop even in the southern parts of Britain. Some of the varieties of maize require about five months from the time of sowing for the ripening of their grains; whilst others, which, of course, are preferred in countries having a comparatively short summer, ripen in six weeks, or even less, but they are much less productive. The varieties are very numerous, of taller or humbler growth, from 3 to 10, or even 14 ft; with yellow, white, brownish-red, or purple, glass-like, somewhat translucent grains, which vary very much in size. The culm is stout and erect; the leaves from 1 foot to 2 ft. long, and 2 or 3 in. broad; the ears or *cobs* generally 2 or 3 in number, situ-

ated below the middle of the stem; in the large varieties, often above a foot long, and thicker than a man's wrist, in the smallest varieties, 4 or 5 in. in length. Maize succeeds best in light, rich, deep, and rather moist soils; and dislikes shady situations. It is very generally planted in little hillocks raised at intervals, and to each of which 5 or 6 seeds are allotted. North American settlers generally make it their first crop on newly cleared and very partially tilled ground. The grains of maize make a very palatable kind of groats, and afford an excellent meal for baking purposes. The meal is not, however, adapted for making bread without a mixture of wheat flour, or rye, owing to its deficiency in gluten; although in oily or fatty matter maize is richer than any other grain, and is very nutritious. Maize meal mixed with rye meal forms the common brown bread of New England. Maize very coarsely ground and boiled forms the *hominy* of the southern states of North America. The porridge made of maize meal is called *mush* in North America; and the entire grains are used under the name of *hulled corn* or *samp*. The unripe grains, slightly roasted, burst and turn inside out, assuming a very peculiar appearance; in this state, they are known as *pop-corn*; and in this state are a favorite article of food in America, and have recently become common in shops in Britain. The cobs of maize, ripe or unripe, are gathered with the hand. The unripe cobs are often pickled; they are also often boiled for the table. A kind of beer called called *chica* (q.v.) is made from maize, also a spirituous liquor, and vinegar. The starch of maize is a good substitute for arrow-root, and is now well known in Britain under various names, as *Oswego flour*, etc. The pith of the culm, before the flowers are produced, abounds in a sweet juice, which, extracted and boiled to a syrup, has of late been largely employed in the United States to furnish sugar; it is also fermented and distilled, and yields a good spirituous liquor. The small young stalks of thickly sown crops are cut over by the Mexicans, as an article for the dessert. In countries where maize does not ripen well, it is sometimes sown to afford food for poultry, or to be mown as green fodder for cattle. Where it is cultivated for its grain, the dried leaves are used as winter fodder. The tops, cut off after flowering are stored for the same use. The stalks are used for thatch and for fuel, and for making baskets. The fibers of the culm and leaves afford a durable kind of yarn; and the bracts or spathes which surround the ear are elastic, and can be applied to the stuffing of chairs, saddles, etc., and to the manufacture of good durable mattresses, which have become a profitable article of trade in Paris and Strasburg. The spathes are also much used for packing oranges and lemons; and in South America for making cigarettes. Good paper has been manufactured from them. There are few plants of which the uses are more various than maize, and few which are of greater importance to man. For separation of the grains of maize from the ears, a particular kind of thrashing-machine is used. Another species of maize, called CHILI MAIZE, or VALPARAISO CORN (*Z. curagua*), is distinguished by its serrated leaves. It is a smaller plant, a native of Chili, and has won a superstitious regard, because its grains when roasted split in the form of a cross.

MAJESTY, a title of honor now usually bestowed on sovereigns. Among the Romans *majestas* was used to signify the power and dignity of the people; and the senatorial, consular, or dictatorial majesty was spoken of, in consequence of these functionaries deriving their power from the people. After the overthrow of the republic, *majestas* became exclusively the attribute of the emperors, *dignitas* being thenceforth that of the magistrates. The *majestas* of the emperors of Rome was supposed to descend to those of Germany as their successors; but the adoption of the attribute by other European sovereigns is of comparatively late date. Its use began in England in the latter part of the reign of Henry VIII., up to which time "your grace" or "your highness" had been the appropriate mode of addressing the sovereign. Henry II. was the first king of France who was similarly styled, and Louis XI. and his successors became entitled, in virtue of a papal bull, to call themselves by the title of "most Christian majesty." Ferdinand and Isabella of Spain similarly obtained for themselves and their successors the title of "most Catholic majesty;" and Stephen, duke of Hungary, and Maria Theresa, of "apostolic majesty." The emperor of Austria is now styled his imperial royal majesty; in German, "K.K. (abbreviated for kaiserliche königliche) majestät." Emperors, kings, and queens are now generally addressed as "your majesty," not including the sultan of Turkey, whose proper style is "your highness." The sovereign of the United Kingdom is personally addressed as "your majesty;" and letters are addressed to "the king's" or "queen's" "most excellent majesty."

In heraldry, an eagle crowned and holding a scepter, is blazoned as an "eagle in his majesty."

MAJOLICA, a name at first given by the Italians to a certain kind of earthen-ware, because the first specimens that they saw came from Majorca; but as subsequently a large manufacture of the same kind of earthen-ware was carried on at Faenza, the name majolica was dropped, and "faience" substituted. The term majolica is now used to designate vessels made of colored clay, and coated with a white opaque varnish, so as to resemble "faience;" it is of much less value, and is very common in Italy.

MAJOR, a term in music, applicable to those intervals which are susceptible of being lowered a semitone without becoming false. See INTERVAL. Major is chiefly used as applied to the mode, key, or scale, which is said to be in the major when the third

above the key-note is a major third—that is, when it is distant from the key-note four semitones; thus, C C♯ D D♯ E

1 2 3 4

MAJOR, in the army, is the second field-officer in a battalion of infantry or regiment of cavalry. He ranks next to the lieut.col., and commands in his absence; is mounted; and is responsible, with the adjutant, that the men are properly drilled and equipped. The pay of a major ranges from £1 4s. 5d. a day in the household cavalry, to 16s. a day in the infantry of the line. There are no majors in the royal marines; and it was only in 1872 that, in the royal artillery and royal engineers, the first-captains were converted into majors to put their promotion more on a par with the line. In the artillery, the major commands a battery. Used adjectively, the word *major*, in the army, signifies a superior class in a certain rank, as sergeants-major, who are superior sergeants; except in the case of general officers, in which its signification is arbitrarily limited to maj.gen., the third of the four classes of generals.

MAJOR, GEORG, D.D., 1502–74; b. Nuremberg, Germany; studied theology under Luther and Melanchthon; was successively rector at Magdeburg in 1529; superintendent at Eisleben in 1536; professor of theology and court-preacher at Wittenberg in 1539; represented the Protestants in colloquy at Regensburg in 1546. When the Smalcald war broke out he left Wittenberg, and was appointed superintendent and court-preacher at Merseburg, but at the close of the war, the next year, he returned to Wittenberg. In 1552 he was made superintendent of Mansfeld churches. In 1551 he actively supported the doctrine of the Leipsic interim, that good works were necessary to salvation, in opposition to the strict Lutherans who denied that proposition. Amsdorf assailed him, declaring that good works were or might be detrimental to salvation. He was joined by the clergy of the district, and the count of Mansfeld being of the orthodox party. Major removed to Wittenberg. The doctrines advocated by Major were finally branded as heretical in the *Corpus Doctrinæ Prutenicum*, and were rejected by the compilers of the *Formula Concordiæ*. Towards the close of his life he became involved in the Crypto-Calvinistic controversy (q.v.). A portion of his works, comprising homilies and commentaries on the Gospels and Pauline epistles, was published in 1569 in 3 folio volumes.

MAJOR, RICHARD HENRY, b. in London, 1818; was made keeper of the maps and charts in the printed book department of the British museum, 1844; served as honorary secretary of the Hakluyt society from 1849 to 1858, editing therefore the *Select Letters of Christopher Columbus;* the *Historie of Travaile into Virginia Britannica*, and *Notes upon Russia*, from the Latin of Herberstein, and writing introductions to Mendoza's *History of China* and the earl of Ellesmere's *Tartar Conquerors of China*. At a later period he edited for the same society *India in the Fifteenth Century* and *Early Voyages of Terra Australis*. In 1861 he brought to light documents in the British museum showing the discovery of Australia by a Portuguese navigator in 1661, for which he was knighted by the king of Portugal. In 1868 he published the *Life of Prince Henry of Portugal, Surnamed the Navigator*—a work of great value. In later years he has been honorary secretary of the Royal geographical society and a frequent contributor to its *Journal*.

MAJORANI, GAËTANO. See CAFFARELLI, *ante*.

MAJOR'CA (Spanish, *Mallorca*), the largest of the Balearic isles (q.v.), lies 107 m. s.e. of the mouth of the Ebro, the nearest point of the Spanish coast, and 171 m. n. of Algiers. Its greatest length (from e. to w.) is 64 m., and its breadth (from n. to s.) 48 m., with an area of about 1386 English sq.miles. The n.e. half of the island is mountainous; the other parts are finely diversified with hills, valleys, and plains. The climate is healthful, the sea-breeze preserving a nearly equable temperature over the whole island. The inhabitants, who much resemble the Catalans in their appearance and manners, number above 200,000, are hospitable and industrious, and mostly employ themselves in agriculture. The chief products of the island are marble, slate, plaster, the common cereals and legumes, oranges, silk, lemons, oil, wine of excellent quality, olives and aromatic herbs. The chief town is Palma (q.v.), the capital. The Spanish government makes use of Majorca as a place of banishment for political offenders.

MAJORITY is the age at which a person in this country acquires a status of a person *sui juris*—i.e., is able to manage his or her own affairs. This age, in the United Kingdom is 21. Under that age, persons in England and Ireland are called infants, and are more or less subject to guardians, who manage for them their property. In Scotland, young persons are called minors between 12 (if females) or 14 (if males) and 21. It is chiefly with respect to the management of property that the distinction of majority is fixed upon, as it is assumed that persons under that age have not discretion and firmness to enter single-handed into contracts. It is also a common period fixed upon in wills at which to make provisions payable. As far as liability for crime is concerned, majority makes no difference, for all persons are capable of crime, when they have discretion enough to know that particular acts are criminal. A minor can, in Scotland, make a a will of movable estate, but cannot do so in England.

MAKÂLLAH, a seaport on the s. coast of Arabia, 300 m. e.n.e. of the port of Aden. It has a well-protected harbor, and is much frequented by vessels for the purpose of

laying in stores. It exports gum, hides, and senna, and is an extensive slave-market. Pop. about 4,500.

MAKART, HANS, b. Salzburg, 1840; studied art in Munich, following the school of Piloty; first became noted as an historical painter about 1868. He is a member of the Munich academy, and a professor of art in Vienna, where he has established his studio. His first great work was his "Catharine Cornaro," which was exhibited in the Austrian collection in Memorial hall, during the Centennial exhibition. It was sold for $12,500, and is now in the possession of the Berlin national gallery. His next most important work was the "Entrance of the Young Emperor Charles V. into Antwerp," which was exhibited in 1878, and attracted general attention. He also painted "The Gifts of Sea and Earth," two paintings of still-life, which were in the Centennial exhibition. Makart's work is characterized by a mastery in the use of color, warmth in the combinations effected, and startling contrasts; strongly reminding one of the Venetian school of Giorgione and Tintoretto. The *Portfolio* concluded some severely critical remarks on his "Catharine Cornaro" as follows: "There are few painters of the present day who have enough daring to handle such vast material, to dispose fearlessly and with proper relation so large a number of figures; and there are still fewer who possess the skill in execution which renders Herr Makart's picture a surprising and, in some sense, admirable performance." Another critic, writing for the same publication, says: "Herr Makart, by birth Austrian, but trained under Piloty, is imbued with the romance and voluptuousness of Venezia. He is, in fact, the Veronese of Vienna."

MAKI. See LEMUR, *ante*.

MAKIAN', one of the Moluccas (q.v.).

MAKO', a market-town of Hungary, on the right bank of the Maros, 16 m. e.s.e. of Szegedin. Pop. '70, 27,449, many of whom are Jews. The town contains numerous mills, and is famous for its breed of oxen, which are of unusually large size.

MAKRIZI, TAKI ADDIN ABU AHMAD MOHAMMAD, an eminent Arabic historian and geographer, was b. in 1360 A.D., in Makriz, near Baalbec. He early devoted himself to the study of history, jurisprudence, tradition, astrology, etc., at Cairo, where also he afterwards held the offices of mohtasib, or inspector of weights and measures, and of khatib and imam at different mosques. The most important of his numerous works are a *Topographical History of Egypt*, a *History of the Mamluk Sultans*, and two treatises on Moslem (Kufic) coins, weights, and measures, which have been edited and translated by Tychsen (into Latin), and by Silvestre de Sacy (into French). Makrizi also commenced a work *On the important Personages who had visited Egypt*, intended to fill 80 vols.; but only a small portion of these (one autograph volume is in the imperial library at Paris) was really accomplished. He died at the age of 82 years, in 1442 A.D.

MALABAR', a maratime district of British India, in the presidency of Madras, is bounded on the e. by the district of Coimbatore, while on the w. its shores are washed by the Arabian sea; and it extends in lat. from 10° 15′ to 12° 18′ north. Area, 6,002 sq.m.; pop. (July, '71) 2,261,250. The surface is occupied in the e. by the Neilgherries, and the western Ghauts cover a great portion of the district. The name of this district is applied to the whole south-western coast of southern India.

MALABAR (*ante*), a country lying on the western coast of India, and extending from cape Comorin to the river Chandragiri in 12° 30′ n. lat. The British province of Malabar is a portion of this tract between 10° and 13° n. lat., bounded n. by the province of Canara; s. by the territories of the rajah of Cochin; w. by the ocean, and e. by the chain of the western Ghauts. Between these and the sea Malabar lies, extending 200 m. along the coast, with an average breadth of 40 miles. The country may be divided into two parts, the first of which lies on the sea-coast about 3 m. wide, and consists of a poor sandy soil, covered with cocoanut trees. Near the termination of the low hills, which are offsets of the Ghauts, the soil is better, and is planted with rice. The sandy coast is remarkably intersected by inlets of the sea, which often run for great lengths parallel to the coast, receiving the various mountain streams, and communicating with the ocean by different narrow shallow openings. In other places the fresh water descending from the mountains into the low lands within the downs upon the sea-coast in the rainy season, totally overflows them as they have no outlet, and when the water is evaporated, these lands are cultivated and yield rich crops of rice. The second and most extensive portion of Malabar is in the vicinity of the Ghauts, and consists of low hills with narrow valleys between, which are rendered very fertile by the fine particles of mold washed down from the hills. The hills are low, their summits are level, dry and bare, presenting large surfaces of naked rock, with remarkably steep sides. These sides having the best soil are formed into terraces, and highly cultivated. The uplands are barren, and not much cultivated, and the inhabitants reside chiefly in the valleys and extensive ravines, upon the banks of the rivers and inlets. There are no large rivers, but innumerable small streams water the country. The climate though hot is generally healthful. The thermometer generally rises to about 90° in the shade, and seldom falls below 70°. The hot season is from February to May, and the wet from May to October. The low

country of Malabar and the whole region under the western Ghauts are excessively hot in February, and the vapors and exhalations are so thick that objects can with difficulty be distinguished at a distance of 5 miles. At the commencement of the western monsoon the rains fall very heavily both in the low country and on the mountains. These rains wash away the soil, leaving nothing but loose stones and sand on the hills. Forest trees abound, sometimes intermixed with corn-fields and plantations of fruit trees. The teak is produced in great abundance. Sandal wood not produced in Malabar, grows e. of the western Ghauts, and is exported from the ports of Malabar. Cocoanut trees abound. Black pepper is grown extensively, and is the chief export by Europeans who purchase about five-eighths of what is raised, and send it either directly to Europe, or to Bombay and China. The remainder is exported by native traders to the bay of Bengal, Surat, Scinde, and other places in n.w. India, and a portion is sent to the Arabian ports of Muscat, Mocha, and the British port of Aden. Ginger, betel-nuts, cardamoms, turmeric, and arrow-root are grown. Cardamoms grow on the face of the mountains in forest-lands. Within a few years the English have cultivated coffee on plantations situated on the slopes of mountains 2,000 ft. above sea-level. They obtain land either of the government or of natives, and not much capital being required, and the wages of native laborers being small, the profits are large. Rice is raised, but not enough for home consumption. Ginger is largely cultivated and exported to Europe. The animals are the elephant and bison in the forests, and some tigers, leopards, deer, bears, hogs, porcupines, monkeys, and squirrels. There is an animal of the ox species, called the *gayal*, found in the recesses of the mountains, 10 ft. high, with beautiful horns. There are but few horses. There is a small bullock used for tilling the ground and drawing vehicles, but not much in the transportation of goods, that being done by porters. Poultry has been introduced by Europeans, and common fowl now are abundant. Slavery existed in Malabar until a legislative act was passed in 1843 abolishing it throughout the British possessions. Malabar being intersected by many rivers, and inclosed by high mountains has been less disturbed than other parts of India by Mohammedan invasion, until in 1763 it was invaded and conquered by Hyder Ali. On this account the manners and customs of the Hindus here have been less changed than in other parts of India. The population consists of Hindus, Mohammedans, Christians, and some Jews. The Hindus constitute the great proportion. They are divided into the following castes: The Brahmins called Namburies are the highest, and another more numerous class of Brahmins called Puttars. The Nairs are the next, and then the Teers or Tiars who cultivate the land, and are freemen. Lastly the Patiars or Poliars, who were formerly slaves. The most remarkable caste is the Nairs who claim to be born soldiers, though they are of various ranks and professions. They are of 11 ranks, and form the militia of Malabar under the Brahmins and rajahs. They are very arrogant and formerly a Nair did not hesitate to strike down a cultivator or a fisherman who defiled him by touching his person, or a Patiar who did not turn aside when meeting him. The ancient Hindu state of property prevailing in Malabar, most of the land cultivated or uncultivated belongs to individuals, who have an absolute control of it.

The Brahmans, Nairs, and Tiars are well proportioned, handsome, and of olive complexion. The Mohammedans, called Moplays, are about one-fourth of the population, and are descendants of Hindu mothers and Arab fathers who settled in Malabar in the 7th or 8th century. The aboriginal natives generally live in separate houses, surrounded with gardens; but the villages are the work of foreigners, the houses being built of mud, neatly smoothed, and whitewashed or painted. The chief towns are Calicut, Tellichery, Cananore, and Ponany. Beypoor, 7 m. s. of Calicut, where Gama landed in 1498, is connected by a railway with Madras. The Portuguese then settled in Malabar, and the Dutch in 1663. The original name for Malabar in Sanskrit was Kevala. It is supposed that Malabar was very early conquered by a king from beyond the Ghauts, and that the Nairs were established there by the conqueror or brought in by the Brahmans as a military body to support the government; that in time they obtained settlements, and the chiefs became rajahs who governed the country like independent princes, until the invasion of Hyder Ali in 1763. He conquered and plundered the country, and expelled all the rajahs except those who submitted to him. In 1782 he appointed a deputy who made further progress in subduing and settling the country. In 1788 his son Tippoo proposed to the Hindus to accept the faith of the prophet, and began to levy large contributions on them, compelling many Brahmans, Nairs, and others to be circumcised. This produced a rebellion which his vigor soon suppressed. When the war broke out between Tippoo and the English in 1790, the rebellious rajahs and Nairs, who had fled from his persecution to the jungles, joined the British army, and Tippoo was driven from the country. In 1803 Malabar was incorporated in the Madras presidency. Christianity early made considerable progress in this part of India. The Nestorians established churches there in the 5th or 6th century. When the Portuguese landed in 1500 they found not only a Christian king, but a large body of professing Christians, and upwards of 100 churches. Buchanan at his visit in 1807 found 44 churches. The Romanists from Goa established themselves here in the beginning of the 16th century. The whole number of Christians on the Malabar coast, including the Nestorians or Syrians at the present time, is computed at 200,000. There are also about 30,000 Jews. The population in 1850 was 1,514,909. The country is tranquil and prosperous.

MALAB'ATHRUM, a name given by the ancient Greeks and Romans to aromatic leaves, which were in high repute among them, both as a medicine and a perfume, and with which they sometimes flavored wine. These leaves were brought from India, whence they were often called *Indian leaves;* and from the value in which they were held, sometimes simply *leaves*, just as the term bark is now used to designate the medicinal bark of the cinchonas. Many fabulous accounts were current of their origin. They are now pretty certainly known to be the same with the leaves sold in every Indian bazaar under the name of *tej-pat*, the produce of two nearly allied species of cinnamon (*cinnamomum tamala* and *c. albiflorum*), growing in the dense forests of the Himalayan valleys; and the name Malabathrum is regarded as a corruption of *tamalaputra*, tamala leaf. They are aromatic, fragrant, and gently stimulant.

MALAC'CA, a British maritime settlement on the s.w. coast of the Malay peninsula, extends in lat. from 2° to 3° n., and long. from 102° to 103° east. It is 40 m. in length, and, including the district of Naning, about 25 m. broad. Area, about 1000 sq.m.; pop. '71, 77,755. Near the coast, which is washed by the strait of Malacca, the surface is flat and swampy, producing rice. Inland, there are low hills, Mt. Ophir rising to 3,920 feet. Although little agriculture is carried on, and the greater portion of the country is still in the condition of jungle, the soil is fertile in rice, sago, pepper, fruits, vegetables, rattans, and timber. In the district of Naning are tin mines of some value. The climate is remarkably salubrious; the land and sea breezes are regular; and the thermometer ranges from 72° to 85°. The town and seaport of Malacca, capital of the district of the same name, is situated in lat. 20° 11′ n., long. 102° 16′ e., at the mouth of a small river which flows into the strait of Malacca. It is handsome and well built, and presents a fine appearance from the sea. Its most interesting building is the church of our Lady del Monte, the scene of the labors and supposed miracles of St. Francis Xavier, "the apostle of the east." Pop. variously estimated at from 5,000 to 15,000.

Malacca was taken by the Portuguese under Albuquerque in 1509; became a Dutch possession in 1642; fell in 1795 into the hands of the British to whom it was finally ceded in 1824. In 1867 Malacca, together with Singapore and the Prince of Wales island, were transferred from the control of the Indian government to that of the colonial secretary.

MALACCA, STRAIT OF, separates the Malay peninsula on the n.e. from the island of Sumatra on the s.w. Length, 520 m.; breadth varying from 25 m. at the s.e. to 200 m. at the n.w. extremity. In this strait are the British settlements of Singapore, Malacca, and Penang.

MAL'ACHI (probably an abbreviated form of *malachyah*, meaning "messenger of Jehovah;" the Seventy and the Vulgate have *malachias*), the name given to the last canonical book of the Old Testament. Regarding its author, nothing whatever is known. It has even been doubted whether Malachi is a proper name or only an appellative; the Seventy, the Chaldee, Jerome, and many modern scholars—Vitringa, Hengstenberg, Umbreit, etc.—favor the latter view. The period when the writer of Malachi composed his prophecies is conjectured to have been during the governorship of Nehemiah, or about 420 B.C. The book exhibits that strict regard for the proper observance of the ceremonial law, and that hatred of foreign marriages, etc., which marked the religious Jews after the return from exile, but has little of the old prophetic fire, freedom, and dramatic force

MALACHI, PROPHECY OF (*ante*), has a place in the canon of Scripture which has never been disputed and is explicitly confirmed by at least six quotations in the New Testament. I. As to the time when it was written. That Malachi was contemporary with the latter part of Nehemiah's administration is argued from the similar state of things mentioned in the prophecy and the history. 1. Malachi speaks of the governor of the Jews by the same name as that given to Nehemiah by the Persian king. 2. Malachi reproves the priests for having neglected, despised, and profaned the worship of God; and Nehemiah relates that, on his return a second time from Persia to Jerusalem, he found that a grandson of the high-priest had married a daughter of Sanballat, the notorious adversary of the Jews' religion; that the high-priest had established Tobiah the Ammonite in the precincts of the temple; that the priests and the Levites were defiled, their sacred covenant despised, and the Sabbath profaned. 3. Malachi charges the whole nation of the Jews with having robbed God by withholding the tithes and other appointed offerings; and Nehemiah relates that during his absence the portions of the Levites had not been given them, and that consequently they and the singers appointed to conduct the services had gone home to their fields. 4. Malachi denounces judgments on the nation for dealing treacherously with the wives of their youth and marrying strange wives; and Nehemiah relates that the Jews had married wives of Ashdod, of Ammon, and of Moab, and that their children spake half in the speech of Ashdod, having lost the knowledge of their fathers' language. II. These indications of the time when the prophecy was written explain also its contents, which are: 1. A declaration of God's love to Israel as proved by their history; 2. An address to the priests rebuking them for their heartless, mercenary, and corrupt services, threatening them with judgments if they persisted in their sins, and describing the character of a true priest in bright contrast with their own; 3. A rebuke of the people for their mar-

riages with the heathen and their rejection of the lawful wives of their youth, who were left to weep at the altars of God, the institutor of marriage at the beginning as a perpetual covenant; 4. An announcement of the sudden coming of the Lord, whom they claimed to seek, but who in an unexpected coming would sit in judgment against all transgressors, supplying by his own omniscience swift testimony against them; 5. A call to repentance, with the promise of abundant blessings to all who obey; 6. A testimony that there were some who feared God, and an assurance to them that they would always be precious in his sight; 7. A renewed announcement both of the appointed judgment and of the promised Savior, before whose great and dreadful day one in the spirit and power of Elijah the prophet would come calling fathers and children to repentance as the only way of avoiding the hastening doom.

MALACHITE, a mineral, essentially a carbonate of copper, of a green color, often found as an incrustation or stalactitic along with other ores of copper; often in large masses, and often also crystallized in rather oblique four-sided prisms, beveled on the extremities, or with the beveling planes truncated so as to form six-sided prisms. It is often of a fibrous structure. It is valuable as an ore of copper, although seldom smelted alone, not only because it is found along with other ores, but because the metal is apt to be carried off with the carbonic acid. It is sometimes passed off in jewelry as turquois, although easily distinguished by its color and much inferior hardness. It is used for many ornamental purposes; slabs of it—chiefly from the mines of Siberia—are made into tables, mantel-pieces, etc., of exquisite beauty. In 1835 a mass of solid malachite was found in the Ural mountains of more than 17 ft. in length, and weighing about 25 tons.

MALACHY, IMAR, Archbishop of Armagh, in Ireland, and a saint of the Roman Catholic church, is remarkable not only for his connection with a very important period of Irish church history, but also from the circumstance of his biography having been written by his distinguished contemporary, St. Bernard. Malachy was born, in the end of the 11th c., of a noble family, and having been educated by a hermit, named Imar, received orders at an early age from the hands of Celsus, archbishop of Armagh. His reputation for learning and sanctity was unexampled in that age, and Celsus had early designed Malachy as his successor in the see of Armagh; but Malachy protested against it, in consequence of an abuse similar to that of lay impropriation (q.v.), by which the temporalities of the see were held by laymen, called *coarbs.* In the end, however, he was elected, with the full rights of his see, and soon afterwards, in his capacity of primate, took measures for the reform of the many abuses which prevailed in all the churches of Ireland. He went to Rome during the pontificate of Innocent II., and having in vain sought permission to resign his see, and retire to Clairvaux, returned to Ireland invested with extraordinary powers as legate of the pope. In this capacity, he made a visitation of Ireland, and many of the controversies as to the ancient religious usages of the Irish church, which would be out of place in this publication, turn upon this period. Malachy again repaired to France in 1147, in order to meet the pope, Eugene III., during his visit to that country; but before his arrival, the pope had returned to Rome, and Malachy, during a visit to his friend, St. Bernard, at Clairvaux, was seized with an illness which ended in his death in the year 1148. A curious "prophecy concerning the future Roman pontiffs," is extant under the name of Malachy. It designates, by a few brief phrases, the leading characteristics of each successive reign, and in some instances these descriptive characteristics have proved so curiously appropriate as to lead to some discussion. The characteristic of Pio Nono, *Crux de Cruce* (cross after cross), was the subject of much speculation. That the prophecy really dates from the time of Malachy, no scholar now supposes; it was unknown not only to St. Bernard, but to all others, until the 16th century. It is first noticed in the end of that century, but it may be a sufficient indication of its worth to state that neither Baronius nor any of his continuators deemed it deserving of attention.

MALACOL'OGY (Gr. *malakos,* soft), a name now not unfrequently employed to designate that branch of natural history which has *mollusks* (called *malakia* by Aristotle) for its subject. Linnæus, and the naturalists who preceded him, devoted some attention to this study; but until the time of Cuvier the shells of the shell-bearing mollusks received a disproportionate share of attention, and the animals themselves were little regarded. Conchology (q.v.) has now, however, sunk to a very subordinate place, as a mere part of malacology, and this branch of science has been prosecuted during the present century by many eminent naturalists with great zeal and success. The names of Oken, Savigny, De Blainville, Van Beneden, Milne-Edwards, and Owen perhaps deserve to be particularly mentioned.

MALACOPTERY'GII, MALACOP'TERI (Gr. *malakos,* soft; and *pteryx,* a wing), or MALACOPTEROUS FISHES, one of the two primary divisions of osseous fishes in the system of Cuvier, distinguished by soft or spineless fins, the rays of which are jointed. Spiny rays are occasionally found in the first dorsal and the pectoral fins. Cuvier subdivided the malacopterygii into orders according to the position or absence of the ventral fins; *malacopterygii abdominales* having the ventral fins beneath the belly, as the salmon and herring; *malacoptery'gii sub-brachiati* having the ventral fins beneath the shoulder, as the cod and haddock; and *malacoptery'gii apodes* wanting ventral fins, as eels. Müller, however—followed in this by Owen and others—has separated from the malacopterygii an order of

fishes to which he has given the name of ANACANTHS (*anacanthini;* Gr. spineless), differing from acanthopterous fishes merely in the absence of spinous rays in the fins. Among the anacanths are the important families *gadidæ* (cod, etc.) and *pleuronectidæ* (flat-fish).

MALACOSTRACA (Gr. *malakos* soft, *ostraken,* shell), Aristotle's name for crustaceans. The malacostraca are now classified as a sub-class of crustacea, which comprises two divisions, *edriophthalmata,* and *podophthalmata.* In the first division the eyes are sessile, and the body not generally protected by a carapace. It comprises two orders, amphiopoda and isopoda. The eyes are generally compound, but are sometimes simple, and placed on the sides of the head, which is nearly always distinct from the body. The typical number of feet is seven pairs. The amphiopoda include the whale-louse (q.v.) and the sand-hopper (q.v.). A section of this order, *læmidopoda,* has been regarded as a distinct order, but the pretension has been withdrawn. In isopoda the respiratory organs are not thoracic as they are in amphiopoda, but are attached to the inferior surface of the abdomen. There are two eyes formed of a collection of simple eyes, or are sometimes really compound. The young isopod is developed within a larval membrane without appendages, which after a time bursts and sets free the young, which resemble the adult in most respects, but have only six pairs of limbs instead of seven. Like the amphiopoda, some are aquatic, and some terrestrial. Milne-Edwards divides the isopoda into three sections, 1, *natatory,* 2, *sedentary,* and 3, *cursorial.* In the first section some of the animals are parasitic, and some are not. In the second section they are all parasitic, generally within the gill chambers or upon the ventral surfaces of decapod crustaceans, as shrimps and others. The third section, the cursorial, includes the wood-louse (q.v.) and limnoria (q.v.). The second division of malacostraca, *podophthalmata,* have compound eyes, supported upon movable stalks, and a body completely protected by a carapace. There are two orders, stomapoda (q.v.) and decapoda (q.v.). see also INVERTEBRATE ANIMALS, LOBSTER, CRAB, and SHRIMP.

MALAGA, a modern maritime province of Spain, formed out of the ancient kingdom of Granada (q.v.), is bounded on the s. by the Mediterranean, on the e. by the province of Granada, and on the w. by that of Cadiz. Area, 2,786 sq.m.; pop. '70, 505,010.

MALAGA, a city and sea-port of Spain, capital of the modern province of the same name, is situated on the shore of the Mediterranean, 70 miles n.e. of Gibraltar. Sheltered on the n. and e. by mountains, and with a climate of which dryness and constant sunshine are the characteristics, this place is superior as a resort for invalids to any other either of France or Italy. Winter, in the English sense, is here almost unknown. Malaga is purely a place of commerce, and with the exception of some fine Moorish remains, it contains little that can be called artistic. The sea is here receding, and the Moorish dock-yard and quay are now in the town, while the beautiful *Alameda,* or public walk, was covered with water last century. Malaga is famous for its sweet Muscatel wines, grown on the heights in the vicinity, and the richest of which are called *las lagrimas.* The whole produce of the Malaga vineyards is estimated at from 35,000 to 40,000 pipes, of which about 27,000 pipes may be exported. The exports consist chiefly of wines, oil, figs, almonds, grapes, sugar, and raisins; and the imports of salt fish, iron manufactures, and colonial produce. Sugar is extensively manufactured for export, the production in 1872 being 21,960,000 pounds. Besides its legitimate trade and its manufactures of cloth, ropes, leather, soap, etc., Malaga carries on an extensive smuggling traffic with Gibraltar and Marseilles. Pop 110,000. Malaga, known to the Romans as *Malacca,* is a very ancient place. It was founded by the Phenicians, and has enjoyed a commercial existence and a measure of prosperity for 3,000 years.

MALAGUETTA PEPPER. See GRAINS OF PARADISE.

MALAKANS, a religious sect in the Russo-Greek church. The name in Russian is Molocani, i.e., milk-eaters, who contrary to the rule of the eastern church take milk on fast-days. The term Malakan is a term of reproach. They prefer to be called *Gospelmen.* A Prussian prisoner of war settled about the middle of the last century in a village of southern Russia, and spent his time visiting from house to house, and explaining the scriptures to the people. After his death they acknowledged him as the founder of their new belief. The Malakans receive the Bible as the word of God. They believe in the doctrine of the Trinity, the fall of Adam, the resurrection of Christ, receive the ten commandments, and forbid idolatry and the worship of saints. They consider the taking of an oath sinful, and enjoin a strict observance of the Lord's day. They firmly believe in the millennium. A member of their body, Terenti Beloreff, a fanatic, announced in 1833 that Christ would come in two and a half years. Many Malakans abandoned their callings, and awaited the event with fasting and prayer. Beloreff believed that he himself, like Elijah, would ascend to heaven on a certain day in a chariot of fire. Thousands of Malakans came from all parts of Russia to witness the miracle. He appeared seated in a chariot, ordered the multitude to prostrate themselves, and then, extending his arms as an eagle does its wings, he sprung into the air, fell on the heads of the gazing crowds, was seized and dragged to prison as an impostor. He died soon after, insanely declaring himself the prophet of God. But many of the Malakans still believe in his divine mission. Many of his followers afterwards emigrated to Georgia, in western Asia, and settled in sight of mount Ararat, expecting the millennium.

This sect spend whole days and nights in prayer, and have all things in common. They deny the sanctity and necessity of fasts, especially for men who have to work. They oppose popes and monks. Under the late emperor Nicholas they were severely persecuted, 16,000 men and women being seized by the police, arranged in gangs, and driven with rods and thongs across the steppes and mountains into the Caucasus. A great many fled across the Pruth into Turkey, where the sultan gave them a village called Tulcha for their residence. Dixon in his *Free Russia* has described this sect.

MALAKHOFF, or MALAKOFF. See SEBASTOPOL, *ante*.

MALAMOCCO. See VENICE, *ante*.

MALAN', CÉSAR HENRI ABRAHAM, D.D., 1787–1864; b. Switzerland; educated at the Geneva academy, and ordained to the ministry in 1810. He was at once appointed preacher to the cathedral, and a regent of the academy. The Calvinistic faith in Geneva had for some years been growing more and more rationalistic, and the presbytery of Geneva had issued an edition of the New Testament in which all passages in relation to the divinity of Christ were so changed as to bear a Socinian interpretation. Malan denounced the alterations, and took high evangelical ground; and the differences between him and the ecclesiastical authorities were so great that he left the established church in 1818. For a time he preached at his own house, but after 1820 he preached in an independent church of his own called La Chapelle du Temoignage. He was also active in many other directions. He founded a theological school at Geneva, and introduced Sunday schools into Switzerland. His followers were nicknamed MÔMIERS, which see. Malan published, among other books, *Les Môniers Sont-ils Invisibles*, 1828; *Les Chants de Sion*, 1826; *Le Témoignage de Dieu*, 1833; and *L'Eglise Romaine*, published in English at New York in 1844. He was a man whose zeal for truth, fervor of spirit, and active beneficence have left a lasting impress on his own land and through central Europe.

MALAN', SOLOMON CÆSAR, D.D., b. England, 1812; a son of Dr. César. He was educated at Oxford, and in 1838 went to Calcutta as professor of the classics in Bishop's college. While in India he was ordained deacon, and acted as secretary of the Asiatic society of Bengal. Soon after his return to England he was ordained priest, and made vicar of Broadwindsor in 1845, where he remained till 1871, when he became prebendary of Sarum. He has published many books, of which we may mention: *A Plain Exposition of the Apostles' Creed*, 1847; *A Systematic List of British Birds*, 1848; *Who is God in China?* 1855; *The Gospel According to St. John*, translated from the eleven oldest versions, 1862; *A Plea for the Authorized Version*, 1869; *The Liturgy of the Orthodox Armenian Church*, 1870; and *Original Documents of the Coptic Church*.

MALAPTERURUS (Gr. *malakos*, soft; *pteron*, a fin; and *oura*, the tail) is the name given to a genus of fishes of the family *siluridæ* (q.v.), in which in place of a true dorsal fin there is a soft fatty fin near the tail, and to this peculiarity the name is due. Two species are known, viz., *M. electricus* and *M. beninensis*. See ELECTRICITY, ANIMAL.

MÄLAREN, or MÄLAR, a large and beautiful lake of Sweden. It stretches westward from the Baltic, and lies between the laens of Westevas, Upsala, Nycöping, and Stockholm. A peculiarity of this lake is that it consists of several small lakes connected by short channels, which inclose islands to the number of 1300. Although its length is 78 m., and the average breadth 12, hardly a clear sheet of water a mile square through the whole extent can be found. It sends out many branches to the n. and s., which extend a good distance inland. One of them extending northward is 25 m. long. All of these arms and branches are navigable for boats. It is nearly on a level with the Baltic, and numerous steamers ply to and from Stockholm, which is at the eastern extremity, on both sides of the lake. The advantages of the navigation on lake Mälar have been increased by the Södertelge and Strömsholms canals. The former is 2 m. long, and opens a communication with the Baltic; the latter extends from the western end of the lake 50 m. into the interior, and leads to the region of the mines in the lake of Barken, which is 327 ft. above the sea-level. The scenery of the banks is exceedingly beautiful, and there are many villas and country-seats belonging to the residents of Stockholm.

MALARIA (MIASMA, *ante*), bad air. There are varieties of malaria, the most common or the longest known, or written about, being miasmatic malaria, or marsh miasm, which is regarded as producing the various forms of intermittent and remittent fevers, and, as many believe, yellow fever (see the articles under these titles). Since the more systematic and microscopical investigation of various diseases, it has been shown that many other diseases, some of which are contagious, are produced by poisoned, infected, or bad air—in other words, by malaria. Air impregnated or polluted by sewer gas is the malaria productive of putrid sore throat or putrid fever (diphtheria) (q.v.), and perhaps the origin of scarlet fever. A form of fever called typho-malarial appears to be caused by a mixture of putrid malaria and marsh miasm, although most authorities do not regard it as a distinct disease, but a mixture. It is thought by some that the term malaria should be restricted to marsh miasm, saying that air which is infected with the seeds of any disease, as, for instance, small-pox, might be called malaria, as well as that which produces diphtheria or putrid fever; but it is fairly conservative and proper to regard as malaria all air which is infected by the products of organic decomposition and

putrefaction, whether vegetable or animal, and which in their origin may be so traced, although after being generated they may be contagious.

MALATESTA, the name of an Italian family settled in the Romagna. The family is said to have been founded by a count Carpegna de' Billi, whose violence got him the name of *mala testa*, i. e. "bad head." Their principal branch was the ruling family of Rimini, of which Malatesta, count of Verrucchio, had possessed himself in 1295. He was an active Guelph partisan, as was his son and successor Malestino, who annexed Cesena in 1314. One of his brothers, Giovanni, was the husband of that Francesca, daughter of Guido da Polenta, and mistress of Giovanni's brother Paolo, whose pathetic story is found in Dante's *Inferno*. Malatestino's brother Pandolfo I. succeeded him, and continued the traditional policy of his family, in supporting the pope against the Ghibellines. Malatestino's son Ferrantino succeeded Pandolfo in 1326, but was driven out of Rimini by the pope in 1335; and Pandolfo's sons Malatesta and Galeotto were made joint lords of Rimini. They largely increased the power of the family, bringing under their rule part of Cervia, Fano, part of Fermo, Fossombrone, and Pesaro. Malatesta died in 1364, but Galeotto reigned till 1385, and was succeeded by his sons, Carlo and Pandolfo III. Carlo was a zealous supporter of pope Gregory XII., during the great schism, an opponent of the emperor Sigismund, and one of the ablest commanders of his time. Both he and Pandolfo III. held commands in the armies of the Visconti, dukes of Milan; and next to the Visconti the Malatesta family was at that time the most powerful in Italy. It was connected by marriage with the houses of Urbino and Montifeltro, and it had possession at one time of Bergamo and Brescia. Pandolfo III. died in 1421, and Carlo in 1427, without issue. Perhaps the most celebrated of the Malatesti is Sigismondo Pandolfo, who died in 1468. He was a patron of artists and authors, the founder of a library at Rimini, and a skillful general who fought for himself, for Venice, Naples, Sienna, Florence, and Aragon, and who made war upon the pope and was excommunicated in 1460. He was a son-in-law of Francesco Sforza. The last Maletesta who was lord of Rimini, was Pandolfo IV., driven out by Clement VII. in 1526, when Rimini was added to the dominions of the pope, of whom it had originally been held as a fief. The family was of German origin, and a member of it is mentioned in the early chronicles as being imperial vicar of Rimini under Otho III.

MALAY APPLE. See EUGENIA.

MALAY, INDIAN, or EASTERN ARCHIPELAGO, the largest and most important system of island groups in the world, stretching from 95° to 140° e. long., and 19° n. to 11° s. lat., is bounded n. by the China sea, e. by the Pacific, s. and w. by Australia and the Indian ocean. The principal groups are the Sunda islands, including Sumatra, Java, Bali, Sumbawa, Flores, the Sandalwood island, Rotti, Timor, etc.; the Philippines, in the n.; Celebes and the Saleyer islands, n. of Flores; the Moluccas, Key, Arru, Timor-Laut, and other groups, e. of Celebes. The chief islands for trade are Java, Sumatra, the Moluccas, and Borneo. The western or Dutch division of Papua, or New Guinea, is reckoned a part of the Malay Archipelago. The Philippines belong to Spain; Great Britain possesses Singapore, Penang, Malacca, and Labuan. Native rajahs rule over several of the islands, but the Dutch East Indies include the largest portion. The heat is tempered by sea-breezes, and water is abundant. Sugar, coffee, indigo, rice, and tea are largely produced in Java and Sumatra. Benzoin, gum-elastic, resin, pepper, rattans, cotton, drugs, ivory, dye-stuffs, edible nests, wax, tobacco, opium, and bêche-de-mer are also exported. Fine timber trees, including iron-wood, ebony, etc., are abundant, and the vegetation is most luxuriant. Birds of paradise, and a fine species of parrot, are found in Papua, the Arru, and Key islands.

MALAY PENINSULA, or Malacca. The name Malacca having by erroneous usage come to be applied to the British settlement on the s.w. portion of the peninsula rather than to the peninsula entire as it should be, we will describe it under the head by which it is also known, as the Malay peninsula. It is the most southerly part of the continent of Asia, extending from lat. 1° to 12° n., and between long. 98° and 104° e. of Greenwich. It is 775 m. in length n. and s., with an average width of about 100 m., and an area of 75,000 sq. miles. The gulf of Siam and the China sea wash its eastern shore, and the straits of Malacca and the Indian ocean its western.

A range of granite mountains extends northerly the whole length of the peninsula; its highest summits being in the southerly part, between lat. 6° and 7° n., which are 6,000 ft. above the sea. Innumerable rivers flow e. and w. from the mountains, forming bars at their mouths that render them of little value for navigation or harbors. The country between the mountains and the sea has considerable table-land, of fair fertility, and well timbered. But the timber is not of species possessing greatest commercial value. Ebony, sapan, eagle-wood, and the canes of commerce known as Malacca, are the principal. Dense jungles, the broken character of the surface, and occasional swamps, make the country difficult to explore. The Perak on the w., and Pahang, are the largest rivers. There is a small lake between the latter and the English settlement of Malacca. The products of the forests, besides those timbers already named, are caoutchouc, gutta-percha, cocoa-nuts, gums, spices, and resins. The products of the soil are rice, tobacco,

sugar-cane, coffee, cotton, bananas, yams, pine-apples, durians, and the mangosteen—the two latter large fruits. Tin mines have been worked in the mountains, but the mining is not prosecuted with increasing production; gold has been found in limited quantities.

The mean annual temperature near the sea is about 80°. There is no winter or rainy season, but rains fall frequently throughout the year, so that the climate is uniformly hot and moist, and subject to frequent fogs and heavy dews. The annual rainfall is about 100 inches. Where the land is swept by sea breezes the climate is healthful. The districts peculiarly subject to malarial disease of a virulent type are local, and are apt to be contiguous to fresh-water streams or marshes. The animals of the peninsula are numerous. There are eight species of the cat family, the largest the tiger and the leopard, both of large size, numerous, and dangerous. The Indian elephant is here indigenous, and two species of rhinoceros. The buffalo is a native, and is domesticated for riding and for draught. Besides the domestic ox there are two species of wild ox peculiar to the peninsula; a wild and a domestic goat; three species of deer; one small bear; ten species of monkey; and the ant-eater. The bats are the most peculiar of all the animals of the peninsula; one of them, the kalung, or vampire, being larger than a crow, flies high in great flocks, and is destructive of fruit. Sheep, hogs, and some varieties of foreign fowls have been introduced and acclimated. Of birds there are some of great beauty. The *marak*, or wild peacock, the double-spurred peacock, and several species of pheasant are the most remarkable for their plumage. Partridges, snipe, sun-birds, woodpeckers, wild cock, pigeons of numerous species and great variety of size, a brilliant variety of parrots, and kites and hawks abound. Of reptiles there are forty species of snakes, several of them poisonous, particularly the cobra; and the alligator, iguana, and lizards. Fish are abundant and among the finest flavored in the world. They constitute the main food of the people by the seaside. Shell-fish are rare, though shells not containing animals valued for food are large, beautiful, and numerous.

The population of the peninsula is estimated at 500,000, but this is little better than a guess. It is pretty near the geographical center of population of the Malay race, who occupy all its shores, though in the n. part, and especially away from the coast, the Siamese are numerous, and some negroes are found in the interior. The northern part of the peninsula is under the dominion of the king of Siam; the southern has mostly fallen under the sway of the British, whose colony of Malacca (see MALACCA) on the s.w. coast, and Singapore near the s. point, are the local centers of its power. The Dutch ceded the settlement of Malacca and Singapore to the English in 1824, in exchange for concessions in Sumatra and elsewhere. The Malays have been too long renowned for their daring as navigators, and their aggressive piracy, not to have won the consideration of all nations which have come to greatness through the same manifestations of barbarian vigor. Their cruelty and treachery are probably not greater than the cruelty and treachery of European peoples in the centuries succeeding the dark ages; and remembering that the vast and intricate coasts of the islands and countries occupied by the Malays invited all their enterprise to be expended in maritime excursions, and that a forbidding wilderness of jungles and wild beasts repelled enterprise inland, it may not be unfair to place them in the same category of bold rovers as the pirate Norsemen and Danes of our own English ancestry. As to the excessive treachery which has always been attributed to them it is hardly probable that so widespread an opinion is without good basis of fact. Yet those who have of late years had good means of studying their characteristics report that, under kind treatment and fair dealing, they are "transformed into an entirely different character, displaying gratitude, affection, fidelity, and higher sentiments of honor than are found among any other class of natives in India." The vigor and energy of the Malays as seamen and pirates have for centuries made them the terror of the more peaceful East Indians and Mongolians, as well as of the Europeans engaged in commerce with the east. A portion of the inhabitants of the coasts lived at sea rather than upon the land. Their boats, from 20 to 30 ft. in length, were arranged for cooking near the prow, their fishing and other conveniences in the middle, and the sleeping-room in the stern. Thus, with fish for their principal food and the fruits of the shores to be had for the seeking, roving became their daily life, and piracy the natural enterprise of the warlike—as it is of the warlike everywhere—by land or sea The more civilized of the natives are Mohammedans; the others are pagans of many shades. The former claim to be descended from Malays of Sumatra who migrated into or invaded the peninsula in the 11th or 12th c., and drove the former inhabitants into the mountains. Mohammedanism took root here in the 13th c., and Malacca was the capital for rulers who had embraced Mohammedanism from the year 1276. In the 15th c. the peninsula was an appanage of the king of Siam. In 1511 the Portuguese, under Albuquerque, overthrew the Malayan sultan, and asserted Portuguese dominion.

MALAYS (properly, MALAYUS, a Malay word, the derivation of which has not yet been satisfactorily ascertained) is the name given, in a restricted sense, to the inhabitants of the Malay peninsula, but in its wider acceptation, to a great branch of the human family, dwelling not only in the peninsula mentioned, but in the islands, large and small, of the Indian archipelago, in Madagascar, and in the numerous islands of the Pacific. In the fivefold division of mankind laid down by Blumenbach, the Malays are treated of as a distinct race, while in the threefold division of Latham they are

regarded as a branch of the Mongolidæ. Prichard has subdivided the various representatives of the Malay family into three branches, viz. (1), the Indo-Malayan, comprehending the Malays proper of Malacca, and the inhabitants of Sumatra, Java, Celebes, the Moluccas, and the Philippines, with whom, perhaps, may be associated the natives of the Caroline islands and the Ladrones; (2) the Polynesians; and (3) the Madecasses, or people of Madagascar. Accepting this subdivision, we shall, in the present article, confine ourselves to the Malays proper—the natives of Madagascar having been already noticed under that heading; and reserving the Polynesians generally and the Maoris in particular for distinct articles.

In physical appearance, the Malays are a brown-complexioned race, rather darker than the Chinese, but not so swarthy as the Hindus. They have long, black, shining, but coarse hair; little or no beard; a large mouth; eyes large and dark; nose generally short and flat; lips rather thicker than those of Europeans; and cheek-bones high. In stature the Indo-Malays are for the most part below the middle height, while the Polynesians generally exceed it. The Indo-Malays have also slight, well-formed limbs, and are particularly small about the wrists and ankles. "The profile," according to Dr. Pickering, "is usually more vertical than in the white race, but this may be owing in part to the mode of carriage, for the skull does not show a superior facial angle." Such is the general appearance of the Malays proper, or inhabitants of the peninsula and Indian islands. But these also have their subdivisions. There are the civilized Malays, who have a written language, and have made some progress in the arts of life; then there are the sea-people, *orang-laut*, literally, "men of the sea," a kind of sea-gypsies or robbers; and there are the *orang banua*, or *orang utan*, "wild men," or "savages," dwelling in the woods or forests, and supposed to be the aborigines of the peninsula and islands. "These three classes of Malays," says Crawfurd, "existed nearly three centuries and a half ago, when the Portuguese first arrived in the waters of the archipelago, just as they do at the present day. That people describes them as having existed also for two centuries and a half before that event, as, without doubt, they did in times far earlier." Still, while so widely differing in habits, all these speak essentially the same language. The Malays are essentially islanders, and have much of the daring and enterprise for which nations familiar with the sea are famous. Their original seat is by themselves stated to have been Menangkabo, in the island of Sumatra, rather than the peninsula itself. Even the Malays of Borneo claim to have had a Menangkabo origin. Palembang, however, also in Sumatra, has been mentioned as the original seat of Malay civilization; and others, again, point to Java as the source from which both Menangkabo and Palembang received their first settlers. "The Javanese," says Crawfurd, "would seem to have been even the founders of Malacca. Monuments, which prove the presence of this people in the country of the Malays, have even been discovered. Thus, sir Stamford Raffles, when he visited Menangkabo, found there inscriptions on stone in the ancient character of Java, such as are frequent in that island; and he was supported in his conclusion that they were so by the learned natives of Java who accompanied him in his journey. The settlement of the Javanese in several parts of Sumatra is indeed sufficiently attested. In Palembang they have been immemorially the ruling people; and although the Malay language be the popular one, the Javanese, in its peculiar written character, is still that of the court." The Malay language is simple and easy in its construction, harmonious in its pronunciation, and easily acquired by Europeans. It is the *lingua franca* of the eastern archipelago. Of its numerous dialects, the Javanese is the most refined, a superiority which it owes to the influence upon it of Sanskrit literature. Many Arabic words have also been incorporated with it, by means of which the Javanese are able to supply the deficiency of scientific terms in their own tongue. In religion the civilized Malays are Mohammedans, having embraced that faith in the 13th or 14th century. The tribes in the interior and the "men of the sea" have either no religion at all, or such as can be regarded only in the light of most debased superstition. The moral character of the Indo-Malays generally does not stand high; they are passionate, treacherous, and revengeful. Although good sailors, and able to amass wealth by legitimate commerce, they prefer piracy, and numerous have been the victims among European traders to Malay treachery and daring. Indeed, so little faith have Europeans in their professions or engagements, that they will never engage more than two or three of them in a ship's crew, for fear of unpleasant, if not disastrous, consequences.

MALAYS (*ante*) (Mal. *lajo*, Javan. *orang mœlayu*, traveling men, emigrants), a branch of the Mongoloid race which gives name to a large linguistic family, the Malayo-Polynesian. Stretching from Easter island to Madagascar, and from New Zealand to the Northern Sandwich islands, it covers about 13,000 by 5,000 miles. From the island of Hainan as a center, a curve may be described which will fall inside Borneo and cut across the Malay peninsula. If another circle be roughly drawn from Saigon as a center, including Formosa, the Philippines, Celebes, cutting Sandalwood island, and taking in the Sunda groups, including Java and Sumatra, the half-moon so formed shows the country of the true Malay race, and thence the allied dialects spread out like a fan toward Hawaii and New Zealand. This eastern area is cut across by the Papuans, or Australians and Melanesians, from New Zealand to the Ladrones, and from New Guinea to

the eastern Fijis. To the west of the Malay archipelago, southern Ceylon, the Maladirs, and the Seychelles show the probable line of settlement toward Madagascar. It seems at present undetermined how much or how little Malay blood be present in the brown islanders, Polynesians. Wallace, probably best informed of all, considers the Papuans and Polynesians as one in race. Peschel thinks the Australians Papuans of a debased type, and the Sandwich islanders half-blood Malays. Certainly the men of the Ladrones are half-breeds, and there is a distinct mixture of races all along the curve of contact, so that brown men, as in Papua, are mixed with true Papuans, and black Fijis speak a Polynesian dialect. The whole subject can be rightly understood only by a study of the very curious distribution of the fauna, and of the complicated ocean currents. Wallace, in separating these races, thus describes the Malay by contrast: "The Malay is of short stature, brown-skinned, straight-haired, beardless, and smooth-bodied. The Papuan is taller, black-skinned, frizzly-haired, bearded, and hairy-bodied. The former is broad-faced, has a small nose and flat eyebrows; the latter is long-faced, has a large and prominent nose, and projecting eyebrows. The Malay is bashful, cold, undemonstrative, and quiet; the Papuan is bold, impetuous, excitable, and noisy. The former is grave and seldom laughs; the latter is joyous and laughter-loving; the one conceals the emotions, the other displays them. It would seem that the Malays are a nation of emigrants, who have penetrated as far south-east as New Guinea, yet there seem no traces of an indigenous population. The small and barbarous black race, said to occur at various points within the Malay limit, may easily be explained as etiolated and roving Papuans, like the Australians, while the Alfuros and other supposed differing tribes are probably only brown types of half-breeds. The black races of India differ both in language and physique, notably in the hair. There are indications that the original home of the Mongoloid races, which stretch from Styria to east Greenland and from cape Horn to north Norway, may have been in some of the large islands of the Sunda group. The few Malay traditions locate a former seat of power at Menang Kaibo in Sumatra. How far Brahmanism penetrated, if at all, is doubtful, but Buddhism was introduced probably about the 5th c., and, about the end of the 13th, Islam. Nearly at that time they settled in the Malay peninsula, and started a strong government in Malacca, which was finally broken up by the Portuguese in the 16th century. To some 32,000,000 the relative religious proportions are now about as: Evangelical Christians, 7; Roman Catholics, 88; Mohammedans, 800; Buddhists, 60; Pagans, 45. Their language is the *lingua franca* of east Asia, and they penetrate everywhere as traders and pirates. Travelers differ as to their character, some representing them as gentle and polite, others as treacherous and quarrelsome; both views may not be far from the truth, the ruling races in the settlements being lazy and enervated, while many of the wild tribes are so uncivilized as to have been taken for different races. The Battaks are still partly cannibals.

The linguistic relations are thus tabulated:

MONGOLOID RACE.

MALAY-POLYNESIAN FAMILY.

- POLYNESIANS, Eastern Division,
  - *a.* North, — Hawaii.
  - *b.* North-east, — Marquesas.
  - *c.* East, — Tahiti.
  - *d.* Middle, — Rarotonga.
  - *e.* West, — Samoa. Tonga.
  - *f.* South-west, — Maori.
- MELANESIANS, Middle, — Fiji and some dozen neighboring dialects.
- MALAY-JAVANESE, Western,
  - 1. TAGALA, Islands,
    - *a.* North-east, — Ladrones.
    - *b.* North, — Formosa.
    - *c.* South, — Philippines.
    - *d.* West, — Malagassi.
  - 2. MULAYU-JAWI, Archipelago,
    - *a.* North, — Malay.
    - *b.* South-west, — Javanese.
    - *c.* South, — Sunda.
    - *d.* Many patois of the islands and of savage tribes, orang laoot, orang bajav, etc.

The Malay tongue (*bahasa jawi, mænjawikau,* to talk Malay) is probably a dialect of north Sumatra, of which Jawa is the old name. The old literary alphabet is the Kawi, probably formed from Pali, through either a Birmani or Siamese medium, about the 6th c., is neither crumpled like the one nor rounded like the other, but is easily recognized by its square and nearly identical letters. They are h, n, ch, r, k, d, t, s, w, l, p, d thick, dh, y, ny, m, g, b, t thick, ng, rl, lr. Vowel sounds: a, œ as in *but*, i, u as in *boot*, e as in *cane*, o, au as in *now*. Originally there were less than a dozen, with few or no aspirates or fricatives, but with the nasals. It is now written in a peculiar Arabic Neskhi, with 29 consonants and 8 vowel sounds. Other alphabets of the family are in Bugi, Manhkásar, Celebes, a new one self-evolved by the Battaks, and one in the Philippines which resembles most a true Indian. Malay literature is rich, but little original.

There is a romantic and mythological poem, founded as usual on the Mahabharata; plays and recitations like the Siamese; love songs and popular songs, simple and most

interesting of all; and tales from the Arabic and Sanskrit, including animal-myths, in which the jackal (Sans. *srigala*) plays the chief rôle. The Malay is not an isolated language, yet it has not now the usual flexibility of an agglutinating one, nor must the reader ever expect in such a tongue the idea of either time or regimen; the verbs appear under aspects, as in Russian, and the nouns in relation, as in Hebrew. Roots, supposedly one syllabled, are enlarged by affixes, strong consonants being precessed and the three nasals inserted or substituted whenever possible. Vowel change plays a great rôle, evolving, with precession, sometimes a dozen words. Interior contraction is the rule. Doubling is carried to its limit; either of the whole word with or without modification; with initial change; with a play upon similar syllables like Basque, or with insertion of a preposition. Prepositions are partly prefixed, partly suffixed, and it is not always easy to say whether they influence most, or exactly in what way, a noun or a verb, as in so-called Semitic participles. Much the same may be said of pronouns. On the whole, the language is easy, soft-sounding, with a nasal clang, and a great capacity for crude metaphor in plays upon words and expressions of complicated relations. Authorities: W. v. Humboldt, *Ueber d. Kawi-spr.* (1840, 3 vols.); Fr. Mueller, *Ueb. d. Ursp. d. Schrift d. mal. Voelker, Bul. W. Akad* (1865); Waitz, *Anthropol. d. Naturvoelker* (1869, 5 vols.); *The Races of Man*, Oscar Peschal (1876, 1 vol.); *The Malay Archipel.*, A. R. Wallace (1869, 2 vols.); *The Geog. Distrib. of Animals*, A. R. Wallace (1876, 2 vols.); *The Science of Language*, A. Horclacque (1877, 1 vol.).

MALBONE', EDWARD G.; 1777–1807; b. Newport, R. I.; at the age of 17 resided in Providence as a portrait-painter; removed in 1796 to Boston and pursued his profession with success; accompanied Washington Allston to Charleston in 1800, and sailed for Europe in 1801; met in London, Benjamin West, president of the royal society, who urged him to make that city his permanent residence; but he returned to Charleston. For several years he traveled extensively in the United States, and painted miniatures in the chief cities; visited the West Indies in 1806 for his health. His best picture is "The Hours;" the present, past, and future, being represented by three female figures.

MALCOLM, the name of four kings of Scotland. Malcolm MacDonald succeeded to the throne on the abdication of Constantine MacAodh in 944 A.D. The most important event of his reign was the cession of Cumbria, in 946, by the English monarch Edmund I. Malcolm was slain while engaged in quelling a revolt in the north of Scotland, in 953 A.D.

Malcolm MacKenneth, grandson of the preceding, ascended the throne in 1003. His life was passed chiefly in repelling the incursions of the Danes. He died in 1033. A collection of laws, the *Leges Malcolmi MacKenneth*, has been attributed to him, but is obviously a work of a later age.

Malcolm MacDuncan, surnamed CAN-MORE (Celtic, *Cean-more*, "Great Head"), was born about the year 1024, and ascended the throne on the death of Macbeth MacFinlegh, in Dec., 1056, or of Lulach MacGilcomgain, in April, 1057. For the first nine years of his reign, Malcolm was at liberty to devote his energies to the consolidation of his kingdom, England being then ruled by the peaceful Edward the confessor. After William of Normandy had settled himself on the English throne, many noble Saxons sought refuge at the Scottish court, and among them Edgar Atheling, nearest of kin to the confessor, with his mother Agatha, and his sisters Margaret and Christina. Margaret, who was young, beautiful, and pious, captivated the heart of the Scottish king, and a marriage quickly followed. Her biographer, Turgot (also her chaplain and confessor), tells us how earnestly and affectionately she labored to civilize the people and to "enlighten" her husband. Malcolm, although a man of vigorous intellect, could not read her missals and books of devotion, but he used to kiss them in token of reverence, and he caused them to be richly bound, and ornamented with gold and jewels. The retinue of the king began to show something of a royal magnificence, and his plate was, according to Turgot, "at least gilt or silvered over." But Malcolm's new relations, unfortunately, embroiled him with the Normans. In 1070 he crossed the border, harried Northumberland and Yorkshire, but was soon obliged to retreat. William the conqeror retaliated in 1072, and wasted Scotland as far as the Tay. At Abernethy, Malcolm was compelled to acknowledge him as his liege lord but (as the Scottish historians hold) only for such parts of his dominions as had belonged to England—viz., Cumbria and the Lothians. War broke out again between England and Scotland on the accession of William Rufus, probably at the instigation of the fugitive Anglo-Saxons and the discontented Normans, who had been pouring into the country during the iron reign of William, and had obtained large grants of land from the Scottish monarch. Nothing of note, however, happened, and peace was again concluded; but the seizure of Carlisle by the English king not long after provoked a fresh rupture, and, in 1093, Malcolm again crossed the border, and laid siege to Alnwick; but while so engaged, he was suddenly attacked, defeated, and slain, Nov. 13, 1093. His wife died immediately on hearing the fatal news.

Malcolm, surnamed "The Maiden," grandson of David I., succeeded that monarch, May 24, 1153, when only in his 12th year. He had no sooner mounted the throne than a Celtic insurrection, headed by Somerled, lord of the Isles, broke out. Some years after, another insurrection broke out among "the wild Scots of Galloway," under their

chief Fergus, to crush which Malcolm had to employ a large force. In 1161 he had to chastise a revolt of the men of Moray, and to put down a second rebellion of Somerled. He died at Jedburgh, of a lingering disease, Dec. 9, 1165, at the early age of 24.

MALCOLM, Sir JOHN, G.C.B., a British statesman and historian, was b. at Burnfoot, parish of Westerkirk, Dumfriesshire, May 2, 1769, and at the age of 14 went to India as a cadet in the Madras army. About 1790 he commenced to devote his leisure hours to the study of the oriental languages, especially Persian. He distinguished himself at the siege of Seringapatam in 1792, and was appointed to the staff as Persian interpreter. In 1800 he was sent as ambassador to Persia, to form an alliance with that country against Bonaparte, in which he succeeded. In 1802, 1807, and 1809 he was again sent as minister-plenipotentiary to the Persian court; and shortly before his final return, received from the shah the order of the "Sun and Lion," and the titles of "Kahn" and "Sepahdar of the Empire." In 1803 he had been appointed president of Mysore; and during the two following years his administrative talents had been of most important service to the government in reducing to order and tranquillity the newly conquered Mahratta states. In 1812 he returned to England, received the honor of knighthood, and, after a lapse of five years, returned to India as the governor-general's political agent in the Deccan, and with the rank of brig.gen. in the Indian army; in the latter capacity he greatly distinguished himself in the wars against the Pindarris and Holkar. In 1827 he was appointed governor of Bombay, but finally left India in 1830. He died of paralysis at Windsor, May, 1833. Malcolm's writings are highly esteemed as authorities; they are: *A History of Persia* (London, 1815, 2 vols. 4to; 2d ed. 1828); *Memoir of Central India* (2 vols. London, 1823); *Political History of India from* 1784 *to* 1823 (2 vols. 8vo. 1826); and *Life of Lord Clive* (London, 1836), a posthumous work. The life and correspondence of Malcolm were published by John W. Kaye, in 2 vols. 8vo (London, 1856).

MALCOM, HOWARD, D.D. LL.D., 1799–1879; b. Philadelphia; graduated at Dickenson college in 1817; studied theology at Princeton seminary; was ordained, and settled as pastor of a Baptist church at Hudson, N. Y. In 1825–26 he traveled extensively in behalf of the American Sunday-school Union in whose organization he took a prominent part; in 1827 he was pastor of the Federal Street Baptist church, Boston; in 1835 he was sent to visit the Baptist missions in India, Burmah, Siam, China, and Africa; in 1839–49 was president of the college at Georgetown, Ky., and of the university of Lewisburg, Penn., in 1851–59, acting also as professor of mathematics and moral philosophy in both institutions. On account of throat disease he left the university and retired to Philadelphia. In 1841 he received the degree of D.D. from the university of Vermont and Union college, N. Y., at the same time, and of LL.D. from the Lewisburg institution after his resignation. He was one of the founders of the American tract society, and a vice-president from the beginning. He published a *Dictionary of the Bible*, which was often republished in this country and in England; *Travels in South-eastern Asia; Index to Religious Literature; Nature and Extent of the Atonement; The Christian Rule of Marriage; Memoir of Mrs. Malcom;* edited also *The Imitation of Christ;* Robert Hall's *Help to Zion's Travelers;* Law's *Serious Call;* Butler's *Analogy of Religion*, with introduction, notes, etc. He has published also several addresses, and contributed many papers to periodicals.

MALCZEW'SKI, ANTONI, 1792–1826; b. Poland; educated by a French private tutor at his home in Dubno, and subsequently a student at Krzemieniec, where he showed a decided aptitude for mathematics. In 1811 he entered the Polish army in the hope of gaining a position which would enable him to marry a cousin with whom he had fallen in love—the family estate, impoverished by his father, a gen. in the Polish and afterwards in the Russian army, being insufficient to justify him in marrying. She married, however, a richer man, in 1812, and Malczewski's character seems to have derived from this disappointment a misanthropy, which is manifest in all his poetry. When Russia took possession of Poland he received an appointment on the suite of Alexander II., but in 1816, in consequence of a duel, left the army and spent the next five years in travel in Switzerland, Italy, and France. In 1821 he settled on a farm in the Ukrains, and during his residence there devoted himself to the study of his native language, which he had long neglected for the French. He had spent what property he had during his travels, his farming experiment proved a failure, and he was dependent on the charity of his landlord for the lodgings in Warsaw where he died. His poem *Maria*, in two cantos, was published at Warsaw shortly before his death. It had been written at his farm in the Ukraine. Received with entire neglect at first, then attacked on the score of its deficiencies in language and versification, it finally took a place in popular favor second only to some of the works of Mickiewicz.

MAL'DAH, a t. of British India, in Bengal, the chief t. of a district of the same name, is situated on the left bank of the Mahununda, about 190 m. n. of Calcutta. In the rainy season it is nearly insulated. It is a wretched place, consisting of ruined houses, forming narrow, irregular streets. Pop. '71, 5,262.

MAL'DEGEM, a small manufacturing t. of Belgium, East Flanders, 17 m. n.w. of Ghent. Population upwards of 6,000, who are employed in the manufacture of tobacco, and in brewing and cotton-printing.

MALDEN, a t. of Middlesex co., Mass., 4 m. n. of Boston, on the Boston and Maine railroad; pop. 7,367; the Malden river furnishes water-power for several factories. There are 2 weekly newspapers, 2 banks, and hotels, schools, etc. It is one of the suburbs of Boston, and has attracted from that city a fine class of business men, who find it a pleasant home.

MAL'DIVE ISLANDS, a chain of low coral islands in the Indian ocean, about 400 m. w.s.w. of Ceylon. They extend 500 m. in length by 45 m. in average breadth, and consist of 17 groups or atolls, each atoll surrounded by a coral reef. The entire number, including the islets, is estimated at about 50,000. Mali, the largest of the chain, and the residence of the native prince, who is called "the sultan of the twelve thousand isles," is 7 m. in circumference, and contains a population of 2,000. The population of the whole chain is estimated at 150,000. Each island is circular in form, with a lagoon in its center, and has an elevation above the sea in no case of more than 20 ft. at high-water mark. The larger and inhabited islands are clad with palm, fig, citron, and bread-fruit trees. Grain is also abundantly produced. Wild-fowl breed in prodigious numbers; fish, rice (imported from Hindustan), and cocoa-nuts constitute the food of the inhabitants, who are strict Mohammedans. The "sultan" sends an annual tribute to the governor of Ceylon.

MALDON, a market t., river port, and municipal and parliamentary borough of England in the county of Essex, a mile below the confluence of the Chelmer and the Blackwater, and 9 m. e. of Chelmsford. Besides the manufacture of crystallized salt, brick-making, brewing, and iron-founding, the usual branches of industry connected with a port are carried on. In 1872, 1139 vessels (67,161 tons) entered, and 805 (36,144 tons) cleared the port. Since 1867 Maldon returns only one member of parliament. Pop. '71 5,586.

MALEBRANCHE, NICOLAS, a French philosopher, b. Aug. 6, 1638, at Paris, where his father was president of the chamber of accounts. He was deformed and sickly, and from his childhood fond of solitude. At the age of 22 he entered into the congregation of the oratory, and devoted himself to the study of Bible history and of the fathers of the church till Descartes's treatise, *De Homine*, falling into his hands, attracted him to philosophy. His famous work, *De la Recherche de la Vérité* (3 vols. Paris, 1674, and other editions), displaying great depth and originality of thought, combined with perspicuity and elegance, had for its object the psychological investigation of the causes of the errors to which the human mind is liable, and of the nature of truth and the way of reaching it. He maintains that we see all things in God (his famous *Vision en Dieu*); that all beings and thoughts exist in God (*Dieu est le lieu des esprits, comme l'espace est le lieu des corps*); and that God is the first cause of all changes which take place in bodies and souls, which are therefore merely passive therein. His system is a kind of mystic idealism. It was immediately opposed by Ant. Arnauld, Bossuet, and many others, and was subjected to a thorough and critical examination by Locke and Liebnitz. Besides the work above mentioned, Malebranche wrote a *Traité de Morale*, a *Traité de la Communication de Mouvement*, and *Conversations Métaphysiques Chrétiennes*, in the last of which he endeavored to exhibit the harmony of his philosophic views with Christianity. He died at Paris (as English critics are fond of saying) of a dispute with the subtle Berkeley, Oct. 13, 1715.

MALE FERN. See FERN, MALE.

MALESHERBES, CHRÉTIEN GUILLAUME DE LAMOIGNON DE, a distinguished French statesman, was b. at Paris, Dec. 6, 1721, and educated at the Jesuits' college; he became counselor to the parliament of Paris in 1744, and succeeded his father as president of the court of Aids in 1750, where his clear judgment, strict integrity, and humane disposition enabled him to be of great service to his country. A quiet but determined opponent of government rapacity and tyranny, he watched the ministry with a jealous eye, and was indefatigable in his efforts to prevent the people from being plundered. About the same time (1750) he was appointed censor of the press. This was a most unsuitable office for him, but he appears to have accepted it lest it should fall into the hands of some mere bigot or court hireling; and so tolerant was he that French authors pronounce the period of his censorship "the golden age of letters." To Malesherbes we owe, among other things, the publication of the famous *Encyclopédie*. In 1771 his bold remonstrances against the abuses of law which Louis XV. was perpetrating, led to his banishment to one of his estates. At the accession of Louis XVI. (1774), who esteemed Malesherbes, he was recalled, and entered Paris in triumph. In 1776 he resigned, on the dismissal of Turgot, all official employment, and, from this period on to the revolution, spent his time in travel or in the improvement of his estates. The first storms of that wild period passed by and left him unscathed; but when he heard that the unfortunate king, who had always neglected to profit by his advice, was about to be tried by the convention, he magnanimously left his retreat and offered to defend his old master. The convention granted permission, but from that day Malesherbes was himself a doomed man. He was arrested in the beginning of December, 1793, and guillotined April 22, 1794 along with his daughter and her husband, M. de Chateaubriand, brother of the famous author of that name. Malesherbes was a member of the French academy, an able writer

on political, legal, and financial questions, and one of the most virtuous and high-minded statesmen of the 18th century.

MALET, CLAUDE FRANÇOIS DE. See MALLET, *ante*.

MALHERBE, FRANÇOIS DE, 1555–1628; b. Caen, France; son of an untitled magistrate. His education was begun at Caen, continued in Paris, and completed by travel under the tuition of a Calvinist, Richard Dinoth, who accompanied him to Heidelberg and Basle. But religious instruction irritated him. He broke with his father, who was a Calvinist, and found favor with Henry, duc d'Angoulême, to whom he became private secretary at Aix. He was already noted for his critical taste in poetry, though not for his own productions, and acquired a fame for the piquant ill-nature of his wit. Naturally it brought him ill fortune, and for many years after the death of his patron he suffered for means to live. His poem *Larmes de St. Pierre*, published in Paris in 1587, was his first noted work. Near 1600 the attention of Henry IV. was attracted to the poet, who soon after was called to the court, and from that time ranked as the first poet of France. Avarice, wit, in epigram and verse, and terse forms of expression, were his characteristics.

MALIBRAN, MARIA FELICITA, one of the most celebrated mezzo-soprano singers of recent times, b. at Paris, Mar. 24, 1808, was the daughter of Manuel Garcia, a Spanish singer and teacher of singing. When she was still very young her reputation extended over Europe. Her father attempted to establish the Italian opera in New York, but without success; and, on account of his circumstances, she married M. Malibran, a Frenchman, who was supposed to be one of the richest merchants of that city, but who soon became bankrupt, on which she went again upon the stage, and was received with great enthusiasm in France, England, Germany, and Italy. She expended, with remarkable benevolence, the great sums which she won. Her first marriage having been dissolved, she married M. Beriot, a famous violinist, in 1836; but in September of that year she died at Manchester, whither she had gone to take part in a musical festival. Malibran was a woman of noble heart and high intellect, and her conversation possessed an exquisite fascination. She has left a number of musical compositions, some of which are deservedly popular. A memoir of her was published in England shortly after her death, by the Countess of Merlin.

MALIC ACID ($C_8H_4O_8$,2HO), so called from *malum*, the Latin word for an apple, occurs abundantly in most acidulous fruits, particularly in unripe apples, gooseberries, and currants, in which it is found as an acid or super-salt of potash or lime, which gradually changes into a neutral salt as the fruit ripens. It crystallizes in groups of radiating acicular prisms, but, as the crystals are very deliquescent, it is usually obtained as a syrupy, semi-transparent mass, with a very sour smell, and readily soluble in water and alcohol.

The chemical changes which this acid undergoes under the influence of various reagents are very singular, and serve to illustrate many points in vegetable physiology in reference to the maturation of fruits, etc. Thus, nitric acid converts it into oxalic acid; hydrated potash, into oxalic and acetic acids; ferments, into succinic, butyric, acetic, and carbonic acids and water. When heated to about 350° it loses the elements of water and becomes converted into the two isomeric acids, malæic acid and fumaric acid (q.v.).

Malic acid forms two series of salts with bases, namely, neutral and acid salts. The most characteristic of these salts are the neutral malates of lead and of lime.

MALICE. While malice, in its ordinary sense, means an evil disposition or state of mind of one person towards another, in law it denotes the intent or purpose which precedes and causes an unjustifiable, illegal act. Malice, in law, is not confined to a particular intent of an act to the injury of a particular person, but to a general intent of injury preceding the unlawful act; thus, if one shoot A., intending to shoot B., he is nevertheless guilty of murder with malice prepense. Malice, in law, is divided, for convenience of proof, into express and implied. Express malice is where the defendant's intent to commit the crime is directly proved; implied malice is where the intent to commit the crime is presumed by the law from the facts, and where a defendant is shown to have intended an act, he is presumed to have intended all the consequences of that act. In the law of torts, malice means the unjustifiable commission of an act injurious to another.

MALICIOUS PROSECUTION, a prosecution, either criminal or civil, by regular process of law, unwarranted by the proved facts, and instituted without probable cause. As the person against whom such prosecution has been brought has been arrested or imprisoned if it were by criminal suit, and has been put to expense if it were by civil suit, he has a right to sue, and, if he can establish the groundlessness of the prosecution, to recover from the person who instituted it. The person who brings an action for malicious prosecution must show that the former action was groundless and is at an end; that it was conducted in regular course of law before a court of competent jurisdiction; and that it was malicious and without probable cause. Probable cause exists when there were such circumstances as would properly justify a man of sound discretion and reason in believing that the defendant committed the act for which the prosecution was begun. In the absence of probable cause, malice will be inferred; but if it be con-

clusively shown that the prosecutor acted in good faith, evidence of actual malice must be given. But, on the other hand, if probable cause be shown, proof of actual malice will not maintain an action. The guilt or innocence of the person prosecuted does not affect the question of probable cause, which depends upon the evidence of the existence, in the prosecutor's mind, of a belief, founded upon reasonable grounds, of the guilt of the accused person. What constitutes probable cause is a mixed question of law and fact; that is, if there be no dispute as to the facts, the court decides whether those facts constitute probable cause; but if the facts are disputed, the jury are to find the facts, under instruction from the court as to what facts are sufficient to make out probable cause.

MALIGNANT DISEASES, a name applied to those affections of the animal system characterized by a disposition to the formation of products which have the power of propagation at the expense of the normal tissues, or which so poison the blood that it soon becomes unfit to maintain life. Some of these diseases are tumors (q.v.), and come within the province of the surgeon, while others are the subjects of the physician. The principal malignant tumors are cancer (q.v.), and sarcoma (q.v.). The term malignant applied to diseases not surgical is sometimes rather indefinite, although in some cases the application is entirely appropriate. Scarlet fever, when of a very severe form, with sloughing of the affected tissues of the throat, and with blood-poisoning to the extent of producing death in 48 hours, is truly called malignant; but when less severe, although very dangerous, it is often called semi-malignant, and most cases are characterized by more or less tendency to malignancy. So in diphtheria, the severe cases, and which are more properly called putrid fever, or malignant sore throat, are essentially malignant. Asiatic cholera (q.v) is a malignant disease, and one of its names is malignant cholera. Malignant pustule (q.v) is also a malignant affection, but according to John Hunter's definition it would, perhaps, come under the head of tumor. One form of intermittent fever (q.v.) is truly malignant, as in some cases it is incurable, poisoning the blood and affecting the nervous system in a really malignant manner. There are forms of small-pox which are called malignant, but the term in this disease is of rather indefinite application, the disease not being essentially malignant, and only taking on that character because of the *excessive amount* of morbid matter, whereas the poison of diphtheria and of malignant or pernicious intermittent fever appears to possess intrinsic malignancy independent of quantity.

MALIG'NANT PUSTULE is a contagious and very fatal disease, common in France, where it bears the name of *charbon*, but of comparatively rare occurrence in England. It begins as a small, dark-red, painful spot, on which there soon appears a pustule or vesicle, seated on a hard, inflamed base. When this is opened, a black slough becomes apparent. This sloughing spreads rapidly, involving the cellular tissue, and sometimes even the adjacent muscles.

The disease appears to be caused by infection from horned cattle, which are sometimes affected by a similar disease, but it also arises by inoculation of diseased fluids. It is believed that flies which have alighted on the ulcers of diseased animals may occasionally convey the infection. The constitutional symptoms are much the same as those of putrid typhus fever; while the treatment consists in destroying the diseased surface by powerful caustics, in keeping up the strength by wine, brandy, beef-tea, bark with nitric acid, etc.; and in giving opiates in sufficient doses to relieve the pain during the day and to procure sleep at night.

MALIGNANT TUMORS. See CANCER and TUMOR.

MALINES', or MECHLIN, one of the chief cities of the Belgian province of Antwerp, 15 m. s.s.e. of the city of that name, on the navigable river Dyle. The pop. was, in 1876, 39,029. It has fine squares, noble buildings, and wide, regular streets, but is devoid of all signs of life and industry, having lost its former greatness, and fallen far behind all other Belgian cities in commercial enterprise and industrial activity. As the see of the cardinal-primate of Belgium, it still retains a certain degree of ecclesiastical importance, and possesses numerous churches, the most noteworthy of which is the cathedral of St. Romuald, a vast building, covering nearly two acres of ground, and adorned in the interior with many fine pictures and choice carvings. It was built between the 12th and 15th c., but one tower, 345 ft. in height, remains unfinished. The other objects most worthy of notice are the churches of St. John and of Our Lady, which contain works by Rubens; the town-hall, dating from the 15th c., and known as the Beyard; the market hall, an ancient building, with towers, erected in 1340, and now used as a guard-house; the splendid modern archiepiscopal palace; and the monument to Margaret of Austria, erected in 1849. Malines has two clerical seminaries, an academy of painting, a gymnasium, and a botanical garden. It still retains some of the important lace manufactories, for which it has been long noted, and manufactures caps and woolen goods, besides having considerable breweries. Malines constitutes an important central point of junction for the entire Belgian system of railways.

MALING'ERING, a term derived from a similar French word, signifies the feigning of disease, in order to avoid duty. This offense is punished very severely in the British army. For further particulars, see FEIGNING OF DISEASE.

MALL, or PALL-MALL (pr. Pell-Mell), a name given to places in London and other English towns where there were once alleys for playing tennis. See BALL.

MALLARD. See DUCK, *ante*.

MALLEABIL'ITY is the property which certain metals possess of being reducible to thin leaves, either by hammering (hence the corresponding German word, *hämmerbarkeit*) or by lamination between rollers. The order in which the malleable metals exhibit this property is as follows: gold, silver, copper, platinum, palladium, iron, aluminium, tin, zinc, lead, cadmium, nickel, cobalt. Gold far surpasses all the other metals in malleability, being capable of reduction into films not exceeding the 200,000th of an inch in thickness; and silver and copper may be reduced to leaves of great tenuity. Although gold and silver also present the property of *ductility* (q.v.) in the highest degree, there is no constant relation between the two properties; for example, iron, although it may be reduced to extremely thin wire, is not nearly so malleable as gold, silver, or copper.

MALLEA'CEÆ, a family of lamellibranchiate mollusks, regarded by many as a subfamily of *aviculidæ* (see PEARL OYSTER), and of which the typical genus *malleus* is remarkable—in an adult state—for the elongation of the ears of the shell, the other part of which at the same time assumes a curiously elongated, wavy, or crumpled form. The shell thus acquires the name of HAMMER SHELL. The species are natives of the East and West Indies and of the South seas.

MALLET, CLAUDE FRANÇOIS DE, b. June 28, 1754, at Dôle in Franche-Comté, became an eager supporter of the revolution, rose to the rank of a brig.gen. in 1799, was intrusted with the government of Pavia in 1805, but was removed from his office because of his extreme republicanism. He returned to Paris, and was engaged in a number of republican plots. Being, in June, 1812, thrown into confinement along with some royalists, he formed with them a scheme for overthrowing the empire during Napoleon's campaign in Russia. He made his escape from prison on the night of Oct. 23–24, along with the abbé Lafon, and entering the barracks, informed the soldiers that the tyrant had perished in Russia. He proceeded to liberate generals Guidal and Lahorie from prison; and having previously gained the support of a battalion of the Parisian guards, he called them to arms, and went to the residence of Hullin, the commandant of the city, whilst Lafon went with a platoon to the prefecture. He told Hullin of the death of the emperor, and the establishment of a provisional government, and on his manifesting doubt, drew a pistol and fired it in his face, wounding but not killing him; whereupon the adjutant, Laborde, rushing in, Hullin and he together overpowered Mallet, and took him prisoner. When interrogated, he declared that he would have made all France and all Europe his debtors if his enterprise had been successful, and maintained the same resolute coolness to the last. He was shot, along with his principal fellow-conspirators, Oct. 29, 1812.

MALLET, PAUL HENRI, 1730–1807; b. Switzerland. In 1752 he became professor of French literature in the university of Copenhagen, and gave his attention to the origin, antiquities, and mythology of the ancient peoples of the north, publishing the results of his study in the *Introduction à l'Histoire du Danemark*, published in Copenhagen, 1755–56. Returning to Geneva in 1760 to fill the chair of history in the academy, he became a member of the council of two hundred in 1764; visited Italy and England in 1766–67, and was charged by the queen of England to write the history of the house of Brunswick; in 1792 was obliged to leave Switzerland on account of his aristocratic affiliations; returned in 1801. His works, in addition to that noted above, are: *Mémoirs sur la Litérature du Nord*, 1759–60; *Monuments de la Mythologie et de la Poesie des Celts; De la Forme du Gouvernement Suedois;* and several works on Swiss history, books of travel, and a Swiss dictionary.

MALLOW, *Malva*, a genus of plants of the natural order *malvaceæ*, having a 5-fid calyx, with an outer calyx of three leaves; stamens cohering in a tube; numerous styles cohering at the base; and numerous one-seeded carpels fixed in a whorl around an axis, and forming a separable orbicular fruit. The species are herbaceous plants, or more rarely shrubs.—The COMMON MALLOW (*M. sylvestris*) is plentiful over most of Europe, and in Britain on waysides and heaps of rubbish. It is a perennial, with rather large bluish-red flowers on erect stalks. The DWARF MALLOW (*M. rotundifolia*), also a common native of Britain, has smaller whitish or reddish-white flowers. These two plants have a mucilaginous and somewhat bitter taste, and the leaves are used as an emollient and demulcent medicine; a decoction of them being employed in cases of irritation of the pulmonary and of the urinary organs; and poultices made of them are very frequently employed to allay external inflammation. Other species have similar properties.—The MUSK MALLOW (*M. moschata*), not unfrequent in England, but rare in Scotland, has a faint musk-like smell.—The fiber of *M. crispa* is used in Syria for textile purposes, and the fibers of many species are probably fit for similar use, and for the manufacture of paper. The young leaves of some are occasionally used as boiled vegetables.—A species of mallow (*laxatera arborea*) grows on the Bass Rock, and adjacent mainland of Haddingtonshire.

MALLOW, a market t. and parliamentary borough of Ireland, in the county of Cork, is beautifully situated on the left bank of the Blackwater, 19 m. n.n.w. of the

county town. On the opposite side of the river, which is here crossed by a bridge of three arches, is the suburb of Ballydahin. The town is resorted to in summer on account of its mineral waters, and contains a neat spa-house. Tanning, brewing, and the manufacture of salt are carried on. Near Mallow are large flour-mills. Pop. '71, 4,165. Mallow returns one member to the house of commons.

MALMAISON, La, a village 7 m. w. of Paris, with many historical souvenirs. The name is derived from the fact that it was a favorite resort of robbers in the 9th c., whose depredations in the neighborhood gave their place of sortie the name *mala mansio*. In the 13th c. it was but a part of a farm; in the 14th it was attached to the property of the abbaye St. Denis. Occupied successively by families of little note during succeeding centuries, it happened to be purchased in 1798 by the widow Josephine Beauharnais, who paid about $32,000 for the property. The charms of her society there attracted not only the general Bonaparte, but much of the most elegant society of France in 1798–99. The place was tastefully improved, and became the meeting place for poets, authors, politicians, and the military celebrities of the day. Some of the most beautiful and fascinating women of France aided Josephine to make it one of the centers of a society which sought to reproduce the courtly manners of old France, with the advent of the new military era of Napoleon, who here wooed the future empress. It was largely through her fine tact in making powerful friends at Malmaison that Napoleon was enabled to make the *coup d'etat* in 1799 which made him first consul. After her marriage Josephine continued to embellish the park with gardens, summer-houses, grottoes, waterfalls, lawns and parterres and farm and shepherd cottages; and the chateau was greatly improved in many ways and made interesting by a library and the choicest works of art and materials for pleasure, until it finally became a little palace. After Josephine became empress Malmaison was little occupied, until the divorce in 1809, when she retired to it, and kept up a little court. Alexander of Russia visited her there just before her death in May, 1814. After Napoleon's return from Elba he went to visit the scene of his first love, and two months later, after the defeat of Waterloo, he passed five days there with Hortense de Beauharnais, ex-queen of Holland. The property then reverted to her son, Eugène de Beauharnais. In 1826 it was purchased by a Swedish banker, Haguerman; in 1842 by queen Maria Christina of Spain for 500,000 francs; and in 1861 by Louis Napoleon for 1,500,000 francs, and by him improved and restored to much of its ancient beauty.

Among the paintings most interesting at Malmaison is a portrait of Josephine by her daughter Hortense; and one of Bonaparte at Malmaison by D'Isaby.

MALMESBURY, a market t. and parliamentary borough of England, in the co. of Wilts, 20 m. n.n.w. of Devizes, and 96 m. w. of London. Pop. (1871) of parliamentary borough, 6,879. It returns one member to the house of commons.

Malmesbury is a very ancient and interesting town. Here, according to William of Malmesbury, a monastery was founded before the year 670. The abbey afterwards became a cloth-factory. The remains of the abbey-church, partly early Norman, and partly decorated English, may still be seen. There are several other relics of antiquity in the place.

MALMESBURY, James HARRIS, first earl of, 1746–1820; b. England; son of James Harris, the author of Hermes. He was educated at Winchester, Oxford, and Leyden, and, after traveling on the continent, was appointed, at the age of twenty-one, secretary of the Spanish embassy through the influence of lord Shelburne. He was acting as *chargé d'affaires* at Madrid, at the time of the dispute between England and Spain in regard to the Falkland islands, and he displayed such skill in the negotiations in this affair, that, in 1771, he was appointed minister-resident at Berlin, where he remained for four years. In 1777 he was made ambassador to Russia, and in 1780 he received the order of the bath. The state of his health compelled him to leave St. Petersburg in 1784, and he soon accepted from the Pitt ministry the post of minister to the Hague, to which it had been the intention of Fox, to whose party he belonged, to send him. There, in 1788, he succeeded in negotiating a treaty of alliance between Holland and Prussia; and in acknowledgment of his services was made baron Malmesbury the same year. Returning to England he entered parliament, of which, in spite of his long absences, he had been a member since 1770. He was a whig till 1793, when he became a supporter of the administration, and Pitt sent him once more to negotiate a treaty between England, Prussia, and Holland, a mission which he successfully discharged. In 1794 he negotiated the marriage between the prince of Wales and Caroline, daughter of the duke of Brunswick. In 1796 he went to Paris and in 1797 to Lisle on fruitless negotiations for peace with the French republic; and these were his last missions, as he deemed himself incapacitated by a growing deafness from taking further part in public affairs. In 1800 he was made earl of Malmesbury and viscount Fitzharris.

MALMESBURY, James Howard HARRIS, third earl of; b. England, 1807; grandson of the first earl. He was educated at Eton and Oxford; was returned to parliament as a conservative in 1841, but succeeded his father in the peerage the same year. He was secretary for foreign affairs in lord Derby's first administration, and was efficient in bringing about the recognition of Louis Napoleon by the French empire. Lord Malmesbury occupied the same position in the second cabinet of lord Derby, when he endeavored to prevent the war between France and Italy, and Austria. When Lord Derby formed his

third government in 1866 he declined to be foreign minister on account of his health, but became lord keeper of the privy seal, remaining in office till 1868. From 1874 to 1876 he was again privy seal. He edited *The Diaries and Correspondence* of his grandfather, 1844; and *The First Lord Malmesbury and his Friends*, 2 vols. 1870.

MALMESBURY, WILLIAM OF, an early English historian, was b. near the close of the 11th c., probably in Somersetshire, educated in the monastery whence he derived his name, and of which he became librarian. He died some time after 1142, but the exact date is not known. Malmesbury's principal works, which are written in Latin, are *De Gestis Regum*, a history of the kings of England from the Saxon invasion to the 26th year of Henry I.; *Historiæ Novellæ*, extending from the 26th year of Henry I. to the escape of the empress Maud from Oxford; and *De Gestis Pontificum*, containing an account of the bishops and principal monasteries of England from the conversion of Ethelbert of Kent by St. Augustine to 1123. The first of these was translated into English by the rev. John Sharpe (Lond. 1815), and has been reprinted in Bohn's antiquarian library, under the editorship of Dr. Giles (1847). Of his other works, Gale has printed his *Antiquities of Glastonbury*, and Wharton his *Life of St. Wulstan*, in his *Anglia Sacra*. Malmesbury gives proof in his writings of great diligence, good sense, modesty, and a genuine love of truth. His style is much above that of his contemporaries.

MAL'MÖ, or MALMÖHUUS, a Swedish province or læn on the Baltic; 1852 sq.m.; pop. '73, 322,175. Its capital city, bearing the same name, is 16 m. s.e. of Copenhagen, and has over 25,000 population, situated on the sound. The principal export of the province is grain; horses and cattle are bred in large numbers, and the city is well supplied with schools of a high grade, and is very prosperous.

MAL'MÖ, the principal town of the "læn," or district, of Malmöhuus, in Sweden, is situated on the sound, nearly opposite Copenhagen, and had, in 1874, a population of 30,676. Malmö is a busy sea-port, maintaining an active steam and sailing communication with Copenhagen and all the great Baltic and German ocean ports, and has manufactures of stockings, tobacco, soap, sugar, woolen goods, etc. It is the seat of a government department, and is a lively, pleasantly situated town. The ancient fortifications, most of which are now converted into public walks, date from the time of Eric of Pomerania, who, in 1434, erected strong lines of defense on the seaside of the town, and built the castle, which still remains. Malmö was an important place of landing and embarkation as early as 1259, and through the middle ages it was extensively visited by German and other traders. In 1523 it was the scene of the signing of a treaty of peace between the Danes and Gustavus Vasa.

MALM'SEY (Malvasian wine; Fr. *vin de Malvoisie*), a name originally bestowed on the red and white wines of Napoli di Malvasia, in the Morea, and afterwards on similar wines produced in Cyprus, Candia, and other islands of the archipelago. Malmsey wines are of a luscious sweetness, and have a most peculiar bouquet. The Malmsey wines of commerce are mostly the produce of Teneriffe, the Madeiras, the Azores; the Lipari isles, Sardinia, Sicily, and Provence. Malmsey is made from grapes grown on rocky ground, fully exposed to the sun, and left to hang on the vines for a month longer than those used to make dry wines, by which time they are partially withered

MALONE', the capital of Franklin co., N.Y., on the Salmon river and the Ogdensburg and Lake Champlain railroad, midway between Ogdensburg and Rouse's Point. Pop., 7,186. It is the center of a prosperous agricultural district and of a large trade. It has well-established churches, excellent schools, two banks, and two newspapers.

MALONE, EDMOND, one of the most respectable editors of Shakespeare, was b. in Dublin, Oct. 4, 1741, and educated at the university of that city, where he won a high reputation as a scholar, and took the degree of B.A. In 1767 he was called to the Irish bar; but soon after, becoming possessed of a considerable fortune, he went to London, and devoted himself to literary pursuits. His first appearance as an author was in 1780, when he published 2 vols. supplementary to Steevens's edition of Shakespeare (1778). His next achievement—though in this he was only one of several—was exposing the splendid forgeries of Chatterton. He also contributed some notes to Steevens's third edition of Shakespeare, published in 1785, in which he occasionally controverted the opinions of the editor. This led to a serious quarrel between the two, in which Steevens was wholly to blame. Malone's own edition of the great dramatist (1790) was warmly received. The essays on the *History of the Stage*, and on the *Genuineness of the Three Plays of Henry VI.*, have been praised in an especial manner. In this work, Malone displays extreme good sense, much acuteness, extensive research, and a becoming respect for the text of the earlier editions. In 1796 he again signalized himself as a literary detective by exposing the Shakesperean forgeries of the Irelands. In 1797 he published a posthumus edition of the works of his friend sir Joshua Reynolds. His death took place May 25, 1812. He left behind him a large quantity of materials for another edition of Shakespeare, which appeared in 1821, in 21 vols., under the editorship of Mr. James Boswell. See *Life of Edmond Malone, with Selections from his Manuscript Anecdotes*, by sir James Prior (Lond. 1860)

MALPIGHI, MARCELLO, an eminent Italian anatomist, was born near Bologna in 1628, and died at Rome in 1694. He held, at different periods of his life, the professorship of

medicine in Bologna, Pisa, and Messina. In 1691 he was summoned to Rome, and appointed chief physician and chamberlain to pope Innocent XII.

He is now chiefly known for his discoveries in the anatomy of the skin, of the kidney, and of the spleen; and although the so-called *rete Malpighii* of the skin is no longer regarded as a special structure, the *Malpighian bodies* or *corpuscles* of the kidney and the spleen still retain the name of their discoverer. He is also remarkable as being the first who examined the circulation with the microscope, and thus discovered the blood corpuscles. Amongst his most important works may be mentioned *De Formatione Pulli in Ovo; De Cerebro; De Linguâ; De Externo Tactûs Organo; De Structurâ Viscerum; De Pulmonibus;* and *De Structurâ Glandularum Conglobatarum.* His *Opera Posthuma* were edited by Petrus Regis of Montpellier; they contain a history of his discoveries and controversies, together with numerous autobiographical details.

MALPIGHIA'CEÆ, a natural order of exogenous plants; trees, or shrubs, many of them climbing shrubs or lianas. They often exhibit an anomalous formation of the stem, great part of the woody matter being deposited in lobed zoneless ribs. The leaves are simple, generally with glands on the stalks or underside. The calyx is 5-partite, generally with very large glands; the corolla of 5 petals convolute in bud; the stamens generally 10, often monadelphous, a fleshy connective projecting beyond the anthers. There are about 600 known species, natives of tropical countries, and chiefly of South America, many of them having gaudy flowers. A few produce timber of a bright yellow color. The bark of some species of the genus *Byrsonima* is astringent and medicinal, and at one time attracted considerable attention as a remedy for pulmonary consumption. It is known as *alcornoque bark.* The fruit of some, as the BARBADOES CHERRY (q.v.), is pleasant.

MALPLAQUET, a village (pop. 400) in the department of Nord, France, 20 m. e. of Valenciennes, and close to the Belgian frontier, is celebrated for the bloody defeat of the French, under marshal Villars, by the British and Dutch, commanded by the duke of Marlborough and prince Eugene, Sept. 11, 1709. The forces engaged consisted of more than 200,000 men, the allies having a slight superiority in numbers; and the loss on each side amounted to about 20,000 men, the French losing also many standards and cannon. Marshal Villars was severely wounded early in the engagement, and the command devolved upon the old marshal de Boufflers, under whom the French, after great slaughter, retreated in good order. The result of the conflict was the capture of Mons.

MAL'STROM, or MOSKÖESTROM ("whirling stream"), the most famous whirlpool in the world, is situated on the Norwegian coast, between Moskŏe and Moskenäs, two of the Loffoden (q.v.) isles. The tremendous current that rushes between the Great West fjord and the outer ocean through the channels between the Loffoden isles creates many other dangerous currents, such as the Galström, Napström, etc.; but these are not to be compared with the famous Malström. The current runs for 6 hours from n. to s., and then 6 hours from s. to n., producing immense whirls. The depth of the water has been ascertained to be about 20 fathoms, while immediately to the w. of the straits the soundings are from 100 to 200 fathoms. The whirlpool is greatest at high or low water; and when the wind blows directly against the current, it becomes extremely dangerous, the whole sea for several miles around being so violently agitated that no boat can live in it for a moment. In ordinary circumstances it may be traversed even across the center without apprehension. The stories of ships, whales, etc., being swallowed up in the vortex are simply fables; at the same time there can be no doubt that a ship, once fairly under the influence of the current, would certainly either founder or be dashed upon the rocks, and whales have often been found stranded on the Flagstadt coast from the same cause.

MALT AND MALTING. See BEER.

MALTA, an island and British possession in the Mediterranean, 17 m. long by about 9 broad, with an area of about 115 sq.m.: it is of carbonaceous limestone, of the tertiary aqueous formation, and occupies a very central position in the Mediterranean sea, being distant some 54 m. from the Sicilian coast, and about 200 from cape Bon on the African coast. From its position, and also from the enormous strength of the fortifications, Malta is a possession of immense value to any commercial nation which possesses a navy strong enough to prevent it being blockaded. It happens, consequently, that Malta is one of the most important, after India, of the British dependencies, for it is not in any sense a colony. Possessing one of the most splendid harbors in the world, with such an even depth that the largest vessels may anchor alongside the very shore, the island forms at once an admirable station for a fleet to command the Mediterranean—a military focus, where a force protecting the route to Egypt and India can be concentrated—and a useful entrepôt for receiving the manufactures of Britain, which the small craft of the Mediterranean carry to every point on the shore of that inland sea and its tributaries. By whomsoever possessed, Malta has always been held in high estimation. Between it and Gozzo, or Gozo (q.v.), lies the small island of Comino; and off this last the still smaller islet, Cominotto, rears its rocky crest, while elsewhere round the shores of Malta and Gozo, a few rocks stud the sea, sustaining each a few fishermen, and affording herbage for goats on their moss-grown summits; among these are Filfla, with a

venerable church; Pietro Nero, or Black Rock; Scoglio Marfo, Salmonetta, and the *Hagira tal general*, or fungus rock, where grows the famed *fungus melitensis* (see CYNOMORIUM). Malta and Gozo, with their adjacent islets, form together a compact little realm, celebrated in history, possessing a magnificent capital in Valetta, and, from the fact that, owing to peculiar circumstances, vast contributions came to Malta from all Catholic Europe, adorned with public buildings, institutions, and works out of all proportion to its actual intrinsic importance.

In physical conformation, Malta is comparatively low, its highest point not exceeding 590 ft. above the sea-level. The surface is diversified by a succession of hill and dale, the land being intersected by parallel valleys, running from s.w. to n.e., the most considerable of which is the vale called Melleha. Across the island stretch the Benjemma hills or crags, and many spurs branch from them, which give a picturesqueness to the scenery. From the spongy nature of the limestone of which the island is composed, much of the rain falling in the wet season soaks in, and being evaporated through the thin alluvial covering by the heats of summer, keeps the ground moist, and gives it a fertility which could not otherwise be expected from so scanty and comparatively poor a soil. So thin, indeed, was the original surface-soil, that considerable quantities of earth were imported into Malta from Sicily. The productiveness of the soil must also be attributed to the quantity of carbonate of lime held in a minutely divided state above the entire face of the rock.

Malta shows no signs of volcanic formation; but the action of the sea among its cliffs has hollowed out grottoes and caverns in almost every direction, and some of considerable extent. The inhabitants are industrious, and good agriculturists, and every foot of the soil is diligently cultivated. On the whole, about the quantity of superior kinds of grain consumed is raised on the islands, and of inferior sorts a considerable amount is exported. Wine, resembling that of Spain, is produced; the sugar-cane is cultivated. The vegetable products comprise all that flourish in Italy, as aloes, oranges, and olives, with many plants of a more tropical growth. Malta was famed of old for roses. Salt and soda are manufactured; there are quarries of marble, alabaster, and building-stones. Mules and asses are remarkable in Malta for their strength and beauty, but horned cattle are small. Maltese goats are fine animals. The birds of Malta are renowned for their splendid plumage; and its bees produce an aromatic honey, excelled in no other locality.

Medina, the former capital of the island, now known as Citta Vecchia, or Notabile, is a handsome old town, lying inland; it contains the ancient palace of the grand masters of the order of St. John, the cathedral, a college, and is still the seat of the bishopric. Pop. 7,000. Its rival and successor is Valetta (q.v.). The numerous *casals* or villages scattered throughout Malta and Gozo are nearly built, and generally present an aspect of industry and frugal happiness.

It is thought by some that Malta was the *Hyperion* or *Ogygia* of Homer, but there is little doubt that the Phenicians colonized the island at a very early date, probably in the 16th c. B.C. Before they were dispossessed by the Greeks in 736 B.C., they had developed considerable commerce. The Greeks called the island *Melitas*, and were driven out by the Carthaginians about 500 B.C. As early as the first Punic war, it was plundered by the Romans, but did not come finally into their possession until 242 B.C. They valued it highly, on account of its use as a commercial entrepôt; and also for its cotton and linen cloths, fabrics then, as now, manufactured of wonderful fineness by the Maltese. The island remained under its old laws, governed by a proprætor, subject to the prætor of Sicily. On the n. coast is the port of St. Paul, and here tradition fixes the wreck of the ship carrying that apostle to Rome. On the division of the empire, Malta followed the fortunes of the eastern division. During the 5th c. it fell successively under the Vandals and Goths, whose barbarism nearly annihilated its commerce. In 533 Belisarius recovered Malta to the Byzantine empire, in nominal union with which it remained for more than three centuries; but its prosperity had departed, and its civilization almost vanished amid constant local feuds. In 870 the Arabs destroyed the Greek power in Malta, and fortified the harbor as a station for their corsairs. Count Roger, of Sicily, drove out the Arabs in 1090, and established a popular council for the government of the island, composed of nobles, clergy, and elected representatives of the people. This council, in a more or less modified form, subsisted for 700 years. Under a marriage-contract, Malta passed to the German emperor, who constituted it a marquisate, but it had ceased to be a place of trade, and was merely a garrison of more expense than value. Charles of Anjou, after overrunning Sicily, made himself master of Malta, which clung to the French even after they had been expelled from Sicily; but after a time the houses of Aragon and Castile successively held the island. Subsequently, the emperor Charles V. took possession of Malta, and, in 1530, granted it, with Gozo and Tripoli, in perpetual sovereignty to the knights of the order of St. John of Jerusalem, from whom the Turks had recently captured their great stronghold at Rhodes. The knights raised by degrees the stupendous fortifications which render Malta so powerful, and, moreover, spent their large income in beautifying the island in every way. Meanwhile, they rendered incessant services to Christendom in the chastisement of the ferocious Barbary pirates. To revenge these acts, the Turks brought immense forces against Malta in 1557, and again in 1565. The latter siege was carried on by the sultan Solyman himself, with the

flower of the Ottoman army; but the grand master La Valette opposed a heroic resistance, and he was forced to re-embark with the loss of more than 25,000 of his best troops. The defenders lost 260 knights and 7,000 Maltese soldiers; and their gallantry was the theme of admiration throughout the world. After this siege the knights built Valetta. In 1571 they, with the Maltese, behaved most courageously at the battle of Lepanto, where the Turks lost 30,000 men. Though waging perpetual war with the Moslem, the knights continued in possession of Malta until 1798, when overcome by Bonaparte's treachery, and disorganized by internal quarrels, the order surrendered their noble fortresses to the French. After pillage and infamous treatment by the republican forces, the Maltese rose in a few months against their oppressors, and after a siege of two years, British auxiliaries arriving, the French garrison of Valetta capitulated to the English gen. Pigot. The treaty of Amiens stipulated that Malta should be restored to the knights of St. John; but the Maltese loudly protested against such an arrangement, and preferred the peaceful government of Great Britain. The British government consequently refused to make the transfer, appreciating also, doubtless, the vast value of their new possession, and Napoleon made the refusal one of his grounds for the resumption of hostilities. The congress of Vienna recognized Malta as a British dependency, the condition in which it has since remained.

In 1874 Malta and Gozo, with the adjacent islands, together contained 145,599 inhabitants (including the British residents and foreigners, but excluding the military, who numbered 6,611). The population was increasing rapidly, but the annual rate of increase had declined from 1858. The upper classes speak Italian, but the real language of the people is a patois compounded from many sources, as must be expected from so checkered a history. Arabic, however, so far predominates that the Maltese find little difficulty in communicating with the Barbary peasants. It is alleged by some that the Maltese language—if its Italian and German elements were eliminated—would remain almost pure Punic, and would accurately represent the speech of Carthage at the time of its destruction. The religion of the people is strictly Roman Catholic, and, considering that the British flag waves over the island, but a scanty toleration is granted to other forms of faith. There are good provisions for education; a college at Valetta, where degrees are conferred in divinity, law, and physic; 65 public schools, with 8,324 pupils, besides 114 private places for education. There is also an excellent public library, free to all.

The commandant of the garrison is governor, and is aided in the civil government by a council of 16 members, of whom 8 are officials, and 8 are freely elected. The revenue amounted, in 1874, to £175,073, while the amount of the expenditure was £161,734. Customs and excise, with a few assessed taxes, provide the former; the latter is absorbed in the charges of the civil government, and in a contribution of £6,200 towards the military expenditure. On the other hand, Great Britain maintains a considerable force in the islands, mainly for imperial purposes, at a cost of about £370,000 a year. Besides a large body of British artillery, the garrison includes the royal Malta fencible artillery, a fine native regiment of 639 officers and men. There is an extensive arsenal, and a very important dock-yard, Malta being the headquarters of the British fleet in the Mediterranean. Taken altogether, Malta is a possession the British highly value; it is nearly, if not quite, as strong as Gibraltar, and far more useful.

The public debt amounted, in 1875, to £268,248, at a very low rate of interest. In 1875 the vessels which entered and cleared the port, exclusive of the coasting-trade and steamers, had a total tonnage of 4,832,000 tons. Of this total about 4,000,000 tons are set down as representing British vessels. In the same year, the total value of the imports amounted to £10,325,000; while the exports were estimated at a total of £9,500,000—corn *en route* from Russia for the United Kingdom figuring very largely in the transactions.

MALTA, KNIGHTS OF. See JOHN, ST., OF JERUSALEM, KNIGHTS OF.

MALTEBRUN, KONRAD (properly, MALTHE BRUUN), an eminent geographer, b. Aug. 12, 1775, at Thisted, in Jutland, studied in Copenhagen, and at the outbreak of the French revolution, embraced with great ardor the liberal cause, so that being prosecuted upon account of political publications, he was twice obliged to flee from Denmark, and finally, in 1800, was condemned to perpetual banishment from his native country. He sought refuge in Paris, where he maintained himself by teaching and literary labors. In 1808 he began the *Annales des Voyages, de la Géographie et de l'Histoire* (24 vols.), which he concluded in 1814. In 1818 he began, along with Cyries, the *Nouvelles Annales*, etc. He devoted his pen to the support of Napoleon during his reign; and in 1815 became connected with an ultra-royalist journal, and a defender of the theory of legitimacy adopted by the congress of Vienna. His principal work is his *Précis de la Géographie Universelle* (8 vols. Par. 1824–28, with an atlas). He took part also in the *Dictionnaire Géographique Universelle* (8 vols. Par. 1821), and was secretary to the geographical society of Paris. He died Dec. 14, 1826.—His son, VICTOR ADOLPE MALTEBRUN (b. 1816), is one of the most eminent living geographers of France, and has succeeded his father as secretary of the geographical society of Paris.

MALTESE' CROSS, a cross of eight points, of the form worn as a decoration by the hospitalers (q.v.) and other orders of knighthood.

MALTESE DOG, a small kind of spaniel, with roundish muzzle, and long, silky, generally white hair. It is altogether useless, and fit only for a lapdog; but is a very ancient breed, being figured on Roman monuments, and noticed by Strabo.

MALTHA, a Greek name meaning soft wax, originally applied to a mineral fat from Kirwan, having a resemblance to wax, probably composed of paraffine; but now applied to certain kinds of bitumen, mineral tar, or asphalt. It differs but little from the semi-solid varieties of asphalt, although it is described as frothing more on boiling. Some specimens are said to contain a small portion of oxygen, and also nitrogen, but these are probably the traces of impurities, as well as the cause of the frothing. No satisfactory analysis has been made. See ASPHALT; BITUMEN; DEAD SEA; *ante.*

MALTHUS, THOMAS ROBERT, the founder of those opinions concerning the relation of population to the means of sustenance which have been named after him "Malthusian," was b. in the county of Surrey, in the year 1766. He was well connected, and graduated with honors in 1788, at Jesus college, Cambridge, of which he became a fellow. He became soon after clergyman of a small parish in his native county, and divided his time between his cure and the university libraries. In 1799 he left Britain to see foreign countries, along with the eminent traveler, Daniel Clarke. The great European war was then raging, and the most interesting portions of the continent of Europe were closed to our countrymen. Malthus, however, with an evidently keen anxiety to observe mankind under a variety of conditions, wandered through Sweden, Norway, Finland, and part of Russia, making notes of what he observed. Next year he took advantage of the short peace of Amiens to visit France and other portions of central Europe. These efforts to become acquainted with mankind are significant since. Although Malthus has the reputation of being a bold theorist, the charm of his writings consists in his practical knowledge of how men have existed and acted in various parts of the world and under diverse conditions; and his knowledge of actual human nature—his sagacity and accuracy, in short, in the details which he brought to bear on his great theory—were in a considerable measure the source of the great influence exercised by him over public opinion, and had the secondary effect of making his books readable even to those who made war on his conclusions. It was in 1798 that he first published his *Essay on the Principles of Population as it affects the Future Improvement of Society;* but in subsequent editions he so greatly enlarged and enriched the work, that it could hardly be identified with the first impression. The predominant idea of the book was evidently suggested by Hume's essay on the populousness of ancient nations, in which vague statements as to the vast multitudes of human beings subsisting in any place, or wandering from place to place, are brought to the test of the means of subsistence at their disposal. Where there is an accurate census, the number of people living on the portion of the globe covered by it is, of course, known to within a trifle of the truth. Such arrangements for accuracy have, however, been extremely rare in the history of the world. Where they are absent, egregious exaggerations have been made in estimates of the numbers of mankind; and in the absence of absolute facts, the best means of reducing these wild estimates to something reasonable was the skeptical philosopher's plan of comparing the estimate of the numbers with the probable amount of food at their disposal. The application of this check by Malthus was something like the application of chemistry to organic matter. He set himself to finding out how the relation of population to the means of sustenance could affect the future of the world. The result was appalling. The human race was found to increase at something like geometrical progression; while the fertility of land, by bringing in waste, and improving the methods of agriculture, only increased in something like an arithmetical proportion. Hence, if population were permitted to increase at its natural rate, it would soon overtake the means of subsistence. The theory had only one defect as applicable to the present condition of the world, that it overlooked the element of free trade. It involved a general pauperism to Britain if her people had no resource but the produce of her soil, but it made no allowance for the capacity of Britain to draw upon the fertility of the world at large. Malthus wrote other books, which got little notice in their day, and have been forgotten. He was appointed professor of political economy at the college of Haileybury in 1805. He filled his chair with great repute until his death, Dec. 29, 1836.

MAL'TON, a parliamentary borough and market t. in the North Riding of Yorkshire, on an elevation on the right bank of the Derwent, 18 m. n.e. of York. The parliamentary borough includes the parishes of Old Malton and Norton, to the former of which a grammar-school, founded in 1547, and having an annual endowment of £100 a year, is attached. There are also the remains of a priory, founded in 1150. Considerable trade is carried on. Pop. '71 of borough, which, since '67, returns but one member to parliament, 8,168.

Malton, called by the Romans *Camulodunum*, abbreviated by the Saxons into *Meldun*, was an important Roman military station, to which six ancient roads lead. After having been burned down, the town was rebuilt in the reign of Stephen, since which time it has been generally called New Malton.

MALT REFUSE, or MALT WASTE, is of two kinds: (1.) the *cornings* or small shoots and radicles of the germinated grain, which are separated before the malt is used by the brewer, often called *malt dust* and *kiln dust;* and (2.) the exhausted malt, after it has been

used by the brewer, called *draff*. Both are of use for the feeding of cattle, but the first kind is the most nutritious, being rich in nitrogenous substances which the brewer extracts from the malt used by him; draff, however, is advantageously employed, along with turnips, for the feeding of dairy cattle. Malt dust is also used as manure, chiefly as a top-dressing, and is very fertilizing and rapid in its effect.

MALU'RUS, a genus of Australian birds, giving its name to a large subdivision of the family *sylviadæ*, in which are contained many Asiatic and African species, and some that are natives of the s. of Europe. They have generally a long tail; in some, very long, as in the EMEU WREN of Australia, in which it is more than twice the length of the body, the shafts of its feathers loosely fringed on each side. The emeu wren (*stipiturus malachurus*) is a very pretty little bird, living chiefly among long grass. One of the most noted *maluri* is *M. cyaneus*, the BLUE WREN or SUPERB WARBLER of Australia, which is gorgeously attired in black, blue, white, and brown. It haunts scrubby brushwood.

MALUS, ETIENNE LOUIS, 1775–1812, b. Paris; educated at the school of military engineers, but falling under the suspicion of the revolutionary government, was dismissed. While serving as a private soldier at Dunkirk, he attracted the attention of Lepère, director of the fortifications there, who procured him an appointment to the *École Polytechnique*. Here he pursued the study of mathematics, and especially of the mathematical theory of optics. Appointed to the engineers, he entered the army of the Sambre and Meuse, and witnessed the passage of the Rhine, and the engagements at Altenkirch and Ukratz. He was attached to the Egyptian expedition, and after the capture of Jaffa, was engaged in the restoration of its fortifications, and the construction of military hospitals. He fortified Damietta, was present at the siege of Cairo, and after the surrender to the English, came back to France in 1801. He now took charge of the fortifications at Antwerp and Strasburg, at the same time carrying on his scientific researches. His *Traité d'Optique*, published in 1810, treats of the refraction and reflection of light, and contains experiments in regard to the reflection of light in transparent media. In 1808 the French institute offered a prize for the best paper on double refraction in crystals. Malus competed for this prize, and in the course of his experiments discovered the phenomenon known as the polarization of light. He advanced the theory that particles of light have poles, and that on entering a doubly-refracting crystal, some of the particles forming one of the rays may be so arranged as to be transmitted through it, while the particles which should have formed the other ray may be so arranged as to prevent the transmission in certain directions. The discovery of these phenomena introduced a new division of physical optics. Malus published an account of them in the *Memoirs* of the institute, which at once elected him to its membership; and the English royal society gave him the Rumford medal, though France and England were then at war. In 1810 he published his *Théorie de la Double Refraction de la Lumière dans les Substances Cristallisées*, and the next year he wrote a couple of papers on some phenomena of polarized light. He was appointed examiner in physics at the *École Polytechnique*, and was about to be appointed director of its studies when he died.

MALVA'CEÆ, a natural order of exogenous plants, of which about 1000 species are known, chiefly tropical, and most abundant in America, although the most important species belong to the old world. They are herbaceous plants, shrubs, and occasionally in tropical countries trees; with alternate entire or lobed leaves; the pubescence, if any, starry; the flowers showy, generally on axillary stalks; the calyx generally of five sepals or five segments, often with an epicalyx; the petals generally five, hypogynous, twisted in bud; the stamens numerous, united by their filaments; the ovary consisting of a number of carpels around a common axis, the styles generally five, the ovules few or many; the fruit dry or fleshy. The plants of this order have a great general similarity both in their appearance and in their properties and products. All of them contain a mucilaginous substance in great quantity, which is particularly abundant in the roots of the perennial herbaceous species. This mucilaginous quality makes some very useful as emollients and demulcents in medicine. The young foliage of some is used as a boiled vegetable. The seeds of all contain a considerable quantity of bland fixed oil. The inner bark of the stem often yields a useful fiber, for which species of *hibiscus* and *sida* are particularly valued; and to this order belong the cotton plants, so valuable for the fiber which envelops their seeds. Many of them are frequent ornaments of flower-gardens. See COTTON, HIBISCUS, HOLLYHOCK, MALLOW, MARSH-MALLOW, SIDA, and URENA.

MALVERN, GREAT, a t. and watering-place in Worcestershire, Eng., picturesquely situated on the eastern side of the Malvern hills, 8 m. s.w. of Worcester. The purity and abundance of the spring-water, and the facilities for healthful exercise afforded by the hills, have rendered Malvern a great resort for invalids following the hydropathic treatment, for which there are several large establishments. Pop. '71, 5,693.

MALVERN HILL, BATTLE OF, the last of the engagements known as the "seven days' battles," June 26–July 1, 1862, the others being those of Mechanicsville, Cold Harbor, Savage's station, and Frazier's farm. After the battle of Frazier's farm, McClellan posted the union army on Malvern hill, an elevated plateau about 1 m. from the James river, and 11 m. from Richmond. This hill is about a mile and a half in

length and three-quarters of a mile broad, flanked by thick woods, and faced with gullies, which rendered it exceedingly difficult of approach. The ground was thus exceptionally strong by nature, and it was now defended by McClellan's army of about 90,000 men; a battery of 7 heavy siege guns was placed on the crest of the hill, and the remainder of the union artillery was admirably posted in such wise that the concentrated fire of 60 guns could be directed at any point desired. Lee's army, which had persistently followed McClellan on his retreat to the James, attacking whenever it seemed practicable, had met with a serious repulse, June 30, but on the morning of July 1, with about 60,000 men, undertook to storm Malvern hill in the face of all the obstacles presented. The confederate attack was made by Jackson and D. H. Hill, and supported by Magruder, and, as might have been anticipated, resulted in their repulse, with a loss of 900 killed and 3,500 wounded. The union loss was 375 killed and 1800 wounded. McClellan did not take advantage of this success, but retired at once to Harrison's landing. The confederates continued to hold their lines for several days, when they retired to Richmond. See CHICKAHOMINY.

MALVOISINE, or MAWMOISINE, WILLIAM DE, a Scottish ecclesiastic; was educated (and as some think, born) in France. Going to Scotland, he was made one of the *clerici regis*, and archdeacon of St. Andrews. In 1199 he was constituted chancellor of Scotland; in 1200, bishop of Glasgow; in 1202, of St. Andrews; in 1208 he dedicated the new cemetery at Dryburgh abbey; in 1211 he and Walter, bishop of Glasgow, by appointment of the pope, convened at Perth a great council of the clergy and people, to press upon the nation the pope's will and command that an expedition be undertaken to Palestine. In 1214 he attended the coronation of king Alexander II., and is said to have placed the crown on his head. The following year he went with the bishops of Glasgow and Moray, and Henri, abbot of Kilso, to the fourth Lateran council, remaining abroad until 1218. He brought from the continent various orders of monks and mendicants before unknown in Scotland, and established convents of black friars at several places. He wrote lives of the saints Ninian and Kentigern. He was exceedingly zealous for the church. He insisted earnestly also on his own rights, for at one time he deprived the abbey of Dunfermline of the presentation to two churches, because the monks had failed to provide him wine for supper. Fordun says the monks had provided wine, but that the bishop's attendants had drunk it all up. He continued bishop of St. Andrews till his death.

MAL'WA, a former kingdom of India, lying for the most part n. of the Nerbudda, and s.w. of the valley of the Ganges, is an uneven plateau varying from 1500 to 2,500 ft. above sea level. It is now divided into a number of protected states.

MAME, ALFRED HENRY ARMAND, b. Tours, France, 1811. Inheriting the publishing house of his father, of which he has become sole conductor; he has increased it to a vast establishment, employing 700 workmen in its factories, and nearly as many more outside, printing and binding upwards of 20,000 volumes per day. Religious books formerly composed a large part of its work, but works on law have been added. The *Bibliotheque de la Jeunesse Crétienne*, an aggregate of little volumes for distribution in Sunday and secular schools, and primary school-books make the greater part of the publication of the house of Mame. Of late years, however, they have published elegantly illustrated works in other fields; as, *Les Jardins; La Sainte Bible*, illustrated by Doré; and *Les Chefs d'Œuvre de la Langue Française*. In 1773 he received one of the prizes of 10,000 francs accorded to the manufacturing establishments where there was found the greatest social harmony and well-being among the workmen, which was given for his establishment at Tours.

MAM'ELON (Fr. from Lat. *mamma*, breast), a mound in the shape of a woman's breast. These artificial mounds of fortifications were common in the siege of Sebastopol.

MAMELU'CO, the name given in parts of South America to a child of a negro father and an Indian mother.

MAM'ELUKES, MAMLOUKS, or MEMLOOKS, an Arabic word signifying *slaves*, the name given in Egypt to the slaves of the beys, brought from the Caucasus, and who formed their armed force. When Genghis Khan desolated great part of Asia in the 13th c., and carried away a multitude of the inhabitants for slaves, the sultan of Egypt bought 12,000 of them, partly Mingrelians and Tcherkesses, but mostly Turks, and formed them into a body of troops. But they soon found their own power so great that, in 1254, they made one of their own number sultan of Egypt, founding the dynasty of the Baharites, which gave place to another Mameluke dynasty, that of the Borjites, in 1382. The Causasian element predominated in the first dynasty, the Tartar element in the second. In general, they formed able and energetic rulers, and Egypt under their sway arrived at a degree of prosperity and power to which she had been a stranger from the days of Sesostris. Selim I., who overthrew the Mameluke kingdom in 1517, was compelled to permit the continuance of the 24 Mameluke beys as governors of the provinces. This arrangement subsisted till the middle of the 18th c., when the number and wealth of the Mamelukes gave them such a preponderance of power in Egypt that the pasha named by the porte was reduced to a merely nominal ruler. The number of them scattered throughout all Egypt was between 10,000 and 12,000 men. Their number was kept up chiefly by slaves brought from the Caucasus, from among whom the beys and other officers of state were exclusively chosen.

Their last brilliant achievements were on the occasion of the French invasion of Egypt, and during the time immediately following the retirement of the French. At this time Murad Bey stood at their head. But in 1811 they were foully massacred by Mohammed Ali (q.v.), afterwards viceroy of Egypt.

MAMERS, a small t. of France, in the department of Sarthe, 25 m. n.n.e. of Le Mans. Coarse linens, calico, beer, and leather are manufactured. Pop. '72, 5,063.

MAMIANI, Count TERENZIO, an Italian philosopher, statesman, and writer, b. in 1801, at Pesaro. Having taken a prominent part in the futile revolutionary outbreak which accompanied the accession of Gregory XVI., Mamiani was compelled to seek safety in flight, and repaired to Paris, from whence he promoted with energy the revolutionary tendencies of his country. In 1846, on the accession of Pius IX., he declined the proffered papal amnesty, as long as its acceptance involved a disavowal of his former political principles; but on its being unconditionally granted, he availed himself of it, and even formed part of the papal ministry on the promulgation of the constitution. The inconsistent policy of the pope having compelled him to resign his post, he withdrew to Turin, where he founded, with Gioberti, a society for promoting the union of Italians. On the flight of Pius IX. from Rome to Gaeta, he re-entered the political arena, and was for a short period foreign minister in the revolutionary cabinet of Galetti. On the fall of Rome he retired to Genoa; in 1856 he was returned member of the Sardinian parliament, and in 1860 entered Cavour's ministry as minister of instruction. He was appointed ambassador to Greece in 1861, to Switzerland in 1865. His chief works are: *Del Rinnovamento della Filosofia antica Italiana* (1836); *Poeti dell' età Media* (1842); *Dell' Ontologia e del Metodo; Principi della Filosofia del Diritto*, and a number of treatises on various subjects. In 1870 he became editor of a new quarterly review, *Filosofia delle Scuole Italiane*.

MAMMA'LIA (Lat. *mamma*, the breast), the highest class of the animal sub-kingdom *vertebrata* (q.v.). This class includes man and all the animals which resemble him in the most important points of their organization; and it is naturally placed at the head of the animal kingdom because (independently of man being a member of it) it contains the animals which manifest the highest degree of intelligence, and which possess the most complex organization.

The most distinctive character of the mammalia is their mode of development and of nourishment during the earliest period of life. They are all brought into the world alive (viviparous), not merely, as in certain (ovo-viviparous) reptiles and fishes, by the retention and hatching of the egg within the oviduct, but by the formation of a new connection between the embryo and its mother, while the former lies within the maternal cavities, so that provision is made for its development before birth, not, as in birds, etc., by the large yelk (see DEVELOPMENT OF THE EMBRYO), but by a constant supply of nutriment direct from the maternal blood. In mammals, the ovum on quitting the ovary is of extremely minute size, and the materials of the yelk only serve to support the embryo during its very earliest period. After undergoing certain changes in the passage through the Fallopian tube or oviduct, which it is unnecessary here to notice, the ovum reaches the uterus or womb, and connects itself by a set of root-like tufts of vessels with the maternal vessels. These tufts absorb from the mother's blood the ingredients necessary for the support of the embryo, while they convey back to it the effete particles of the embryonic tissues. Through this organ, which simultaneously increases in size with the embryo, and is named the placenta, the young animal, except in the lowest orders of the class—viz., the marsupialia (q.v.) and the monotremata (q.v.)—derives its nutriment during the whole period of gestation (q.v.); while in the two orders just named no vascular connection of the ovum with the uterus of the mother is formed, the ovum being simply retained for a time within the uterus, and the requisite nourishment for the development of the young animal being obtained by absorption through the membranes of the ovum. This remarkable difference in the development of the mammalian embryo has given rise to a division of this class into two great sections or sub-classes—the *placental* and the *implacental* (or *aplacental*) mammals. In both sub-classes we find the same provision for nourishing the animal during the period immediately succeeding its birth—viz., the milk (q.v.), a fluid secreted by peculiar glands, called the *mammary glands*, which become greatly developed in the female during the periods of gestation and lactation; and as this is found in no other class, it is the character by which the entire group is most positively defined, and from which it derives its name.

The mammary gland exists in both sexes, but except in very rare cases, it is only in the female that they secrete milk. Their number is never less than two, and when more, is generally nearly proportional to that of the young produced at each birth. In the monkey, the elephant, the goat, the mare, etc., there are two; in the cow, stag, and lion, four; in the cat, eight; in the rabbit, ten; in the pig, generally twelve; and in the rat ten or twelve. These glands are often blended together, as in the cow; and their number is then indicated externally by that of the nipples or teats. Their position also varies; in the monkeys and bats, and in the herbivorous cetacea, they are situated on the thorax, as in man; in most of the carnivorous animals they are situated on the abdomen as well as on the thorax; while in the mare, cow, sheep, etc., they are placed still further back, near the hip-joint.

The *skin* in the greater number of mammalia is covered with hair, a form of tegumentary appendage peculiarly characteristic of this class. In the cetacea, however, we have an almost entire absence of hair; one of its uses—that of keeping the heat within the body—being here provided for by the thickening of the skin and the deposition of the blubber beneath it. In the edentata, the hairy covering is almost entirely replaced by horny scales, as in the scaly ant-eater, or by bony plates, as in the armadillo. In the quills of the porcupine and the spiny bristles of the hedgehog, we have other modifications of hair which depart less from its ordinary character than those just mentioned. Moreover, the claws, nails, and hoofs of all mammals, the horn or horns on the nose of the rhinoceros, and the horns of the hollow-horned ruminants (such as the ox, sheep, etc.), are all composed of a substance which is only a modification of hair.

The *skeleton*, as a general rule, governs the general form of the body. In its general conformation, it shows a close analogy with that of man, which is described in the article SKELETON; the differences which are remarked among the various animals of this class mainly depending (1) upon the absence of posterior limbs in the marine mammals, such as the dugong, the porpoise, and the whale; (2) upon the diminished number of digits (see HAND and FOOT), and upon the absence of the clavicle in the greater number of those species whose anterior limbs serve only for motion; (3) upon variations in the number of vertebræ; and (4) upon the inequalities in the relative sizes of the same bones (Milne-Edwards).

Although the same bones enter into the formation of every mammalian skull, great differences present themselves in different skulls, according as the face is more or less prolonged, or, on the other hand, the brain-case or cranium is more or less developed. In proportion as a mammal is removed in classification from man, we find that the cranium is diminished; that the face is prolonged by extension of the jaws and nasal cavities; that the orbits are directed outwards, and are less distinct from the temporal fossæ; and that the occipital foramen (through which the spinal cord passes) and the condyles (by which the head articulates with the first vertebra of the spinal column) are placed towards the posterior part of the skull, instead of occupying the middle of its inferior surface, as in man. Among the most characteristic points in the mammalian skull generally may be mentioned (1) that the lower jaw articulates directly with the skull, there being no intervening tympanic bone, such as occurs in the other vertebrates; and (2) that the occipital bone of the skull articulates with the first vertebra by two condyles, one on either side of the occipital foramen, instead of by a single condyle, as in the other vertebrates.

The *vertebral column*, except in relation to its length, closely resembles that in man, where there are 7 cervical, 12 dorsal, 5 lumbar, 5 sacral, and 5 caudal vertebræ. The *cervical vertebræ* are almost universally 7 in number, however long or short the neck may be, the only known exceptions being two cetaceans (*manetus* and *rytina*), which have 6, and the three-toed sloth, which has 9. The number of *dorsal vertebræ* ranges from 11 to 23, which latter number occurs in the two-toed sloth. The *lumbar vertebræ* range from 2 to 9, the most common number being 5. The *sacral vertebræ*, which coalesce to form the sacrum and to support the pelvic arch, vary from 2 (in the monotremata and marsupialia) to 6 (in the mole), the most common number being 4. In the cetacea, the rudimentary pelvis is loosely connected with a single vertebra, and there cannot be said to be a sacrum. The *caudal vertebræ*, which in man and the higher apes coalesce to form the *coccyx*, are usually very numerous, 20 or 30 being a common number, and 40 occurring in the long-tailed ant-eater. The form and number of *caudal vertebræ* vary in accordance with the purposes to which the tail is applied; and the special uses of this organ are numerous. For example, in the kangaroo it serves as a third leg when the animal stands erect; in the American monkeys, and in some of the opossums, it is a prehensible organ; and in the cetacea and in the beaver it is a powerful instrument of propulsion in water. The *ribs* correspond in number to the dorsal vertebræ, and, as a general rule (excepting in the monotremata), they are connected superiorly not only with the bodies of two vertebræ, but with the transverse process of one of them, and hence present corresponding articular surfaces. The *sternum* is generally divided into three portions; the middle one, in place of being represented by a single piece, as in man, usually consisting of as many pieces as there are true ribs. It is very short in the cetacea, and is very long in the carnivora and edentata, extending in some cases nearly to the pelvis. In certain cases, in which it is necessary that the anterior members should be endowed with unusual strength, as in the bats, moles, and armadillos, there is a projecting keel upon this bone (as in birds) for the attachment of powerful pectoral muscles.

The cavity of the *thorax*, which is bounded superiorly by the dorsal vertebræ, laterally by the ribs, and inferiorly by the sternum, is completely separated from the abdominal cavity in mammals (but in no other vertebrates) by the muscular septum known as the *diaphragm*, or midriff.

The *scapular arch* in mammals is comparatively imperfect, its coracoid element (see CORACOID BONES) not being sufficiently developed, except in the monotremata, to reach the sternum, or to meet its fellow in the mesian line. Where the scapula has any bony connection with the sternum, it is through the clavicle or collar-bone, which is frequently absent. The *pelvic arch* is always composed of the ilium, ischium, and pubis on either

side, and these bones generally coalesce together, as in man, at an early period of life; but in the monotremata they remain separate. In the implacental mammals (the monotremata and marsupialia), the pelvis presents this striking peculiarity, viz., that from the symphysis (or mesial line of union) two additional bones, termed the marsupial bones, project forwards and outwards, one of whose functions is to support the *marsupium*, or pouch, which is characteristic of the female marsupials. In the bat, the pelvis is greatly elongated, and the bones do not unite in the mesial line to form a symphysis, so that the lower part remains open, as in birds; while in the cetacea, which have no posterior limbs to be supported by the pelvis, that organ is extremely rudimentary or even entirely absent. As a general rule, the pelvis of mammals is never so broad as in the human subject, and its lateral walls are always relatively smaller, flatter, and longer.

The *anterior extremities* are always present, although their modes of conformation are very varied, according to the purposes for which they are designed; and the *posterior extremities*, which are also always present, except in the cetacea, closely resemble the anterior; the difference being greater in man than in any other case, in consequence of the special adaptation of the pelvic extremities for the support of his body in an erect position. The ordinary modifications of these organs are described in the articles HAND and FOOT.—See Owen *On the Nature of Limbs*.

The *teeth* of mammals constitute so characteristic a feature in their organization, and are of so much service in their classification, as to require a special notice. The only animals of this class in which teeth are altogether absent are the true ant-eaters and the monotremata. The number of teeth is generally much more restricted than in reptiles or fishes. In most mammals it is the same as in man—viz., 32; but the typical number, according to Owen, is 44. The largest number of teeth occurs in the armadillos (in one species of which are 98 simple molars), and in the dolphins, which have from 100 to 190 teeth. When the teeth are in these excessive numbers, they are small, nearly equal, and usually of a simple conical form, but excepting in these cases, most mammals have particular teeth for special purposes; thus, the front teeth, from being commonly adapted to effect the first coarse division of the food, are called cutters, or *incisors;* and the back teeth, which complete its comminution, grinders, or *molars;* while the large conical-pointed teeth (of which there is never more than one in each half jaw), which are specially adapted for holding the food while the animal tears it asunder, are called holders, laniaries, or more commonly *canines*, from being well developed in the dog. The incisors and canines may be absent, but except in the cases previously mentioned, the molars are always present. The mode in which the teeth are implanted in the jaw is characteristic of the class. Excepting in those teeth which grow from persistent pulps (as the front teeth of the rodents, for example), the dental cavity is closed in at its extremity, and the tooth is prolonged into a fang, which is implanted in a socket lined by periosteum, to which the exterior of the fang is firmly adherent; there being never a continuous ossification or anchylosis of the tooth to the jaw. Again, the fang of the molars is usually divided into two, three, or even four divergent processes, and there is no known fish or reptile in which even a bifid fang occurs. Teeth are confined in this class to the maxillary, pre-maxillary, and lower maxillary bones, and form only a single row in each; and, in general, teeth are situated in all these bones. In all existing mammals, except man, there is a vacant space between the incisor and canine teeth. No mammal has more than two sets of teeth; most, however, have two; the first, which are called temporary, deciduous, or milk teeth, being displaced, and succeeded by the permanent teeth. For a description of the structure and principal forms of these organs, we must refer to the article TEETH, and to prof. Owen's magnificent *Odontography*.

The *digestive apparatus* (of which the teeth may be considered a portion) acquires its greatest completeness and elaboration in this group. The leading differences which it presents, and which depend mainly on the nature of the food, have been already noticed in the article DIGESTION.

The *organs of circulation and respiration* require no special remark, as, in all essential points, they closely resemble the corresponding organs in man. See CIRCULATION and RESPIRATION.

The *kidneys* of mammals generally agree with those of man in their internal structure. See KIDNEYS. In some animals (especially those that live in water), they are much lobulated. In the ox, there are 20 free rounded lobules; in the bear, 40 or 50; in the seal, 70 or 100; while in the true cetacea, the separate lobules are so numerous as to give a racemiform appearance to the kidney. All mammals are provided with a urinary *bladder*, in which the excretion may accumulate so as only to require being discharged at intervals. This organ is largest in the herbivora, and very small in the cetacea.

The *nervous system* is remarkable for the large size of the brain, and especially of its hemispheres, in comparison with the rest of the nervous system. The surface of the cerebral hemispheres exhibits a more or less convoluted appearance, the number of the convolutions being to a great degree in correspondence with the amount of intelligence of the animal. The hemispheres are united at their lower parts (except in the implacental mammals) by a fibrous band or commissure, termed the *corpus callosum*, which does not occur in the other vertebrates. In the lowest mammals, the cerebellum is situated quite behind the hemispheres, so as to be visible from above; as we get higher in the scale, it is more

or less covered, in consequence of the prolongation of the hemispheres backwards; until in the highest apes and in man it is almost completely concealed.

The *organs of the senses* are constructed on precisely the same plan as in man. The most important variations are noticed in the articles EAR, EYE, etc.

The *muscular system* generally accords with that of man, but presents many remarkable deviations, according to the form of the skeleton, the use of the several organs in the act of locomotion, the natural posture of the animal, etc.

From the structural characteristics and peculiarities of mammals, we turn to that class of animals in their relations to man.

The *uses* to which mammals are subservient are almost innumerable, and will readily suggest themselves.

Mammals are very generally distributed over the surface of the globe. The mammalia of certain regions evince very decided peculiarities of structure and distribution, as is well exemplified by the case of the two lowest or *implacental* orders—the *monotremata* and *marsupialia*, both of which (with the sole exception of the opossum, one of the *marsupialia*, in America) are confined to the Australian province. Many other facts of equal interest in the distribution of mammals will be readily ascertained in Mr. A. R. Wallace's *Geographical Distribution* (1876).

The subdivision of the mammals into these orders closely approximates to that of Cuvier, as may be seen by a reference to the following table of his sub-classes and orders of the mammalia:

		Order.	Family or Genus.	Example.
UNGUICULATA,	With three kinds of teeth,	BIMANA,	*Homo*,	Man.
		QUADRUMANA,	*Catarrhina*,	Ape.
			Platyrrhina,	Marmoset.
			Strepsirrhina,	Lemur.
		CARNARIA (the CARNASSIERS of Cuvier,	*Cheiroptera*,	Bat.
			Insectivora,	Hedgehog.
				Shrew.
				Mole.
			Carnivora,	Bear.
				Dog.
				Seal.
		MARSUPIALIA,	*Didephys*,	Opossum.
			Phalangista,	Phalanger.
			Macropus,	Kangaroo.
			Phascolomys,	Wombat.
	Without canines,	RODENTIA,	*Claviculata*,	Rat.
			Non-claviculata,	Hare.
	Without incisors,	EDENTATA,	*Bradypus*,	Sloth.
			Dasypus,	Armadillo.
			Myrmecophaga,	Ant-eater.
			Monotremata,	Echidna.
				Ornithorhynchus.
UNGULATA,		PACHYDERMATA,	*Proboscidea*,	Elephant.
			Ordinaria,	Hog.
				Tapir.
			Solidungula,	Horse.
		RUMINANTIA,		Sheep.
MUTILATA,		CETACEA,	*Herbivora*,	Dugong.
			Ordinaria,	Whale.

This classification is given in the present article because, although imperfect in many respects (for example, in placing the sloth above the horse, the bat above the dog, and the hedgehog above the elephant), it has been retained in a large number of popular works. In consequence of these obvious imperfections, subsequent attempts at new classifications have been made by several of the most eminent zoologists, some of whom, as Waterhouse and Owen, have taken the brain, and others, as Milne-Edwards, Gervais, and Vogt, the placenta, as the basis of classification. Our limited space forbids us from discussing the merits of these systems. The grounds on which prof. Owen bases his cerebral classification may be found in his essay *On the Classification and Geographical Distribution of the Mammalia*, 1859; while the arguments in favor of the placental classification may be found in prof. Huxley's lectures on classification, published in the *Medical Times* for the year 1863.

Fossil Mammalia.—The remains of mammalia are generally found in a fragmentary condition; but there is a valuable compensation to the student of these higher organisms, for in them the parts are so differentiated that the smallest fragment—a tooth or a bone—often tells more to the comparative anatomist than the complete skeleton of some of the lower classes.

No relics of mammalia have been detected in the palæozoic rocks, the earliest we are acquainted with belong to secondary strata. These are the remains of *microlestes* from the Keuper, unless the jaws of the *dramatherium* from an American coal-bed, which is probably of triassic age, be older. The *microlestes*, of which the teeth only have been found in Germany and in Somerset, is considered by Owen to have been allied to the small marsupial and insectivorous *myrmecobius* of Australia. The next remains of this class have been found in the Stonesfield slate, a member of the oolite. They consist of teeth and lower jaws, which have been referred to four genera, three of which are thought to have been marsupial insectivora, while the other (*stereognathus*) was a placental mammal, probably a hoofed, and consequently a herbivorous animal, allied to the eocene

hyracotherium. Mr. Beckles has recently found the remains of twelve or thirteen species belonging to eight or nine genera of mammalia—placental and marsupial—in the Purbeck beds, the newest of the oolites. The great series of the chalk formations has hitherto yielded no mammalian fossils. We are certainly acquainted with only a small fraction of the mammals of the secondary measures. When more continued and careful research is made, greater results must follow. Mr. Beckles recently uncovered 22 yards square of the very thin dirt-bed of the Purbeck, from which previously the remains of only a single species had been obtained, and this very limited space yielded up to him the remains of no less than twelve or thirteen new species.

As we rise through the tertiary deposits, the number of mammalia greatly increase. Nearly 50 species were described by Cuvier from the eocene strata of the Paris basin; and since his time, numerous additions have been made by Owen and others. They are chiefly pachyderms, belonging to the genera *palæotherium, anoplotherium, hyracotherium*, etc.; but with them are associated the remains of an opossum and of several carnivorous animals. Not only do the number of species increase in the miocene beds, but they represent a larger number of orders. There have been discovered two monkeys, numerous proboscidian pachyderms, as the *dinotherium, mastodon*, and *elephant*, two or three cetaceans, an enormous ant-eater, and several carnivora. The fossils of the pleiocene and pleistocene beds are still more numerous, and represent a race of animals not unlike the living fauna, but generally of a gigantic size. The elephants, elks, and bears of Europe were the contemporaries of immense sloths and armadillos in South America, and of huge kangaroos and birds in Australasia. Associated with the bones of some of these extinct species have been found flint implements, and even the bones of man, but under circumstances that have caused great difference of opinion among observers as to their true age. See MAN.

MAM'MARY GLAND, ANATOMY OF. See BREAST.

MAMMARY GLAND, DISEASES OF. The following are some of the most important of these affections.

Acute inflammation of the breast, which is characterized by great swelling, tenderness, pain, and fever. There is a knotty feeling in the inflamed part, and matter soon forms; but the abscess is often slow in pointing. The affection may occur at any period of lactation, and sometimes arises from very trifling causes—as a loaded state of the bowels, too stimulating a diet, etc. The bowels should at once be cleared out by sharp purgatives; leeches and fomentations should be applied; the arm on the affected side should rest in a sling; and an opening should be made where matter can be felt. The milk should also be regularly drawn off, if it can be done without extreme pain.

Sore nipples are a frequent cause of the preceding disease. Among the remedies for excoriations, cracks, fissures, and ulcerations of the nipple which cause great pain in suckling, are the application of strong astringent lotions (tannin lotion, for example), touching the sore point with solid nitrate of silver (lunar caustic), and especially the application of collodion. In bad cases, a metallic shield must be placed on the nipple, to protect it from the clothes and from the child's mouth. The regular application of a liniment of rectified spirits and olive oil in equal parts will sometimes prevent this affection.

The mammary gland is also liable to hydatid disease (see HYDATID), to the morbid growth known as chronic tumor, serocystic disease, or glandular tumor, etc., and to cancer (q.v.).

MAMMEE APPLE, *Mammea Americana*, a highly esteemed fruit of the West Indies (where it is sometimes called the *wild apricot*) and tropical America. It is produced by a beautiful tree of the natural order *guttiferæ*, 60 to 70 ft. high. The fruit is roundish, from the size of a hen's egg to that of a small melon, with a thick leathery rind, and a very delicate inner rind adhering closely to the pulp, which must be carefully removed on account of its bitter taste. The pulp is firm and bright yellow, with peculiar sweet and very agreeable taste, and a pleasant aromatic odor. A similar fruit is produced by *mammea Africana*, an African species.

MAM'MOLA, a t. of south Italy, in the province of Reggio, 7½ m. from Gerace. It stands in a beautiful and fertile district on the Locano. Pop. '72, 7,804.

MAMMON, a Chaldee word denoting riches, and so used often in the Chaldee Targums and in the Syriac version. This meaning is given by Tertullian, Jerome, and Augustine; and so Christ employs it in Luke xvi. 9, 11, but Christ uses it also as a personification of the god of riches, as, "Ye cannot serve God and mammon." The derivation of the word is doubtful.

MAM'MOTH, the Russian name for the fossil elephant, whose remains are so common in the recent deposits of northern Europe. For a description of it, see the article FOSSIL ELEPHANT. The name is sometimes erroneously given to the mastodon.

MAMMOTH CAVE, the largest known cavern in the world, is in Edmonson co., Ky., near Green river, 130 m. s.s.w. of Lexington, on the road to Nashville. It consists of a series of caverns, and has been explored to a distance of 10 miles. In this cavern there

is a river crossed by a boat, and various eyeless animals are found, among others the "blind fish" (*amblyopsis spelæus*). Stalactites hang from the limestone rocks, and the earth is rich in niter. The equable temperature and nitrous atmosphere of the cavern having been recommended as a remedy for diseases of the lungs, a hotel was built in one of the larger chambers of the cave, for the accommodation of consumptive and asthmatic patients; but the use of it has been long discontinued. There are many circumstances to prove that the Mammoth cave is part of the course of a subterranean river which existed in a former condition of the surface.

MAMMOTH CAVE (*ante*), though the largest, is but one of a very large series of caves, lying beneath extensive districts of both Tennessee and Kentucky. It was discovered in 1809, and has always been private property. The principal stream, Echo river, is nearly three-quarters of a mile in length and has underground communication with Green river; the Styx is about 450 ft. long and is remarkable for a natural bridge of great beauty. Passages and avenues connect chambers or halls, placed at different levels; thus showing the slow progress of the stream in its course through the earth. Accurate measurement of the passages has never been permitted. The extreme length is said to be from 8 to 10 m., while the total length of passages cannot be less than 150 miles. Several of the largest chambers, called domes, extend through the entire height of the levels. Of these the most notable are the Stella, Mammoth, and Gorin's domes, each about 250 ft. high, and Lucy's dome, over 300 ft. high and 60 ft. in diameter. Cleveland avenue extends for more than 2 m. and presents a most wonderful variety of crystals and incrustations, "some massive and splendid; others delicate as the lily."

All of the halls offer to view numbers of stalagmites and stalactites, which in their varied and fantastic shapes—sometimes exhibiting weird or grotesque resemblance to natural or architectural objects—form, in conjunction with the streams and fountains, the picturesque scenery of the cavern. Startling effects are produced by the use of lights and fireworks, the Star chamber showing on its ceiling myriads of the glistening points from which it takes its name.

Geologists assign a million years as the approximate term for the production of this series of caves. There is at present no growth, but, on the contrary, a slow but continual decrease in size by the natural causes of decay and accretion. The process of formation seems to have been as follows: In their course through the soil the streams absorb a large amount of carbonic acid gas; this possesses the chemical power of taking up considerable quantities of carbonate of lime, thus by varied action forming large cavities, and depositing the carbonate, in part, on ceiling or floor or in the stalagmite and stalactite forms, and, in part, carrying it off into the river. In this way the caverns are in succession produced and closed up.

The variations in both the insect and fish life of the Mammoth cave from the ordinary type are scientifically of the highest interest as bearing upon and, it is claimed, favoring the doctrines of evolution and natural selection. That variation has taken place to accommodate animal life to exigencies of environment cannot be doubted, when we examine the blind and the totally eyeless species of fish and crawfish here found. It is not improbable that, if more thoroughly explored, fossil testimony of great value might be discovered

MAMUN, ABU'L ABBAS ABDALLA AL, Caliph of Bagdad, of the Abbaside dynasty, and son of Haroun al-Raschid, was b. in Bagdad, 786, and brought up along with his brothers under the care of the most illustrious men of the time. In 800 A.D. he was invested with the government of Khorassan; and after dispossessing his elder brother, Al-Amin, who had ascended the throne on the death of their father, became caliph, Oct. 4, 813. His reign was disturbed by internal dissensions, and rebellions of the outlying provinces. Africa and Yemen declared themselves independent, the subjection of Egypt, Syria, and Mesopotamia was merely nominal, but the rest was well and beneficently governed. Civilization advanced with rapid strides; ruined towns and devastated tracts were restored; and distributions from the royal treasury made to those who had suffered from earthquakes, drought, or any other unavoidable cause. In 827, Mamun abjured the orthodox religion, and joined the heterodox sect called Motasalis, compelling a number of his subjects to follow his example. Towards the close of his reign, a war broke out with the Greek emperor Theophilus, and soon afterwards Mamun died, Aug. 9, 834. Mamun was the most learned and liberal of the Abbaside caliphs, and is said to have expended 300,000 dinars (£137,500) on the translation of the works of the ancient Greek philosophers into Arabic, these works having been presented to him by the Byzantine emperor. He highly encouraged mathematics and astronomy, founded observatories at Bagdad and Kasiun (near Damascus), caused a degree of latitude to be measured, and the obliquity of the ecliptic to be estimated. His new city of Bagdad became the abode of men of science and letters, who flocked to it from all quarters; and Mamun himself personally superintended their labors. Mamun has left three works, two of which are on religious subjects

MAN. Under this heading, it is proposed to consider various topics relating to the physiology and natural history of man, which have not been treated of in independent

articles, such as the development of the physical qualities of man, the distinctive characteristics of man, and the antiquity of the human race. The question of the races or varieties of man has been already discussed in the article ETHNOLOGY; and for information regarding the mental and social nature of man, the reader is referred to the articles ETHICS, INSTINCT, INTELLECT, MIND, etc.

In tracing the development of the physical qualities, we shall follow the arrangement pursued by Quetelet in his celebrated treatise *Sur l'Homme*.

It is a very remarkable fact, the true causes of which we do not know, that more boys are born annually than girls. Taking his data from the principal European states, M. Bickes (quoted by Quetelet), who has collected more than 70,000,000 of observations, finds that in Europe generally 106 males are born to 100 females. In Great Britain, the ratio is not quite so high, being 104.75 to 100. To some extent, the age of the parents influences the sex of the children, and Mr. Sadler was led to the conclusion, that "the ratio in which the sexes are born is regulated by the difference of age of the parents, in such a manner that the sex of the father or the mother will preponderate beyond the average of the total number of births, according to the party which has the excess of age."

The probable value or duration of life immediately after birth is, in general, about 25 years in Belgium (Quetelet), 32.2 in France, 33 years in England (Rickman), and 47.2 in Geneva (Lombard). Towards the age of five years, the chances of prolonged life for both sexes is greatest, ranging from 48 to 50 years. It is impossible to state with scientific precision what is the natural length of a man's life, when all abnormal disturbing causes are removed; but so few persons exceed the age of 100 years that a century may be taken as the limit of man's existence.

The development of the height, weight, and strength, at different ages, has been studied by Quetelet, J. D. Forbes, Danson, and others. From a large number of observations made by Quetelet in Belgium, he deduces the following conclusions:

1. From birth there is an inequality both in weight and height between children of the two sexes: the average weight of a boy at birth being 3.20, and that of a girl 2.91 kilograms (1 kilogram=2.2 lbs.); the height of a boy being .496, and that of a girl .483 meters (1 meter=3.28 ft.). 2. The weight of a child diminishes slightly towards the third day after birth, and does not begin to increase sensibly until after the first week. 3. At equal ages, the boy is generally heavier than the girl. It is only at about the age of 12 that the individuals of both sexes are of the same weight. Between 1 and 11 years the difference in weight ranges from a kilogram to a kilogram and a half; between 16 and 20, it is nearly 6 kilograms; and after this period, 8 to 9 kilograms. 4. When man and woman have attained their full development, they weigh almost 20 times as much as at birth; while their height is about $3\frac{1}{4}$ times greater than it was at that period. 5. In old age, man and woman lose about 6 or 7 kilograms in weight, and 7 centimeters in height. 6. Man does not acquire his complete growth till after he has completed his 25th year; he attains his maximum weight at 40, and begins to waste sensibly after his 60th year. 7. Woman attains her maximum weight at the age of 50. During her reproductive period, the increase of her weight is very slight. 8. The weight of individuals who have been measured, and who were fully developed and well formed, varies within extremes which are nearly as 1 to 2; while the height varies within limits which at most are as 1 to $1\frac{1}{5}$, as may be seen from the following observed values:

	Maximum.	Minimum.	Average.
Weight of man	98.5 kilog.	49.1 kilog.	63.7 kilog.
" woman	93.8 "	39.8 "	55.2 "
Height of man	1.890 meters,	1.476 meters,	1.684 meters
woman	1.740 "	1.408 "	1.579 "

Quetelet instituted a series of experiments on the strength of persons of both sexes at various ages. He determined both the lumbar power (the weight that could be carried on the back) and the power of the hands by means of Regnier's dynamometer.

From his tabulated results, it appears that the lumbar power of females differs less from that of males during childhood than subsequently. During childhood, the lumbar power of boys is about one-third more than that of girls; towards the age of puberty, one-half; while in adult life it is more than twice as great. The average strength of a well-developed man is 89 kilograms, or nearly 19 kilegrams more than his weight in his dress, so that such a man might hold on for a short time by a rope with a weight of 19 kilograms attached to his body. From experiments on the power of the hands, it appears that the manual power of the male sex is greater than that of the female at all ages. Before puberty, the ratio is 3 to 2, and it afterwards becomes 9 to 5. It also appears that the hands acting together produce a greater effect than the sum of the effects they produce when acting singly; and that the right hand is about one-sixth stronger than the left.

Principal Forbes made a series of experiments on English, Scotch, and Irish students, which, in most respects, are strongly confirmatory of Quetelet's results, but which evince the superior development of the natives of this country, especially in strength. The following numbers are selected from Forbes's tables:

WEIGHT IN POUNDS, INCLUDING CLOTHES.

Age.	English.	Scotch.	Irish.	Belgians. (Quetelet.)
16	127	125.5	129	117.5
20	144	146.5	148	143.0
24	150	152.0	155	149.5
	HEIGHT IN INCHES, INCLUDING SHOES.			
16	66.5	66.8	...	64.2
20	68.7	69.1	69.8	67.9
24	68.9	69.3	70.2	68.2
	STRENGTH IN POUNDS.			
16	336	314	...	236
20	385	392	416	310
24	402	421	431	337

If we proceed to compare the human figure with that of the animals which in their form approximate most closely to man (viz., the anthropoid apes), the chief point that strikes us is the great relative size of the human brain-case and brain, and the comparatively small size and vertical direction of the face; the great length and muscularity of the lower extremities, and their adaptation to the erect position; the adaptation of the hand to the great variety of actions of which it is capable, due mainly to the fact, that the thumb can be opposed to the extremities of all the fingers, whether singly or in combination; the greater breadth of the pelvis, etc.

Those, however, who are inclined to support Mr. Darwin's hypothesis, maintain, that whatever system of organs be studied, the comparison of their modifications in the ape series leads to one and the same result—that the structural differences which separate man from the gorilla and the chimpanzee are not so great as those which separate the gorilla from the lower apes. This by no means implies that the structural differences between man and the highest apes are small and insignificant; it is admitted, on the contrary, "that they are great and significant; that every bone of the gorilla bears marks by which it might be distinguished from the corresponding bone of a man; and that, in the present creation, at any rate, no intermediate link bridges over the gap between *homo* and *troglodytes*.—Huxley.

The last point we shall notice is: When did man first appear upon the surface of the globe? All that can be definitely stated upon this subject is, that the geological researches of Boucher de Perthes, Falconer, Prestwich, sir Charles Lyell, and many others, show that while it is impossible to fix the date of man's appearance, or even to approximate to it, there is apparent evidence of his existence far beyond that which is assigned by our popular chronology. The flint implements which have been discovered in the lower gravels of Abbeville and elsewhere, have been already noticed in a special article, and their occurrence in association with the fossil bones of extinct mammals, and the other evidence of their antiquity deduced from their geological position, have been there described.

The Brixham caverns afford similar and corroborative evidence of the antiquity of man. They were discovered accidentally in 1858 by the roof of one of them falling in. Below a thick stalagmite crust, which formed their floor, and which contained some of the bones of the cave-bear, was a mass of loam of an ocherous red color, in some parts 15 ft. in thickness, in which were found remains of the mammoth, an extinct rhinoceros, the cave-bear, etc., and from various parts of these deposits flint-knives were obtained. Under the bone-deposit was a bed of gravel, which in some parts was more than 20 ft. thick. It contained no fossils, but even in its lowest parts were found specimens of flint knives. The fabricators of these knives must have lived long antecedently to the time when the work of their hands was covered with stalagmite; and contemporaneous with the stalagmite must have been the cave-bear, whose bones were imbedded in it. The ossiferous caves of South Wales (Gower), Sicily, etc., yield similar results. (See KENT'S CAVERN.)

There is reason to believe that in the island of Sardinia the land has risen 100 ft. since man inhabited its shores, possessing at that time the art of fishing by nets and of making a coarse pottery. The western extremity of the island of Crete has been raised about 25 ft. since the construction of its ancient ports, which are now high and dry above the sea. Supposing the movement to have been uniform and equal in the two islands, the mussel-beds of Cagliari (in Sardinia) must have emerged from the sea more than 20,000 years ago; but before that time, man fished the waters over them, if count de la Marmora is right in conjecturing that a flat ball of baked earthen-ware, with a hole through its axis (which was found imbedded among them), was used for weighting a fishing-net.

Our last illustration shall be taken from the New World. Agassiz estimates that the southern half of the peninsula of Florida, which is built up of coral reefs, took 135,000 years to form; and hence he would estimate the age of the human jaws and teeth and bones of the feet found in one of the coral banks to be 10,000 years old.

For further information on this interesting and difficult subject, we must refer the

reader to sir Charles Lyell's work *On the Antiquity of Man*. It is right to add that many still dispute the conclusions drawn from these facts; see *The Human Species*, by Quatrefages (1879).

MAN (*ante*). See BIOLOGY; SPECIES.

MANAAR', GULF OF, lies between the w. side of the island of Ceylon and Hindustan, and is divided from Palk's passage on the n. by the islands of Ramisseram and Manaar, and by a low reef called Adam's bridge. At its n.e. extremity it is 80 m. in width; while at its south-western limit it reaches a width of nearly 200 miles.

MANACA, *Franciscea uniflora* or *Hopeana*, a plant of the natural order *scrophulariaceæ*, a native of Brazil. The whole plant, and especially the root, is found to be of great value in exciting the lymphatic system. It is nauseously bitter, purgative, emetic, emmenagogue, and alexipharmic; in overdoses, an acrid poison. It is much used in Brazil as a remedy for syphilis.

MANACOR', a t. in the island of Majorca (q.v.), in a fertile plain, 30 m. e. of Palma. It manufactures brandy, wine, and oil. Pop. 10,000.

MANA'GUA, a t. of Central America, the capital of Nicaragua, in a healthy and fertile district on the south shore of lake Managua or Leon. It owes its position chiefly to the rivalries of the cities of Granada and Leon, but partly also to its central situation.

MAN'AKIN, one of the names of a bird belonging to the order *insessores*, called also chatterer (q.v.).

MANASSAS, BATTLES OF. See BULL RUN.

MANAS'SEH, (from Heb. *Nasha*, to forget, signifies, "one who causes to forget"), the name of the eldest son of Joseph. At the Exodus, the tribe of Manasseh is said to have counted 32,200 warriors, and on entering Canaan, 52,700. It received land on both sides of the Jordan. The eastern half embraced the rich pasture-lands of Argob and Bashan, as far as the slopes of Hermon; the western extended from the Jordan to the Mediterranean, and lay between Ephraim and Issachar. MANASSEH was also the name of one of the kings of Judah (the fourteenth), who succeeded his father Hezekiah, 699 B.C., at the age of 12, and reigned, according to the narrative, for 55 years. He rushed headlong into all manner of idolatry, and seduced the people to follow his example. The sacred writers cannot otherwise express their sense of the enormity of his guilt than by saying that the very heathen never went so far in their practice of abominations as Judah did in those days. His subsequent history is differently related in *Chronicles* and in the *Book of Kings*. The apocryphal composition called the *Prayer of Manasses* is received as canonical by the Greek church.

MANASSEH BEN-JOSEPH BEN-ISRAEL, 1604–57, b. Lisbon; educated at Amsterdam, where his father had removed to escape persecution. At the age of 18 he took the place of his former instructor, rabbi Isaac Uzziel, in the Amsterdam synagogue. In 1632 he set up a Hebrew printing-press at Amsterdam, and in 1632 published the first volume of his *Conciliador*, the Latin edition of which bears the title of *Conciliator, sive de Convenientia locorum S. Scripturæ*, etc. It is a learned harmony of the Pentateuch. Its author was at once recognized as the first Hebrew scholar in England, and among his correspondents were Vossius, H. Grotius, and Huet. In 1639, deprived of his property by the Spanish inquisition, he removed to Basle, and began business as a merchant. He came to England in the time of the protectorate with the view of securing from Cromwell the concession of additional rights to the Jews. He met with a favorable reception, and succeeded in accomplishing some of the objects of his mission, after which he returned to Amsterdam. He was a friend of Grotius, and other famous scholars, and his own literary activity was great. Besides the *Conciliador*, he published editions of the Talmud, and the Hebrew Bible; *A Defense of the Jews in England*, which appeared at London, during his English visit, a work on the resurrection of the dead; and various other treatises. There is an English translation of the *Conciliador*, by E. H. Lindo; and an English life of Manasseh, by Dr. Thomas Pococke.

MANATEE', or LAMANTIN, *Manatus*, a genus of herbivorous cetacea or *manatidæ* (q.v.), readily distinguished by the rounded tail-fin, and further characterized by the presence of small flat nails at the edge of the swimming paws, and by the structure of the grinders, which have square crowns with two transverse ridges. The species, which are all inhabitants of tropical coasts, feed not only on algæ, but on the plants which grow along the shore, and are rendered accessible to them by the tide, which, after it has retired, often exhibit plain proofs of their browsing. They live chiefly in shallow bays and creeks, and in the estuaries of rivers, and often ascend rivers to a great distance from the sea. The best known species (*M. Americanus*) is found in the West Indies and on the western coasts of tropical America. It sometimes attains a length of 20 ft., and a weight of 3 or 4 tons. The skin is very thick and strong, and is almost destitute of hair. The fingers can be readily felt in the swimming paws, and, connected together as they are, possess considerable power of motion, whence the name manatee (from Lat. *manus*, a hand). The manatee is usually found in herds, which combine for mutual protection when attacked, placing the young in the center. When one is struck with a harpoon, the others try to tear out the weapon. The females show great affection for

their young. No animal is more gentle and inoffensive than the manatee. It has been tamed and rendered familiar enough to come for food when called. Vast numbers were formerly found in places where it is now comparatively rare, as its capture is easy, and its flesh—which has been variously likened to beef and pork—is held in considerable esteem. A common name for the manatee is sea-cow.—Another species is found on the coast of Florida, and a third on the w. coast of Africa.

MANATEE', a co. of s.w. Florida on the gulf of Mexico, having the Caloosahatchee river on the s., and lake Okeechobee on the s.e.; watered by the Manatee river and small streams; 4,070 sq.m.; pop. '80, 3,655. The surface is generally level, and the soil not very productive; it grows, however, Indian corn, sweet potatoes, rice, and a little sugar and cotton. Co. seat, Manatee.

MANATIDÆ, a family of *cetacea*, including all the herbivorous section of the order. Besides the distinguishing characteristics mentioned in the article CETACEA, they differ from the ordinary cetacea in having swimming paws rather than pectoral fins. It has been supposed that some of the stories of mermaids may have originated in the females of some of the manitidæ being seen with the head and breasts raised out of the water. There are three genera of manitidæ, described in the articles DUGONG, MANATEE, and STELLERINE.

MANAYUNK', a part of the city of Philadelphia, on the e. bank of the Schuylkill river, and on the Reading railroad; connected with the heart of the city by steam and horse cars, boats on the Schuylkill, and a well-made highway. The canal of the Schuylkill navigation company, extending 2 m. along the river, affords extensive water-power, which is employed in the manufacture of cotton and woolen goods and paper. There are 30 manufacturing establishments, with a capital of $6,000,000, employing nearly 5,000 persons, and producing goods annually valued at $10,000,000. The place has 8 churches, 2 weekly newspapers, 1 bank, 5 insurance companies, excellent schools, water and gas works, and a good market-house.

MANBY, GEORGE WILLIAM, favorably known for his exertions in saving the lives of persons in danger of shipwreck, was b. in 1765 at Hilgay, near Downham market in Suffolk. After studying for the army, he served seven years in the militia. Receiving the appointment of barrack-master at Yarmouth in 1803, he had frequent opportunities of witnessing the ravages produced by storms on the coast of Norfolk and Suffolk. A dreadful series of shipwrecks on a particular day in 1807, when H. M. gun-brig *Snipe* was wrecked within 60 yards of the shore, and 67 lives lost, and when 147 dead bodies were found on about 30 m. of coast, drew his attention forcibly to the subject, and led him to experiments which resulted in the invention of the apparatus known by his name (see LIFE MORTARS AND ROCKETS). On Feb. 12, 1808, he succeeded in saving the lives of the crew of the brig *Elizabeth*, which was stranded at 150 yards from the shore; he sent a rope over to them by means of a shot, and this rope was the means of pulling a boat from the shore to the brig. A career of usefulness was thus commenced, which he followed for the remaining 46 years of his life. In 1810 a committee of the house of commons voted £2,000 to Manby, as a token of recognition of his services. Being appointed to report on the dangers of the Norfolk and Suffolk coasts, he recommended the establishment of mortar-stations at certain intervals. This recommendation was adopted by the house of commons and the government; and by the year 1815 there were nearly 60 such stations. Capt. Manby received a further grant from parliament in 1823 of £5,000; to which were added honorary distinctions from many foreign governments. It was estimated that, by the time of his death, nearly 1000 persons had been rescued from stranded ships by means of his apparatus. He wrote two works on his favorite subject: *An Essay on the Preservation of Shipwrecked Persons, with a descriptive account of the Apparatus, etc.* (1812); and *Practical Observations on the Preservation of Mariners from Stranded Vessels, and the Prevention of Shipwreck* (1827). In what manner his system has since been superseded by one of a more effective kind, is described under LIFE MORTARS AND ROCKETS. Capt. Manby died Nov. 18, 1854.

MANCH, or MAUNCH (Fr. *manche*), a frequent charge in English heraldry, meant to represent a sleeve with long pendant ends, of the form worn by ladies in the reign of Henry I. Or, a manch gules, has been for a long time the arms of the Hastings family, one of whom was steward of the household to Henry I.

MAN'CHA, or LA MANCHA, a district of Spain, in the province of Ciudad Real, and the southernmost part of the kingdom of New Castile. See CASTILE.

MANCHE, a maritime department in the n.w. of France, formed from the most western district of the old province of Normandy, derives its name from La Manche (the English channel), which washes its coasts. Greatest length, 98 m.; average breadth, 27 m.; area, 1,426,289 acres. Pop. '76, 539,910. Of the entire area, 940,047 acres are cultivated, and about 235,000 acres are in meadow. The surface of the department is irregular; hills of no great elevation traverse it from n. to south. The Vire, the Douve, and the Selune are the chief rivers. The climate is mild and temperate, but somewhat humid. Flax, hemp, and fruit are extensively cultivated. Immense quantities of apples are grown, from which 44,000,000 gallons of cider are made annually. Horses of the true Norman breed are reared in the pastures, and excellent cattle of large size

are bred in the valleys. The department is divided into the six arrondissements of St. Lô, Coutances, Valognes, Cherbourg, Avranches, and Mortain. Capital, St. Lô.

MANCHESTER, a t. in Hartford co., Conn.; 8 m. e. of Hartford, on the Hartford, Providence and Fishkill railroad; pop. 4,223. The place is extensively engaged in manufacturing, there being over a dozen paper mills, and others of woolen, cotton, needles, and so on. The largest of all is the silk factory of Cheney Bros., which covers 7 or 8 acres and employs more than 1000 operatives. There is a newspaper, library, town-hall, and many schools, churches, and stores.

MANCHESTER, a t. in Essex co., Mass., on the n. shore of Massachusetts bay, and on the Gloucester branch of the Eastern railroad, 8 m. n.e. of Salem. Pop., 1665. It has 3 churches, a public library, and manufactures of leather and furniture. The purity of the air and the fine ocean views make it an attractive summer resort for many residents of Boston, New York, and other cities.

MANCHESTER, a city of New Hampshire, on the e. bank of the Merrimac river, at the falls of Amoskeag, 18 m. s. of Concord, 59 m. n.w. of Boston. The town is laid out in broad streets, shaded with elms, with 5 public squares. The falls of 54 ft. in a mile afford water-power to 5 manufacturing companies, with factories of cotton, paper, locomotives, hardware, etc. There are also extensive print-works and starch-mills. There are 16 churches, 45 public schools, 9 banks, and 2 daily and 3 weekly newspapers. Pop. '38, 50; '60, 20,107; '70, 23,536.

MANCHESTER (*ante*), a city in Hillsborough co., N. H., is reached by 4 railroads, the Concord, the Concord and Portsmouth, Manchester and Lawrence, and Manchester and North Weare. Its original name was Derryfield, under which it was incorporated in 1751. Its present name was taken in 1810, and the city charter dates from 1846. Cotton and woolen manufactories produce an enormous quantity of goods annually; water-power being furnished by the Merrimac river through canals leading from the Amoskeag falls to the mills, 4 of which have more than 300,000 spindles. There are also extensive locomotive, leather, boot and shoe, and tool shops. Among the principal public buildings are the court-house, state reform school, library, Roman Catholic convent, and others. There are 7 newspapers, of which 2 are dailies; 9 banks, and a very large number of schools and churches. The town was originally settled in 1722 by Scotch-Irish Presbyterians. The amount of capital invested in manufactures cannot be less than $10,000,000, and in this respect it is surpassed by only 3 or 4 cities in the United States. There is a great variety of manufactures besides those of cotton and woolen goods, such as boots and shoes, stockings, paper, cutlery, locomotives, steam-fire-engines. The 4 great corporations are the Amoskeag manufacturing co., the Manchester mills, the Stark mills, and the Langdon mills. The city has an excellent supply of water from Massabeesick lake, near by.

MANCHESTER, the capital of Bennington co., Vt., on the Harlem Extension railroad, 30 m. s. of Rutland, and 60 m. n. of Troy, N. Y.; pop. 1897. Its fine mountain scenery, the purity of its atmosphere, and its picturesque walks and drives, make it attractive as a resort during the summer. It has 2 churches, a classical school for both sexes, a newspaper, and is the seat of the Burr and Barton seminary.

MANCHESTER, a village of Chesterfield co., Va., on the s. bank of the James river, opposite Richmond, and the seat of important manufactures; pop. 2,599.

MANCHESTER (Sax. *Mamcestre*), a city, municipal and parliamentary borough of Lancashire, and the great center of the cotton manufacture of the n.w. of England, stands on the Irwell, 32 m. e.n.e. of Liverpool, and 188 m. n.n.w. of London by railway. On the w. side of the Irwell is the borough of Salford, communicating with that of Manchester by means of 10 bridges, and considered as virtually a portion of the city.

By the census of 1871 the inhabitants of the parliamentary borough of Manchester were 383,843, and the increase from 1851 was 67,255. In the adjoining borough of Salford the pop. in 1871 was 124,805, the increase from 1851 having been 39,662. The area of the borough of Manchester is 9.9 sq.m.; of Salford, 7.9 sq.miles. Both boroughs were enfranchised by the reform bill of 1832, Manchester returning 2 members, and Salford one member, to parliament. The reform bill of 1867 gave Manchester 3, and Salford 2 members. Manchester was incorporated in 1838, and Salford in 1844. Manchester was made a bishopric in 1847, and received the title of city in 1853. Water for the supply of Manchester is collected on the Lancashire side of Blackstone Edge, at Woodhead, and conducted from a series of reservoirs through iron pipes, nearly 20 m., to the borough. The water-works, in which are invested about £3,750,000, and the gas-works, involving about £450,000, belong to the corporation. The manorial and market rights were also acquired by the corporation in 1845 for the sum of £200,000. There are 4 public markets in Manchester, and 2 in Salford, besides the cattle market. Smithfield market in Manchester is more than 4 acres in extent, and is entirely covered in. The market-tolls and rents of Manchester alone amount to £35,000 per annum. The sale of gas makes a profit of some £44,000 per annum, which is devoted to improvements in the borough. In 1845–46 a public subscription founded 3 parks of about 30 acres each, and the corporation has since acquired a fourth park of about 60 acres. Manchester was also the first borough to take advantage of the free libraries' act, which allows an appro-

priation of a penny in the pound on the local assessment for parks, libraries, and museums; and here also was established the first free lending library in England. Five branch lending libraries and a museum have since been established in Manchester, and one reference library, one branch lending library, and an excellent museum in Salford; so that, including the old college library founded by sir Humphrey Cheetham, 1662, the people of Manchester and Salford have the free use of upwards of 130,000 volumes of ancient and modern literature, besides newspapers and periodicals.

The two boroughs have about 100 churches belonging to the establishment. The cathedral, commonly called the *old church*, built 1422, is a very fine Gothic structure, and has latterly undergone a very extensive process of restoration in its original style. There are 17 Roman Catholic and 180 dissenting chapels, some of which, especially St. John's Catholic cathedral, the church of the Holy Name, and Cavendish independent chapel, are very beautiful specimens of modern Gothic architecture. There are 3 Jewish synagogues, 4 German churches, and 1 Greek church. The principal public buildings for secular purposes are the town-hall, built at the cost of three-fourths of a million sterling, in Gothic; the royal infirmary, the royal exchange, the royal institution, all in the Grecian style; the free-trade hall, in composite; and the assize courts, in decorated Gothic. There is a home for 150 convalescents in the suburbs, founded by Robert Barnes, a former mayor of Manchester. Many of the warehouses of the merchants are palatial in appearance, and the business transacted is quite in accordance with the magnitude of the buildings. The floor of the royal exchange contains about 5,170 square yards, and is yet thronged on market-day. Manchester has four private and five joint-stock banks, besides branches of the bank of England and the national provincial bank. The celebrated Bridgewater canal connects Manchester with Liverpool, and access is also obtained for heavy barges by the rivers Irwell and Mersey. There is communication by railway in every direction. When the widening of Deansgate, Victoria street, and St. Mary's Gate took place, it caused the demolition of considerable property, and the site was sold by the corporation for £288,960, or £56 per square yard. In Albert square a prince Albert memorial has been erected. A bronze statue of Richard Cobden stands in St. Ann's square; and there is one of Cromwell (unveiled in 1875) at the foot of Victoria street. Manchester publishes 15 journals and newspapers, 5 of which are issued daily.

The chief trade is cotton spinning and manufacturing, including calico-printing and bleaching and dyeing; but there are also considerable manufactures of silk and mixed goods, of small-wares, of machinery and tools, of paper and chemicals; and Manchester is also a depot for all kinds of textile fabrics, and does a very large export trade. There are ordinarily employed in the cotton-mills about 60,000 persons, who earn about £30,000 per week in wages. There are at least 7,000 skilled mechanics constantly engaged in the production of steam-engines, spinning-mules, looms, and other machinery, chiefly for the production of the various textile fabrics, whose wages average about 32s. each per week, and who need some 1500 laborers to assist them.

The educational endowments of Manchester are small compared with its population. There is a hospital school for 100 boys, founded by Sir Humphrey Cheetham, and incorporated by Charles II.; there is also a grammar-school, with about 250 free, and 350 paying pupils, founded 1519, by Hugh Oldham, bishop of Exeter. According to a school-board return in 1873, the number of day-scholars in Manchester was 38,500 in actual attendance; and in evening schools and literary institutions there are from 4,000 to 5,000 pupils. In 1846 John Owens, a Manchester merchant, left £100,000 to found a college for secular instruction; and in connection with that institution, there are now more than 800 day and evening students. The college is well conducted, and is steadily rising in popularity. In 1873 a new building was erected at a cost of about £90,000, and the royal school of medicine was incorporated with it, whilst the natural history society and the geological societies handed over their collections into its keeping. A mechanics' institution was commenced in 1824, and is still carried on successfully. It has day and evening classes, a good library and reading-room, and all the necessary appliances for secondary education. Similar institutions on a smaller scale exist in Salford, and in the out-townships of Longsight, Rusholme, Harpurhey, Cheetham Hill, and Pendleton. In Manchester originated the agitation for free trade (see ANTI-CORN-LAW LEAGUE). Manchester was also the first place to secure the privilege of inland bonding for articles chargeable with customs duties, and now produces a large revenue from that source.

Camden, who died in 1623, says: "Where the Irk runs into the Irwell, on the left-hand bank, and scarce three miles from the Mersey, stands that ancient town called in *Antoninus* (according to different copies), *Mancunium* and *Manutium*. Perhaps, as an inland town, it has the best trade of any in these northern parts. The fustian manufacture, called *Manchester cottons*, still continues there; this, with a great variety of other manufactures, called *Manchester wares*, renders not only the town itself, but the parish about it rich, populous, and industrious." The parish of Manchester covers a large area, reaching to Stockport, Oldham, and Ashton-under-Lyne, and in the early part of the 16th c. was reckoned to have 20,000 communicants.

MANCHINEEL', *Hippomane mancinella*, a tropical American tree of the natural order *euphorbiaceæ*, celebrated for the poisonous properties of the acrid milky juice with which every part of it abounds. A drop of this juice, which is of a pure white color,

burns like fire if it falls upon the skin, and the sore which it produces is very difficult to heal. The Indians of tropical America use it for poisoning their arrows. The fruit is in form, color, and scent not unlike a small apple—the name is from the Spanish *manzanilla*, a small apple—and contains a nut about the size of a chestnut. The fluid which the fruit contains is milder than that of other parts of the tree, but its acridity is so great as immediately to repel any who, tempted by its appearance and citron-like fragrance, may ignorantly attempt to eat it. The leaves are alternate, ovate, serrate, and shining. It is said that, owing to the volatile nature of the poisonous juice, persons have even died from sleeping under the shade of the manchineel tree. Much seems to depend on the state of the atmosphere, and there is good evidence that rain or dew falling from the branches of the manchineel does produce injurious effects. The fruit of manchineel dried and pulverized, is diuretic; the seeds are excessively so. The wood is of fine quality, and well suited for cabinet-making. Whole forests of manchineel at one time existed in Martinique, which have been burned down. It grows chiefly in the vicinity of the sea. *Cameraria latifolia*, another West Indian tree, of the natural order *apocynaceæ*, is called BASTARD MANCHINEEL, from its resemblance to manchineel in its poisonous properties.

MANCHOORIA. See MANTCHURIA, *ante*.

MANCI'NI, a Roman family, beginning historically in the 14th c. with the name of Pietro Omni-Santi, surnamed Mancini dei Luci. Cardinal Francesco Maria Mancini, who married a sister of cardinal Mazarin in 1634, is the next distinguished member. His daughters, noted for their beauty and their intrigues, are spoken of by Michelet as "a battalion of Mazarin's nieces."—LAURE, 1635–57, was a favorite of Louis XIV. when prince.—OLYMPE, 1639–1708, of the "black soul and black face," a mischievous beauty, was his mistress, who was married to an Italian and bore 8 children, was charged with poisoning her husband, and became a wanderer out of France, and when in Spain was suspected of poisoning Louise, the wife of king Charles II. Prince Eugene of Savoy was one of her five sons.—MARIE, 1640–1715, another mistress of Louis XIV., who came near marrying her. She married prince Collonna in 1661, bore several children, quarreled with and left her husband, returned to Paris in want, was placed in a convent by Louis XIV., and subsequently led an adventurous life.—HORTENSE, 1646–99, a beauty, courted by Charles II. of England, by marshal Turenne, and Charles de Lorraine, was married to Armand de la Porte, marquis de la Meilleraye, who soon after assumed the title of duke of Mazarin on the death of the cardinal. She, too, was supposed to have been too free not only with Louis XIV., but with her former lovers; left her husband, entered the court of Charles Emanuel of Savoy; and on his death was expelled by his widow. She then visited Germany, and then Charles II. of England, who was soon again one of her suitors, fixed an annuity upon her, and allowed her a home in the palace of St. James.—MARIE ANNE, 1649–1714, went to Paris in 1655, was married to Maurice Godefroi de la Tour, duc de Bouillon, in 1662; soon left and afterwards rejoined her husband; became the patroness of La Fontaine, and made her home a literary center, where Molière, Corneille, and other celebrities met. She, too, became suspected of the use of poisons, and fled Paris in 1680, lived 8 years in England, 2 in Venice and Rome, and returned to Paris in 1690, where her society was courted to the last. She seems to have been the least disreputable, or vile, of a beautiful family which, if living in the present day, would be denizens of other places than the palaces of the rulers of great nations.

MANCI'NI, PASQUALE STANISLAUS, b. Naples about 1815. He became a professor of law quite young at the university of Naples; deputy to the Neapolitan parliament in 1848, and editor of a famous protest of the liberal party against the acts of Ferdinand II. Self-exiled to escape the hospitable dungeons of Ferdinand he fled to Turin, where he achieved a brilliant success at the bar, and was made law professor of the university of that city. He made a specialty of teaching the principle of nationalities as distinguished from dynasties. He was member of the Piedmontese chamber of deputies when Garibaldi's movements cut the knot of Neapolitan slavery; and he became minister of justice and ecclesiastical affairs in the provisional government. He promulgated an order to break up the mendicant and "contemplative" orders; but public opinion was not ripe for it, and it was not executed. He was deputy to the first Italian parliament in 1861, and became one of the leaders of the center, *consorteria;* one of the most brilliant orators of the parliament, and an active promoter of Italian unity and progress.

MANCO CAPAC' I., by Peruvian tradition, was the first of the Incas, and founded the royal race several centuries before the invasion of the Spaniards. He is represented in legends as a child of the sun, who with his wife, Mama Oello, instructed the natives of Peru in science, art, and architecture, and predicted the overthrow of the twelfth of his dynasty by a white race from distant lands.

MANCO CAPAC' II., the last Peruvian Inca who made any serious opposition to the Spanish power. He was the son of Huayna Capac by the daughter of a conquered chieftain of Quito. His half-brothers Huascar and Atahuallpa engaged in civil war upon their father's death, and the latter defeated and executed his rival. Atahuallpa, trusting the faith of the Spaniards, was himself falsely accused and executed in 1533.

After the death of Toparca, whose claims to the throne were supported by Pizarro, Manco claimed the title, and for a time allowed himself to be used as Pizarro's tool. But his character was naturally bold and independent; he soon escaped from his degradation, and in 1536 laid siege to Cuzco, a great part of which he burned. This was the last triumph of the Peruvian race. Manco took refuge in the Cordilleras, and for years carried on an irregular warfare to the great annoyance of his enemies. Pizarro's cruelty in scourging publicly to death a favorite wife of the Inca in retaliation for the slaying of a Spanish messenger, rendered all thought of reconciliation impossible. In 1544 Manco was killed by a party of Almagros soldiers who had taken refuge in his camp.

MAND. See ELEUSINE.

MANDALAY, MANDELAY, or PATTAWAPURA, the present capital of the kingdom of Burmah, lies 3 m. from the Irrawaddy river, a little n. of the former capital Amarapura (q.v.), and 350 m. n. of Rangoon. In 1856 its site was occupied by cultivated fields; but having been chosen by the king as the position for a new capital, was in the following year ready to receive the court. The city is laid out in three parallelograms, of which the inner two are walled. Within the inmost are the palace, and offices of government; in the second inclosure are the houses of the civil and military officers, and the quarter of the soldiers; while the outer city is inhabited by merchants, mechanics, etc. Pop. about 90,000.

MANDALAY (*ante*), situated on a bend of the Irrawaddy river, about 17 m. above the ancient capital of Amarapoora, became the capital of Burmah by command of the king in 1853. It is 400 m. n. of Rangoon, the great sea-port of all Burmah, and is reached by way of the river on steamboats. The climate is pestilential, and but for the swine, which act as scavengers, the filth to be found in all directions would render the city uninhabitable. Pigs crowd the highways, feeding from the refuse that is scattered everywhere, and these animals are under protection, and have even been the subject of provision on the part of benevolent individuals, who remembered them in their wills for the good of the city. The place is further infested with pariah dogs, vicious and noisy. The dwellings in Mandalay are constructed of bamboo, and of a dark red wood found throughout Burmah, the latter being usually ornamented with beautiful carvings. Such houses have three or four roofs, which give them an extremely picturesque appearance. A monastery near the city contains in its court-yard a number of statues representing the Buddhist Gautama, the founder of that religion, in various attitudes. A sluggish stream, the Schway-ta-Choung, with several carved wooden bridges, is near by, on the left bank of which stands the building of the former British residency, now abandoned. The citadel is built in a perfect square, of which each front is a mile in length. It is protected by a high crenelated wall, adorned at intervals by pretty seven-roofed kiosks; and by a broad moat filled with clear water, on whose surface float masses of blooming lotus-flowers, with here and there a carved war-boat, whose prow presents the figure of a dragon. A heavy gate and drawbridge at each side of the wall give access to the citadel, and are guarded by Burmese soldiers. Within are the hall of justice, the royal palace, and the abode of the sacred white elephant. The present king of Burmah, Theebaw, resides in the palace. He is the son of the late king Mindoon Men, and the youngest of three brothers. Great efforts were made towards the education of this prince, and he was trained in a Burmese convent. But on the death of his father, he seized the government, causing all the friends and near relatives of the other princes to be murdered, while they only escaped by seeking the protection of the British residency in disguise. They were afterwards smuggled to the British frontier, and were shipped to Calcutta, whence they have twice returned to Burmah, and raised rebellions, which, however, proved ineffectual. Since his accession to the throne, king Theebaw has become notorious for his bloodthirsty cruelties, until it has become a common incident to see Burmese publicly crucified in the streets of Mandalay under his orders. His reign has been one of the most vicious and despicable known to recent oriental history.

MANDA'MUS is a prerogative writ which issues from the court of queen's bench, and in some cases a similar writ issues also from the other superior courts of law, whereby the court commands some public body, or inferior court, or justices of the peace, to do something which it is their legal duty to do, and the neglect of which there is no other way of redressing.

MANDA'MUS (*ante*) is issued in this country by the highest court which has jurisdiction at law. The writ enjoins upon a court of inferior jurisdiction, a person or a corporation, the performance of a particular act as their duty. This is the usual remedy to enforce the performance by a corporation of acts within the legitimate sphere of its duties, though it will not be granted to enforce ordinary rights of contract, for which there is already a sufficient remedy in the law courts. It lies to compel the production by a corporation of its records and papers, when their evidence is material to a suit brought by a corporator; and to reinstall an ejected officer of a corporation in his office after his title thereto has been maintained at *quo warranto*. It is not granted as of right, but is issuable at the discretion of the court, and ought to be used, according to lord Mansfield, "upon all occasions where the law has established no specific remedy, and

where in justice and good government there ought to be one;" in other words, a court will not take jurisdiction by this writ unless there be no definite remedy at law.

MAN'DANS, the name of a tribe of Indians who have always inhabited the lands along the upper Missouri, having been forced by the exigencies of Indian warfare from a point about 1500 m. from the mouth of that river to their present habitat, near fort Berthold, Dakotah territory. They are of the Dakotah family, and have always been at enmity with the Sioux, who still pursue them with persistent ferocity. In 1870 a reservation of about 9,000,000 acres, partly in Dakotah and partly in Montana, was set apart by the government for the Rickarees, Minnetarees, and Dakotahs, and on this the remnant of the tribe continues to reside, numbering in 1875 about 500 souls. The Mandans are generally peaceful, live by agriculture and hunting, and are notable for the interesting and peculiar character of their rites and ceremonies, the burial of their dead, and their mode of initiating warriors. No missionary work of any importance has been performed among them, and but slight attempts have been made for their education.

MANDA'RA, or WANDALA, a kingdom in w. central Africa, s. of Bornou (or Bornoo), to which it is now tributary, situated in a fertile valley abounding in fig and other fruit and flowering trees, well watered by many springs, and protected from assault by a range of the mountains of the Moon. It is inhabited by a race of negroes much further advanced in civilization than any of the neighboring tribes, who engage quite extensively in iron and cloth manufacture and possess bodies of drilled and uniformed cavalry. The country was formerly included in Karowa, s.w. of Mandara, but became independent mainly through the adoption of the Mohammedan faith. In 1863 a war was waged with Bornou and the country was entirely subjugated, Mora, its former capital, being razed to the ground. Doloo, pop. 30,000, is now its chief city.

MANDARIN', a general term applied to Chinese officers of every grade by foreigners. It is derived from the Portuguese *mandar*, to command; the Chinese equivalent is *kwan*. There are nine ranks, each distinguished by a different-colored ball or button placed on the apex of the cap, by a peculiar emblazonry on the breast, and a different clasp of the girdle. The balls are ruby, coral, sapphire, a blue opaque stone, crystal, opaque white shell, worked gold, plain gold, and silver. Theoretically, these grades are indicative of relative merit, but as office and titles are sold to a great extent, the competitive examinations, which are the only legitimate road to distinction, have lost much of their value. A mandarin is not allowed to hold office in his native province, the intention being to prevent intrigue, and to draw to Pekin the ambition and talent of the country, where temporary employment is given in subordinate offices, prior to appointments to the provinces. He is not allowed to marry in the jurisdiction under his control, nor own land in it, nor have a near relative holding office under him; and he is seldom continued in office in the station or province for more than three years—a system of espionage which serves further to strengthen the imperial government. It is incumbent on every provincial officer to report on the character and qualifications of all under him, which he periodically transmits to the board of civil office; the points of character are arranged under six different heads, viz., those who are not diligent, the inefficient, the superficial, the untalented, superannuated, and diseased. According to the opinions given in this report, officers are elevated or degraded so many steps in the scale of merit, like boys in a class. They are required also to accuse themselves when remiss or guilty of crime, and to request punishment.

MANDARIN', a village of Duval co., Fla., on the e. bank of the St. John's river, 15 m. above Jacksonville. It is a place of winter resort, and celebrated for its fine orange crops.

MANDARIN' DUCK, a species of domestic duck brought from China and Japan. It has a brilliant plumage, a beautiful green crest, and a tuft of feathers on the back in the shape of a fan. These ducks have the reputation of conjugal fidelity and of never mating but once.

MAN'DATE is a contract by which one employs another to manage something gratuitously for him. The one is called a mandant, and the other a mandatory; the term being derived from the Roman law of *mandatum*. In England, in consequence of the doctrine that a simple contract cannot be enforced unless there is some consideration for it, or a *quid pro quo*, it is held that if the mandatory undertakes to do the work, but omits to do so, no action will lie against him, though it is otherwise if he once enter upon the work, in which case he is bound for the consequences of anything injurious or negligent. If the duty or work is undertaken, the mandatory is bound to use reasonable skill and diligence. In Scotland, where a consideration is not necessary to make a valid contract by word of mouth or writing, the mandatory is liable to an action if he has contracted or agreed to act. In Scotland, the word mandatory is used to denote a person who, in a litigation by a foreigner or person residing out of Scotland, undertakes to give security for costs, in the event of the mandant losing the suit, otherwise the suit is not allowed to go on in Scotland.

MANDAVI, the chief seaport of the principality of Cutch, Hindustan, on the n. shore of the gulf of Cutch, in lat. 22° 51′ n., long. 69° 26′ east. Though there is no regular landing-place, boats of any size can land at the sandy beach, and large vessels

find secure anchorage in the offing at a distance of about three miles from shore. Its wells are numerous, and full of water. Pop. officially estimated in 1872 at 35,988.

MANDEVILLE, Sir JOHN, an old English traveler, b. at St. Albans about the year 1300. Prompted by curiosity or love of adventure, he left his native country about 1327, visited the Holy Land, served under the sultan of Egypt and the great khan of Cathay (China); and after 33 years' wandering through Europe, Asia, and Africa, returned to England, where he wrote an account of his travels in Latin, French, and English. He died at Liége, Nov. 17, 1372. Mandeville's work is not of great value for historic geography, as he not merely states what came under his own observation, but what he heard; and he was credulous enough to admit what are now regarded as the most absurd and monstrous fables; but to do him justice, he (like Herodotus) customarily prefaces these by the phrases, "thei seyne, or men seyn, but I have not sene it." Besides, several of his statements, once regarded as improbable, have since been verified. The common notion of his being pre-eminently a "lying" traveler, is therefore in all likelihood not well founded. Leland the antiquary even says, that he had the reputation of being a very conscientious man. His book is written in a very interesting manner, was long exceedingly popular, and was translated into many languages. A MS. of Mandeville's travels, as old as the time of the author, exists in the Cottonian library. The first edition printed in England is that by Wynkin de Worde (Westminster, 1499); the last, with introduction, etc., by J. O. Halliwell, was published in London in 1839 (reprinted 1866).

MANDIBULA'TA, MANDI'BULATED or MASTICATING INSECTS, a great group or division of insects (q.v.), having the mouth of the structure described in the article *coleoptera*, and containing the orders *coleoptera, orthoptera, neuroptera,* and *hymenoptera.* The *haustellate* mouth—formed for suction—is regarded as a modification, in all its separate parts, of the mandibulate mouth.

MANDIN'GOES are, strictly speaking, the inhabitants of the most south-westerly territories belonging to the great w. African race of the Wangarawa (sing. Wangara), and inhabiting a district extending in lat. from 8° to 12° n., and between the west coasts and the head waters of the Senegal and Niger. The name, however, as generally used, is applied to the whole nation of the Wangarawa, comprising a pop. estimated by Dr. Barth at from 6,000,000 to 8,000,000. The original seat of the Mandingoes is said to be Manding, a small mountain country on the eastern sources of the Senegal, whence, partly by conquest and partly by emigration, they have spread themselves over a most extensive tract of country, and now consist of a variety of tribes. The Mandingoes are black in color, tall and well shaped, with regular features, and are, generally speaking, a fine race, capable of a high degree of civilization and organization, great travelers, fond of trading, and remarkable for their industry and energy. Of the neighboring nations, they were the first who embraced Islamism. The greater portion of them are now Moslems, and are zealous propagators of their religion.

MANDOLINE, a musical instrument of the lute species. The body of the mandoline is shaped like a shell, formed of a number of narrow pieces of different kinds of wood, bent into the shape, and glued together. On the open portion of the body is fixed the sounding-board, with a finger-board and neck like a guitar. The Neapolitan mandoline, which is the most perfect, has four double strings, which are turned, beginning with the lowest, G, D, A, E. The Milanese mandoline has five double strings, tuned G, C, A, D, E. The sound of the mandoline is produced by a plectrum in the right hand, while the left hand produces the notes on the finger-board. The mandoline is chiefly used for accompaniment; in the beauty and quality of its sound it is different from all other stringed instruments.

MANDRAKE, *Mandragora,* a genus of plants of the natural order *solanaceæ,* nearly allied to belladonna (q.v.). Two species are described by some botanists, the AUTUMNAL MANDRAKE (*M. autumnalis*), which flowers in autumn, and has lanceolate leaves and ovate berries; and the VERNAL MANDRAKE (*M. vernalis*), which flowers in spring, and has oblong ovate leaves and globose berries. Both are natives of the south of Europe and of the east, and are united by many into one species (*M. officinarum*). The root is large and carrot-like, and from it the leaves spring with no apparent stem, and among them the stalked whitish flowers. The calyx and corolla are 5-cleft, there are 5 stamens, and the fruit is a one-celled berry, about the size of a sparrow's egg. The whole plant has a very fetid narcotic smell; but the fresh berries, when cut or bruised, have a pleasant odor like that of wine or apples, and two or three may be eaten without inconvenience. All parts of the plant, however, have poisonous properties like those of belladonna, but more narcotic, for which reason a dose of the root was formerly sometimes given to patients about to endure surgical operations. The ancients were well acquainted with the narcotic and stupefying properties of mandrake, and it was a common saying, of a sleepy or indolent man, that he *had eaten mandrake.* The root often divides into two, and presents a rude resemblance to the human figure; and human figures were formerly often cut out of it, to which many magical virtues were ascribed. Sometimes the roots of the bryony were employed instead of those of the mandrake, and sold under the name of *mandrake root.* From the most ancient times, aphrodisiac virtues have been ascribed to the mandrake, which was therefore supposed to cure barrenness. See Gen. xxx. 14–16. The same reputation has been attached in America to the berries of the

nearly allied genera, *himeranthus* and *jaborosa*. Many fables connected with the mandrake are recorded by ancient and mediæval writers.

MANDRIL. See BABOON.

MANDU', an extensive deserted city of India, in the state of Dhar, in Malwa, in lat. 22° 20′ n., long. 75° 27′ east. The circumference of the ramparts is said to be 37 miles. The greatest and least injured of the ruined buildings is the jama masjit, or great mosque, the area of which is raised several yards above the ground, and is reached by a handsome flight of stairs. The mausoleum of Hoshung Ghori, king of Malwa, is a massive building of white marble. According to Malcolm, Mandu was founded 313 A.D.

MANDU'RIA (formerly *Castel-Nuova*), a t. in the Italian provence of Lecce, 20 m. e. of Taranto. Pop. '72, 7,948. It has two celebrated wells, one of which has been minutely described by Pliny, and is remarkable for the unalterable level of its waters. Near to it stood the ancient town of Manduria, of which some important relics are still extant.

MANEE'SA. See MANISSA, *ante*.

MANÉS. See LARES.

MA'NES. See MANI; MANICHÆANS; *ante*.

MAN'ETHO, a celebrated Egyptian historian, native of Sebennytus, and of the sacerdotal order, flourished in the reign of Ptolemy. According to some, he was priest of Diospolis or Heliopolis; others contend that he was high-priest of Alexandria. His name has been interpreted "beloved of Thoth;" in the *song* of Lagos and Ptolemy Philadelphus, *Mai en tet*, or *Ma net*, "beloved of Neith;" but both interpretations are doubtful. Scarcely anything is known of the history of Manetho himself, and he is more renowned for his Egyptian history than on any other account. On the occasion of Ptolemy I. dreaming of the god Serapis at Sinope, Manetho was consulted by the monarch, and in conjunction with Timotheus of Athens, the interpreter of the Eleusinian mysteries, declared the statue of Serapis, brought by orders of the king from Sinope, to be that of the god Serapis or Pluto, and the god had a temple and his worship inaugurated at Alexandria. The fame of Manetho was much increased by his writing in the Greek language, and so being enabled to communicate from Egyptian sources a more correct knowledge of the history of his native country than his Greek predecessors. Of this history, only extracts given by Josephus in his work against Apion, and an epitome by Eusebius and other ecclesiastical writers, remain. It appears to have been drawn up in a compendious annalistic style of narrative, resembling the accounts given by Herodotus. The work of Manetho was divided into three books, the first beginning with the mythic reigns of gods and kings, and ending with the 11th dynasty of mortals; the second book continued the history from the 12th to the 19th dynasty; and the third from the 20th to the 30th dynasty, when Egypt fell under the dominion of Alexander the great. The reigns of the gods are given as amounting to 24,900 years, and the epoch of Menes, the founder of the monarchy, commenced 3,555 years before Alexander (332 B.C.). The difficulties attending the reconcilation of this chronology with the synchronistic history of the Hebrews, Greeks, and other nations, have given rise to numerous speculations and chronological systems since the revival of learning, by Scaliger, Freret, Marsham, Usher, Bunsen, Böckh, Lepsius, Poole, and others. The confusion in which the lists of kings have been transmitted, the ciphers of the lengths of each reign not agreeing with the summations of the durations of the dynasties, and these, again, differing from the total period assigned to the existence of the Egyptian monarchy, has given rise to two or three schools of chronology. The so-called long chronology, which supposes, with Scaliger and Böckh, that the 30 dynasties followed consecutively one after the other, has elevated the epoch of Menes to 5,702 B.C. The short chronology, or that which endeavors to square the dates of Manetho with the Hebrew chronology, or 4004 B.C. for the year of the world, on the contrary, assumes that several of the dynasties were contemporary, and that some intervals, such as that of the rule of the shepherd-kings, have been either exaggerated or misunderstood. The accession of newer and better information from the original sources of Egyptian monuments, papyri, and other documents, has considerably enhanced the general value of the history of Manetho, which, prior to their discovery, had fallen into discredit. But the restoration of the history of Manetho, notwithstanding all these resources, and the positive epoch of the monarchy, are still to be sought, although certain dynasties, in the 2d and 3d books of his work, can be reconciled with monumental evidence. Besides the true work of Manetho above cited, which he appears to have written in the reign of Ptolemy I., or II., another work, called *Sothis*, or the *Dogstar*, in allusion to the cycle of the heliacal rising of that star of 1461 years, and dedicated to Sebastos or Augustus, the title of the Roman emperors, and not found in use before that period, has been handed down. This work seems to have been added by the epitomizers; and another work called the *Old Chronicle*, in which the history was arranged according to cycles, was compiled by them. Besides the history, Manetho wrote *Tôn Physikôn Epitome* (Epitome of Physics), treating on the origin of gods and the world, and the laws of morality; and another work on the preparation of the

sacred *kyphi*, a kind of frankincense or aromatic food. The astronomical work called *Apotelesmata* is a spurious production of the 5th c. A.D.

Suidas, *voce* Manetho; Josephus *Contr. Apion*, i. 3, 9; Bunsen, *Ægyptens Stelle*, Bd. ii.; Fruin, *Manethon. Reliq.* (8vo. Leyd. 1847); Böckh, *Manetho* (8vo. Berlin, 1845).

MANEUVER, a French word, signifying "handy-work," is somewhat vaguely used in English military and naval language to denote collateral movements, not openly apparent, of bodies of men or squadrons of ships, by which an enemy is coerced, or by which it is sought to compel him to take some course adverse to his interests.

MANFRED, king of Naples and Sicily, a rare example of heroic fortitude and disinterestedness, was a natural son of the emperor Frederick II. by Blanca, the daughter of count Bonifacius Lanzia, and was b. about 1231. On his father's death, in 1250, he received the principality of Tarentum, and in the absence of his half-brother, Konrad IV., acted as regent in Italy. Notwithstanding Konrad's dislike to him, Manfred, with unexampled fidelity, bravely defended his sovereign's interests against the machinations of pope Innocent IV.; and after Konrad's death, which the pope accused him of having caused, he was acknowledged as regent of Apulia, in name of his nephew Konradin (q.v.). The pope, however, renewed his pretensions to Apulia, and compelled Manfred to flee for shelter to the Saracens, by whose aid he defeated the papal troops at Foggia, on Dec. 2, 1254, and again obtained possession of Apulia, to which he soon afterwards added Calabria. The new pope, Alexander IV., caused a crusade to be preached against him, but Manfred, steadily pursuing his victorious career, became, in 1257, master of the whole kingdom of Naples and Sicily. On the rumor of Konradin's death he was crowned king at Palermo, Aug. 11, 1258, and immediately afterwards was excommunicated by the pope, along with his adherents, among whom were the first prelates of the kingdom; but Manfred invaded the papal dominions, levied heavy contributions from them, and made himself master of the whole of Tuscany. His power now seemed secure, and his government was at once mild and vigorous; he founded many schools, built towns and harbors, and labored in many ways for the improvement of his kingdom. But this tranquillity was not of long duration. Pope Urban IV. renewed the excommunication against him and his friends, and bestowed his dominions as a papal fief on Charles of Anjou, the brother of Louis IX. of France. Manfred, though at first successful in the war which ensued, was at last treacherously defeated, and slain in a bloody battle at Benevento, Feb. 26, 1266. His widow and children were savagely treated by the French, the daughter being confined for 18 and the sons for 31 years. His body was found some days after and interred as that of an excommunicated person; but the people, and even the French soldiers, heaped up stones for a monument, which received the name of the Rock of Roses.

MANFREDO'NIA, a city of Italy, in the province of Foggia, 26 m. n.e. of the city of Foggia, founded by Manfred (q.v.), king of Naples and Sicily, from the ruins of ancient Sipontum; pop. '72, 7,574. It is strongly walled, and an imposing castle protects its port. In the vicinity of Manfredonia are remarkable salt lakes—the *Pontano Salso* and the *Lago di Salpi*—the beds of which, during the summer heats, are thickly incrusted with salt.

MANFREDONIA, GULF OF (*Sinus Urias*), an inlet of the Adriatic, which washes the Neapolitan provinces of Bari and Capitanata, 15 m. in length and 30 in breadth.

MANGALORE', a sea-port in the district of Canara, in the presidency of Madras, lat. 12° 52′ n. In former times the harbor was good and the town prosperous, but within the present century it has become, to a great extent, silted up. Pop. (including seven villages in the vicinity) '71, 29,712. The cantonment on the north side of the town is healthy, being elevated, well drained, and open to the breezes from the sea.

MAN'GANESE (symb. Mn, equiv. 27.6; new system, 55—spec. grav. 8) is one of the heavy metals of which iron may be taken as the representative. It is of a grayish-white color, presents a metallic brilliancy, is capable of a high degree of polish, is so hard as to scratch glass and steel, is non-magnetic, and is only fused at a white heat. As it oxidizes rapidly on exposure to the atmosphere, it should be preserved under naphtha.

It occurs in small quantity, in association with iron, in meteoric stones; with this exception it is not found native. The metal may be obtained by the reduction of its sesquioxide by carbon at an extreme heat.

Manganese forms no less than six different oxides—viz., protoxide (MnO), sesquioxide (Mn_2O_3), the red oxide (Mn_3O_4), the binoxide or peroxide (MnO_2), manganic acid (MnO_3), and permanganic acid (Mn_2O_7). The *protoxide* occurs as an olive-green powder, and is obtained by igniting carbonate of manganese in a current of hydrogen. Its salts are colorless, or of a pale rose color, and have a strong tendency to form double salts with the salts of ammonia. The carbonate forms the mineral known as manganese spar. The sulphate is obtained by heating the peroxide with sulphuric acid till there is faint ignition, dissolving the residue in water, and crystallizing. It is employed largely in calico-printing. The silicate occurs in various minerals.

The *sesquioxide* is found crystallized in an anhydrous form in *braunite*, and hydrated in *manganite*. It is obtained artificially as a black powder by exposing the peroxide to

a prolonged heat. When ignited it loses oxygen, and is converted into red oxide. Its salts are isomorphous with those of alumina and sesquioxide of iron. See ISOMORPHISM. It imparts a violet color to glass, and gives the amethyst its characteristic tint. Its sulphate is a powerful oxidizing agent.

The *red oxide* corresponds to the black oxide of iron. It occurs native in *hausmannite*, and may be obtained artificially by igniting the sesquioxide or peroxide in the open air. It is a compound of the two preceding oxides.

The *binoxide*, or *peroxide*, is the black manganese of commerce and the *pyrolusite* of mineralogists, and is by far the most abundant of the manganese ores. It occurs in a hydrated form in *varvicite* and *wad*. Its commercial value depends upon the proportion of chlorine which a given weight of it will liberate when it is heated with hydrochloric acid, the quantity of chlorine being proportional to the excess of oxygen which this oxide contains over that contained in the same weight of protoxide. The reaction is explained by the equation—

Binox. Mang.		Hyd. Acid.		Chlor. of Mang.		Water.		Chlorine.
MgO_2	+	2HCl	=	MgCl	+	2HO	+	Cl

When mixed with chloride of sodium and sulphuric acid it causes an evolution of chlorine, the other resulting products being sulphate of soda and sulphate of protoxide of manganese, as shown in the equation—

$$NaCl+MnO_2+2SO_3=NaO,SO_3+MnO,SO_3+Cl.$$

When mixed with acids it is a valuable oxidizing agent. It is much used for the preparation of oxygen (q.v.), either by simply heating it, when it yields 12 per cent of gas, or by heating it with sulphuric acid, when it yields 18 per cent. Besides its many uses in the laboratory, it is employed in the manufacturing of glass, porcelain, etc.

Manganic acid is not known in a free state. Manganate of potash is formed by fusing together hydrated potash and binoxide of manganese. The black mass which results from this operation is soluble in water, to which it communicates a green color, due to the presence of the manganate. From this water the salt is obtained *in vacuo* in beautiful green crystals. On allowing the solution to stand exposed to the air it rapidly becomes blue, violet, purple, and finally red, by the gradual conversion of the manganate into the permanganate of potash; and on account of these changes of color the black mass has received the name of *mineral chameleon*.

Permanganic acid is only known in solution or in a state of combination. Its solution is of a splendid red color, but appears of a dark violet tint when seen by transmitted light. It is obtained by treating a solution of permanganate of baryta with sulphuric acid, when sulphate of baryta falls and the permanganic acid remains dissolved in the water. Permanganate of potash, which crystallizes in reddish purple prisms, is the most important of its salts. It is largely employed in analytical chemistry, and is the basis of Condy's disinfectant fluid.

Manganese is a constituent of many mineral waters, and is found in small quantity in the ash of most vegetable and animal substances. It is almost always associated with iron.

Various preparations of manganese have been employed in medicine. The sulphate of the protoxide, in doses of one or two drams, produces purgative effects, and is supposed to increase the excretion of bile; and, in small doses, both this salt and the carbonate have been given with the intention of improving the condition of the blood in cases of anæmia. Manganic acid and permanganate of potash are of great use when applied in lotions (as in Condy's fluid diluted) to foul and fetid ulcers. In connection with the medicinal applications of manganese, it may be mentioned that manganic acid is the agent employed in Dr. Angus Smith's celebrated test for the impurity of the air.

MANGE, in horses, dogs, and cattle, and scab in sheep, are diseases very similar to itch in the human subject, resulting from the attacks of minute mites, or *acari*, which burrow in the skin, especially if it be dirty or scurfy, cause much irritation, heat, and itching, and the eruption of minute pimples, with dryness, scurfiness, baldness, and bleaching of the skin. The treatment consists in destroying the *acari* and insuring the cleanliness and health of the skin, both of which objects are effected by washing the parts thoroughly every second day with soft soap and water, and dressing daily with sulphur or mild mercurial ointments, or with a solution containing four grains either of corrosive sublimate or arsenic to the ounce of water. Castor-oil seeds, bruised and steeped for twelve hours in buttermilk, are very successfully used by the native Indian farriers. Where the heat and itching are great, as is often the case in dogs, a few drops of tincture of belladonna may be used to the usual dressing, or applied along with a little glycerine. Where the general health is indifferent, as in chronic cases, the patient should be liberally fed, kept clean and comfortable, have an occasional alterative dose of any simple saline medicine, such as niter or common salt, and a course of such tonics as iron or arsenic. Cleanliness and occasional washing and brushing maintain the skin in a healthy state, and thus prevent its becoming a suitable nidus for the *acari*.

MANGEL WURZEL. See BEET; MANGOLD WURZEL, *ante*.

MANGLE, a machine for smoothing linen and cotton goods, such as table-cloths, sheets, etc., after washing. It has been much improved since the first rude invention, but does not supersede the sad-iron for the finer kinds of work.

MANGLES, JAMES, 1785–1861; b. England; entered the British navy in 1800, and was made a commander in 1815. The next year he went down the Nile, and made excavations at the temples in Ipsambool. He returned to England in 1820, by way of Syria. A collection of letters, written by him and his traveling companion, commander Charles Leonard Irby, was printed for private circulation in 1823, and given to the public in 1844, as *Travels in Egypt and Nubia, Syria, and the Holy Land.*

MANGO, *Mangifera*, a genus of trees of the natural order *anacardiaceæ*, having flowers with four or five petals, five stamens, of which the greater part are generally sterile, one ovary seated on a fleshy disk, the fruit a fleshy drupe. The COMMON MANGO (*M. Indica*) is a native of India. It is a spreading tree of rapid growth; 30 to 40 ft. in height, the stem only rising 8 to 10 ft. before it divides into branches; the foliage so dense as to be impenetrable to the burning rays of the sun, affording a most grateful shade; the leaves lanceolate, entire, alternate, stalked, smooth, shining, leathery, and about 7 or 8 inches long, with a sweet resinous smell. The flowers are small, reddish-white or yellowish, in large erect terminal panicles; the fruit is kidney-shaped, smooth, varying considerably in size and color, and containing a large flattened stone, which is covered on the outside with fibrous filaments, longest and most abundant in the inferior varieties, some of which consist chiefly of fiber and juice, whilst the finer ones have a comparatively solid pulp. The fruit of some of the varieties in cultivation is as large as a man's fist. The mango is much prized for the dessert; it is luscious and sweet, with slight acidity. It was introduced into Jamaica in 1782, and is now very generally cultivated in tropical and subtropical countries. The unripe fruit is made into tarts and pickles. Mango kernels are nutritious, and have been cooked for food in times of scarcity. The tree is raised from seeds; the finer varieties are propagated by layering and inarching, and trees obtained in this way often bear much fruit without attaining a large size. There are several other species of mango, natives of different parts of the east, but the fruits of all of them are very inferior.

MANGO FISH, *Polynemus paradiseus*, a fish which inhabits the bay of Bengal, and ascends the Ganges and other rivers to a considerable distance. It is accounted one of the most delicious fishes of India, but is particularly esteemed when salted and prepared in a peculiar manner, when it bears the name of *burtah*. The name mango fish is given to this fish from its beautiful yellow color, resembling that of a ripe mango. Another Indian name is *tupsee*. It is of a perch-like form, and belongs to a genus formerly referred to the perch family (*percidæ*), but now the type of a distinct family (*polynemidæ*), having the ventral fins behind the pectorals, although partially attached to the bones of the shoulder, and the lower rays of the pectorals extended into threads, which in the mango fishes are twice the length of the body. The mango fish is seldom more than 8 or 9 in. in length. The genus *polynemus* contains a number of species of tropical fishes, the air-bladders of some of which are of importance as isinglass; those of *P. Indicus*, a fish sometimes 20 lbs. weight, and other species, forming a considerable article of export from Singapore, under the name of *fish-maws*.

MAN'GOLD-WURZEL (Ger. beet-root), or MANGOLD (Ger. beet), a name in general use in Britain and America, to designate the varieties of the common beet (q.v.) cultivated in fields for the feeding of cattle. By mistake the name was at first written *mangel-wurzel*, and this erroneous form is still sometimes used. The field-beets differ from the garden-beets chiefly in being larger in all their parts, and coarser. They have large roots, which in some of the varieties are red, in some greenish or whitish, in some carrot-shaped, and in some nearly globular. The cultivation of mangold-wurzel as a field-crop was introduced into England in 1786, but it is only of late that it has much extended. At first, so little was its value known, that the leaves alone were used as food for cattle. Its importance, however, was soon appreciated, and it rapidly gained favor. It is much more patient of a high temperature than the turnip, liable to fewer diseases, and vastly more productive under liberal treatment. In the island of Jersey, and in highly manured grounds in the vicinity of London, as much as from 70 to 80 tons to the acre have been raised. Throughout the south of England it is generally admitted that it is as easy to grow 30 tons of mangold-wurzel to the acre as 20 tons of Swedish turnips. The lower temperature of Scotland, however, does not admit of the crop being raised to the same advantage. The yield is much smaller than in the south, and the plants are more liable to run to flower. This seems to be owing to the cold contracting the vessels, and in some measure acting in the same manner as a diminished supply of food in favoring the formation of seed. The increased precariousness of the turnip-crop of late years, however, has induced many to make trial of the cultivation of mangold-wurzel, and with considerable success. The mode of culture does not vary materially from that followed in Scotland in raising turnips. The land in which the crop is to be planted receives a deep furrow in autumn; and if it is quite free from perennial weeds, it is often previously well manured. Drills or ridges, from 20 to 30 in. wide, are formed in spring by the doubled-molded plow; and if manure has not been applied in autumn, from 20 to 30 loads are spread along the furrows. In addition, from 3 to 4 cwts. of guano, and 4

cwts. of ammonia salt, are sown broadcast over the drills; indeed, this crop can rarely be over-manured. The manures are then covered by the plow, and the ridges are afterwards run over with a light roller, to smooth them down. Two or three seeds are then dibbled in on the tops of the ridges, from 1 ft. to 1½ ft. apart. It requires about 7 lbs. of seed to the acre; and as the grains are inclosed in a hard and rough coat, they may be moistened in water for two days previous to their being planted, for the purpose of promoting a quick and regular braird. The long red, the round red, and the round green-topped yellow are all favorite varieties in England. As soon as the plants are about 3 in. above ground, they are singled out by the hand, and their cultivation is afterwards the same in all respects as in the case of Swedish turnips. The crop is usually ready to be taken up by the end of October; indeed, it should not be delayed beyond this period, for, being a native of the warm coasts of the Mediterranean, it is injured by severe frost. The leaves are wrenched off by the hand, and the earth is merely roughly taken away from the roots, as they do not keep well through the winter if cut or bruised. The roots are stored in pits or clamps, covered with straw and a little earth, as a protection in severe weather. It is some time after storing before the roots can be used with advantage; for in autumn and the early part of winter, its juices being unripened, have a laxative effect on animals. Swedish turnips are at this season preferred for feeding; but the harshness of the mangold-wurzel wears off by spring, and it then becomes an excellent food for stock of all kinds, and if well kept, retains its juiciness till the middle of summer.

MAN'GON, or MAN'GONEL. See BALISTA.

MAN'GOSTAN, *Garcinia mangostana*, one of the most delicious of all fruits, produced by a tree of the natural order *guttiferæ* or *clusiaceæ*, a native of the Molucca islands. The tree is in general only about 20 ft. high, but of beautiful appearance, having an erect tapering stem and a regular form, somewhat like that of a fir; the leaves 7 or 8 in. long, oval, entire, leathery, and shining; the flowers are large, with corolla of 4 deep red petals. The fruit, in size and shape, resembles an orange; it is dark brown, spotted with yellow or gray, has a thick rind, and is divided internally by thin partitions into cells. The pulp is soft and juicy, of a rose color, refrigerant and slightly laxative, with a mixture of sweetness and acidity, and having an extremely delicate flavor. It may be eaten very freely with perfect safety, and is esteemed very beneficial in fevers. The mangostan is cultivated in Java and in the s.e. of Asia; it has recently become common in Ceylon, and has been successfully introduced into some other tropical countries.

MANGOUSTE, or MONGOUS. See ICHNEUMON, *ante*.

MAN'GROVE, *Rhizophora*, a genus of plants of the natural order *rhizophoraceæ*. This order consists of trees and shrubs, all tropical and natives of coasts, particularly about the mouths of rivers, where they grow in the mud, and form a close thicket down to and within the marge of the sea, even to low-water mark. Most of the species send down roots from their branches, and thus rapidly extend over large spaces, forming secure retreats for multitudes of aquatic birds, whilst crabs are also to be found in them in vast numbers, and shell-fish are attached to the branches. The order is distinguished by simple, opposite leaves, with convolute deciduous stipules between the leaf-stalks; the ovary 2 to 4 celled, each containing two or more ovules; the fruit not opening when ripe, crowned with the calyx, 1-celled, 1-seeded. The seeds have the peculiarity of germinating whilst still attached to the parent branch, a long thick radicle proceeding from the seed, piercing its covering, and extending rapidly downwards, till the fruit falls off, when it is soon imbedded in the mud, into which its form, club-like, the heavy end downwards, secures that it shall penetrate in a right position. The whole number of species known is only about 20; the wood of some is hard and durable. The fruit of the common mangrove (*rhizophora mangle*) is sweet, eatable; and its juice, when fermented, yields a light wine. The bark of the common mangrove is sometimes imported into Britain for the use of tanners, but it is only of second-rate quality.

MANGUM, WILLIE PERSON, 1792–1861; b. Orange co., N. C.; graduated at the North Carolina university in 1815; was a successful lawyer and whig politician; elected a judge of the superior court in 1819 and 1826; was a member of congress 1823–26, and U. S. senator 1831–37 and 1841–53. He was president of the senate during the administration of John Tyler. In 1837 he received 11 electoral votes for president of the United States.

MANHATTAN ISLAND. See NEW YORK.

MANHEIM. See MANNHEIM, *ante*.

MANI, MANES, MANICHÆUS (entitled *Zendik*, Sadducee), the founder of the heretical sect of the Manichæans (q.v.), who lived in the 3d c., A.D. Little is known with regard to his early history, and the accounts transmitted through two distinct sources—the western or Greek, and the eastern—are legendary and contradictory on almost every important point. According to certain—very dubious—acts of a disputation held between Manes and Archelaus, bishop of Cascar (?), he was first called Curbicus, and was bought as a slave, at the age of seven years, by the wife of one Ctesiphon, in Babylonia, who gave him a good education, and at her death made him sole heir. Among the books

she left him, he is said to have found the writings of Scythianus, which had been given to her by one of the latter's disciples named Terebinthus, or *Budda*. Mani emigrated into Persia, where he remained up to his sixtieth year, and changed his former name, so as to obliterate all traces of his origin and former state. Here he also became acquainted with the New Testament and other Christian works; and gradually conceived the idea of amalgamating the Magian with the Christian religion, and of adding what he knew of Buddhism to the new faith. For the better carrying out of this plan, he announced that he was the paraclete promised by Christ. King Sapor I. of Persia, in whose days he first proclaimed his mission, at first looked not unfavorably upon his proceedings; but when he had failed to heal the prince, his son, he was cast into prison, whence he managed to escape, but, pursued and captured, he was publicly executed. According to other accounts, however, Mani was the scion of a noble Magian family, and a man of extraordinary mental powers, and artistic and scientific abilities—an eminent painter, mathematician, etc.—embraced Christianity in early manhood, and became presbyter at a church in Ehvaz or Ahvaj, in the Persian province of Hazitis, gave himself out to be the paraclete, and styled himself in ecclesiastical documents "Mani, called to be an apostle of Jesus Christ through the election of God the Father." Persecuted by king Sapor I., he sought refuge in foreign countries, went to India, China, and Turkistan, and there lived in a cave for 12 months, during which he is said to have been in heaven. He reappeared with a wonderful book of drawings and pictures, called Erdshenk or Ertenki-Mani. After the death of Sapor (272 A.D.), he returned to Persia, where Hormuz, the new king, who was well inclined towards him, received him with great honors, and in order to protect him more effectually against the persecutions of the Magi, gave him the stronghold of Deshereh, in Susiana, as a residence. After the death of this king, however, Behram, his successor, entrapped Mani into a public disputation with the Magi, for which purpose he had to leave his castle; and he was seized upon, flayed alive, and hung before Djondishapur, 277 A.D. For his doctrine, etc., see MANICHÆANS.

MANIA is the form of mental derangement most familiar to ordinary observers. The excitement and violence by which it is sometimes characterized have become, erroneously and unfortunately, the type and standard by which the disease and those subject to it have been recognized and treated. These qualities occasionally involved danger to those around, and were always calculated to inspire fear; so that for centuries they were counteracted by repression, coercion, and harshness. It is worthy of remark that contemporaneously with the establishment of confidence, and with the introduction of a humane system of treatment, the fury and formidable pugnacity of the insane to a great degree disappeared. This effect, must, however, in part be referred to that change of type in the nature of the malady itself which is supposed to depend upon a modification in the human constitution, as well as upon external circumstances, and which has been observable in all affections of an inflammatory character since the beginning of the present century. The discontinuance of restraint, and the cessation of the necessity for such a measure in asylums, whether regarded as protective or remedial, may be accepted as a proof of the reality and extent of this change, upon whatever it may depend. It is, moreover, probable that, by the accuracy of modern diagnosis, cases of wild frenzy, depending upon fever or inflammation of the brain, have been distinguished from those of true mania, and its true features thus better determined. These are loss of appetite, general uneasiness and irritation, watchfulness, headache, restlessness, intense stimulation of the passions and propensities, rapid ideation, incoherence and loquacity, violence or unbridled agitation and extravagance; and, as the disease advances, emaciation, hollowness of the cheeks and eyes, discoloration of the skin, brilliancy and fixity of eyes. However similar these symptoms may be to what are seen in the fevered and the phrenetic, great caution must be exercised in concluding that the circulation is involved directly, or at all, for of 232 cases examined by Jacobi, 23 only presented any indications of fever, and in these this condition was attributable to hectic and other causes unconnected with mania. Esquirol rarely mentions the pulse as affording any guidance in this kind of alienation. The true interpretation of these symptoms appears to be that they are connected with debility and exhaustion; that although, remotely, they may originate in any organ or condition, they proximately depend upon impaired nutrition and irritation of the nervous system, calling for support, stimulation, calm, and repose, alike moral and physical. The classification of the various aspects under which mania occurs has been so far regulated by the bodily affection with which it is complicated or associated. Epileptic mania, the most furious and formidable, and puerperal mania, perhaps the most intractable species, consist in the superaddition of the indications formerly detailed to certain states of the nervous system, and to that of parturition. Whatever the combination or complication, however, the essential psychical characteristic of mania is that all mental powers are involved, and are thrown into a state of exaltation and perversion. When the initiatory extravagance and excitement have subsided, when the affection has become chronic, delusions, previously existing, become prominent, and impart a predominating complexion to the condition. It is probable that, wherever delusions or hallucinations are detected, although they may seem solitary deviations from health, there is a broader and deeper substratum of disease, of which they are trivial manifestations; and where mania has ushered in such affections, the original disease may be held to remain while they remain, and to be reacted upon, and,

under certain circumstances, roused into activity through their instrumentality. In these views may be found an explanation of those partial mental derangements which appear to co-exist with health.—Bucknill and Tuke, *Psychological Medicine—Sketches in Bedlam.*

MANIA. See INSANITY.

MANICA, a small state of s.e. Africa, in the territory of Monomotapa, but tributary to the Portuguese. It is a mountainous region, and produces gold and copper, which, with ivory, form the chief articles of export, and are exchanged with the Portuguese for silk, linen, and iron. Many parts are fertile, affording pasturage for large herds of cattle.

MANICHÆANS, a religious sect, founded by Mani (q.v.), which, although it utterly disclaimed being denominated Christian, yet was reckoned among the heretical bodies of the church. It was intended to blend the chief dogmas of Parsism, or rather Magism, as reformed by Zoroaster, with a certain number of Buddhistic views, under the outward garb of biblical, more especially New Testament history, which, explained allegorically and symbolically, was made to represent an entire new religious system, and one entirely at variance with Christianity and its fundamental teachings. The Manichæans assumed, above all, two chief principles, whence had sprung all visible and invisible creation, and which—totally antagonistic in their natures—were respectively styled the Light, the Good, or God, and the Darkness, the Bad, Matter, or Archon. They each inhabited a region akin to their natures, and excluding each other to such a degree that the region of darkness and its leader never knew of the existence of that of the light. Twelve æons—corresponding to the twelve signs of the zodiac and the twelve stages of the world—had sprung (emanated) from the primeval light; while "darkness," filled with the eternal fire, which burned but shone not, was peopled by "demons," who were constantly fighting among themselves. In one of these contests, pressing towards the outer edge, as it were, of their region, they became aware of the neighboring region, and forthwith united, attacked it, and succeeded in carrying the ray of light that was sent against them at the head of the hosts of light, and which was the embodiment of the ideal or primeval man (Christ), captive. A stronger æon, however (the Holy Ghost), hurried to the rescue, and redeemed the greater and better part of the captive light (Jesus impatibilis). The smaller and fainter portion, however (Jesus passibilis), remained in the hands of the powers of darkness, and out of this they formed, after the ideal of *The Man of Light*, mortal man. But even the small fraction of light left in him (broken in two souls) would have prevailed against them, had they not found means to further divide and subdivide it by the propagation of this man (Eve—sin). Not yet satisfied, they still more dimmed it by burying it under dark "forms of belief and faith, such as paganism and Judaism." Once more, however, the original light came to save the light buried in man, in the person of Christ, descending from the sun, with which he is one. The demons succeeded, however, in cutting his career of salvation short by seducing man to crucify him. His sufferings and death were naturally only fictitious, since he could not in reality die; he only allowed himself to become an example of endurance and passive pain for his own, the souls of light. Since, however, even his immediate adherents, the apostles, were not strong enough to suffer as he had bid them, he promised them a paraclete, who should complete his own work. This paraclete was Mani, who surrounded himself, like Christ, with twelve apostles, and sent them into the world to teach and to preach his doctrine of salvation. The end of the "world" will be fire, in which the region of darkness will be consumed and utterly annihilated. To attain to the region of eternal light, it is necessary that passion, or rather the body, should be utterly subdued; hence rigorous abstinence from all sensual pleasures, asceticism, in fact, to the utmost degree, is to be exercised. The believers are divided into two classes, the elect and the auditors. The elect have to adhere to the *Signaculum, Oris, Manus,* and *Sinus*, that is, they have to take the oath of abstinence from evil and profane speech (including "religious terms such as Christians use respecting the Godhead and religion"), further, from flesh, eggs, milk, fish, wine, and all intoxicating drinks (cf. Manu, *Instit.* vv. 51, 52, 53: "He who makes the flesh of an animal his food . . . not a mortal exists more sinful . . . he who . . . desires to enlarge his own flesh with the flesh of another creature," etc.); further, from the possession of riches, or, indeed, any property whatsoever; from hurting any being—animal or vegetable; from heeding their own family, or showing any pity to him who is not of the Manichæan creed; and finally, from breaking their chastity by marriage or otherwise. The auditors were comparatively free to partake of the good things of this world, but they had to provide for the subsistence of the elect, and their highest aim also was the attainment of the state of their superior brethren. In this Manichæan worship, the visible representatives of the light (sun and moon) were revered, but only as representatives of the ideal, of the good or supreme God. Neither altar nor sacrifice was to be found in their places of religious assemblies, nor did they erect sumptuous temples. Fasts, prayers, occasional readings in the supposed writings of Mani, chiefly a certain *Fundamental Epistle*, were all their outer worship. The Old Testament they rejected unconditionally: of the New Testament they retained certain portions, revised and redacted by the paraclete. (August. c. Faust., book xviii.; cf. book ix.). Sunday, as the day on which the visible universe was to be consumed, the day consecrated to the sun, was kept as a great festival; and the most solemn day in their year was the anniversary of the death of Mani.

Baptism and the Lord's supper were celebrated as mysteries of the elect. Of this mode of celebration, however, we know next to nothing; even Augustine, who for about nine years belonged to the sect, and who is our chief authority on this subject, confesses his ignorance of it. As to the general morality of the Manichæans, we are equally left to conjecture; but their doctrine certainly appears to have had a tendency, chiefly in the case of the uneducated, to lead to a sensual fanaticism hurtful to a pure mode of life.

The outward history of the sect is one of almost continuous persecution. Diocletian, as early as 296 A.D., issued rigorous laws against them, which were reiterated by Valentinian, Theodosius I., and successive monarchs. Notwithstanding this, they gained numerous adherents; and very many mediæval sects, as the Priscillians, Katharenes, Josephinians, etc., were suspected to be secretly Manichæans. Italy, the south of France, Spain, and even Germany, were the successive seats of this sect, which did not disappear entirely until the time of the reformation.

MANIFES'TO, a public declaration issued by a sovereign prince or by a government on some state emergency, expressive of intentions, opinions, or motives. Immediately before entering on a war, a manifesto is issued containing a statement of the reasons which have been held to justify the sovereign or government in taking up arms. In case of a revolt, a manifesto is sometimes issued to recall subjects to their allegiance.

MANIGAULT, GABRIEL, 1704–81; b. S. C., of Huguenot parentage; became a merchant, acquired great wealth, and in the beginning of the war of independence loaned to the state of South Carolina the sum of $220,000. In 1779, when Prevost attacked Charleston, Manigault, at 75 years of age, with a grandson but 15 years old at his side, was among the volunteers who defended the city.

MANIL'A HEMP. See ABACA, *ante.*

MANIL'A, the capital of the Philippine islands (q.v.), and residence of the Spanish viceroy, or governor of the Philippine archipelago, is situated in the island of Luzon, on the banks of the river Pasig, and at the embouchure of that river in the bay of Manila. It is divided by its river into Manila proper and Binondo. Manila proper, or the *city* of Manila, consisting of 17 spacious streets, crossing at right angles, contains the cathedral; the *palacio,* built in 1690; the archiepiscopal palace, the hall of audience, 11 churches and 3 convents, besides public offices, barracks and other military establishments. Beyond the ramparts, on the east side, is the calzada, or public promenade, crowded in the evening by carriages and equestrians. Instead of glazed windows, the houses are furnished with sliding frames, fitted with plates of semi-transparent oyster-shells. Binondo is larger and more animated than Manila; but the streets are less regular, and many still unpaved. Numerous canals intersect this suburb, which is the residence of the wealthy merchants. The bay and harbor of Manila are magnificent, and the Pasig is navigable for 10 miles. The trade is chiefly with the United States, Great Britain, China, and Australia. Manila is by law the only emporium of foreign trade with the Spanish East Indies. Its principal exports are sugar, abaca (Manila hemp), cigars, leaf tobacco, coffee, rice, and fine woods. The imports consist chiefly of woven goods from Manchester and Glasgow, with lead, iron-ware and beer; silks, nankins, vermilion, and curiosities are imported from China. The cheeroots of Manila are famous; they are generally preferred to those of Havana everywhere east of the cape of Good Hope. Their manufacture is under the charge of an administration whose headquarters are at Manila; 20,000 persons are employed in this branch of manufacture. The climate of Manila is on the whole healthy, and the average temperature throughout the year is nearly 82°. Convulsions of the earth have frequently made frightful ravages in this city. In 1824, many churches, private houses, etc., were destroyed, and the ships in the harbor were wrecked, but the number of victims was never ascertained. In 1828 and 1857, severe shocks were felt; but on June 3, 1863, one of the most dreadful earthquakes almost ruined the city. The cathedral and all the churches, with one exception, were overthrown; the palace of the viceroy and the British consulate were destroyed; and a number of lives, of which 2,000 seems but a moderate estimate, were lost. On Oct. 30, 1875, a violent hurricane killed 250 persons, and destroyed 3,800 houses. Manila is one of the four ports of the Philippine archipelago which are open to foreign vessels. In 1874 the value of the exports from Manila was $15,889,817 (about £3,178,000); and that of imports from Great Britain was £873,435. Pop., including suburbs (1865), 230,443.

MANILIUS, MARCUS, lived, according to Bentley, who has edited his works, at about the time of Augustus; but both his name and identity are in great doubt, as well as his birthplace, which Bentley claims to have been in Asia; others in Rome. He is known only as the author of a poem called *Astronomica,* of which five books are extant treating of the fixed stars. Probably others on the planetary system have been lost or never completed. As an astronomer Manilius seems to have been somewhat in advance of his age, but as poetry his book has small value.

MANIN, DANIEL, an illustrious Italian patriot and political leader, elected, during the revolution of 1848, president of the Venetian republic. Born in 1804 at Venice, Manin graduated at the university of Padua, was admitted doctor of laws at 19, and subsequently practiced at the bar, of which his father, Pietro Manin, was an eminent mem-

ber. From 1831 he became a recognized leader of liberal opinion in Venice; in 1847 his reputation as a political economist was established during the sittings of the scientific congress at Venice; and shortly after he was thrown into prison for a spirited public address of which he was the author.

Previous to the outbreak of 1848, Manin was for the second time incarcerated; but on the promulgation of the news that Paris, Naples, and Tuscany were in revolution, he was released in triumph by the populace, and was at once invested with supreme power. The organization of a civic guard, and the expulsion of the Austrians from the arsenal, were Manin's first public measures; the mob that clamored for the lives of their former oppressors, shrunk back abashed at his dignified rebuke.

From the period of his election to the presidency of the Venetian republic, Manin's energies were devoted to the organization of the inhabitants for self-defense.

During the annexation of Lombardy to Piedmont, Manin laid down his authority; but on the defeat of the Sardinian army at Novara, Mar. 23, 1849, he resumed it, and was the animating spirit of the entire population of Venice during the heroic defense of the city for four months against the besieging Austrian army. On Aug. 24, Venice capitulated; but Manin, with 40 of the principal citizens, being excluded from all stipulations, quitted the city. He retired to Paris, where he taught his native language, declining innumerable offers of aid. From thence he proclaimed his desire that the republican system should give place in Italy to the Sardinian monarchy, or any executive form tending to get rid of Austrian rule. He died of heart-disease in Paris in Sept., 1857.

In this really great man appeared a rare union of qualities the most exalted, enthusiasm being guided by great practical sagacity; extreme personal humility coexisting with a lofty sense of authority, and great faculty for command; and the energy and fire of action being equaled by the calm and stoical endurance of defeat and mortal disease.

MA'NIOC, MANDIOC, or CASSAVA, *Manihot utilissima,* formerly known as *jatropha manihot,* and as *janipha manihot,* a large, half-shrubby plant of the natural order *euphorbiaceæ,* a native of tropical America, and much cultivated there. It is now also extensively cultivated in Africa, and has been introduced into other tropical countries. Manioc, or *mandioca,* is the Brazilian name; *cassava,* the West Indian; and in Peru and some other parts of South America, the name is *juca* or *yucca.* The plant grows in a bushy form, with stems usually 6 to 8 ft. high, but sometimes much more. The stems are white, brittle, and have a very large pith; the branches are crooked. The leaves are near the extremities of the branches, large, deeply 7-parted. The roots are very large, turnip-like, sometimes weighing 30 lbs., from three to eight growing in a cluster, usually from a foot to two feet long. In common with other parts of the plant, they contain an milky juice, so poisonous as to cause death in a few minutes; but as this is owing to the acrid presence of hydrocyanic acid, which is quickly dissipated by heat, the juice, inspissated by boiling, forms the excellent sauce called Casareep (q.v.); and fermented with molasses, it yields an intoxicating beverage called *ouycou;* whilst the root, grated, dried on hot metal plates, and roughly powdered, becomes an article of food, very largely used in South America, and there very generally known as *farinah* (Portug. meal). It is made into thin cakes, like the oat-meal cakes of Scotland, which are formed, however, not by mixing it with water, but by the action of heat softening and agglutinating the particles of starch. These cakes are sometimes called *cassava* or *cassada bread.* It is also imported into Britain, to be used in manufactories as starch. The true starch of manioc, separated in the ordinary manner from the fiber, is also imported in considerable quantity into Britain, under the name of *Brazilian arrow root;* and from it tapioca is made, by heating it on hot plates, and stirring with an iron rod; the starch-grains burst, some of the starch is converted into dextrine, and the whole agglomerates into small irregular masses. Another species or variety of manioc is also cultivated, the roots of which contain a perfectly bland juice, and are eaten raw, roasted or boiled. This, the SWEET CASSAVA or SWEET JUCA (*M. aipi* of some botanists, said to be a native of Africa as well as of America), is described as having the leaves 5-parted, and the root of longer shape than the common or bitter cassava, and much smaller, only about six ounces in weight; but other descriptions represent the sweet cassava as having roots quite equal in size to the bitter. The manioc is easily propagated by cuttings of the stem, and is of rapid growth, attaining maturity in six months. The produce is at least six times that of wheat.

MA'NIS, a genus of mammalia, of the order *edentata,* containing several species, natives of Africa and the warm parts of Asia, and in their habits and many of their characters closely resembling the ant-eaters (q.v.) of South America; but having, among other differences, the body and the tail covered with an armor of large sharp-edged and pointed scales. The species are pretty numerous. One, remarkable for the length of its tail, the *phattagen* of the ancients (*M. tetradactyla*), inhabits western Africa. It is about 5 ft. long, of which the tail occupies 3 feet.—Another, the SHORT-TAILED MANIS (*M. pentadactyla*), is common in many parts of the East Indies.

MAN, ISLE OF, is situated in the Irish sea, in n. lat. 54° 3′ to 54° 25′, and w. long. 4° 18′ to 4° 47′; the shortest distance between the island and the adjacent countries being from point of Ayre to Burrow head in Scotland, 16 miles. The length of the island is 33¼ m., breadth 12½ m., and area about 145,325 acres, of which more than 90,000 are cul-

tivated. At the south-western extremity is an islet called the Calf of Man, containing 800 acres, a large portion of which is under cultivation. A chain of mountains extends from n.e. to s.w., the highest of which is Snaefell, 2,024 ft. above the mean sea-level: from its summit, the view is very imposing; the picturesque glens and undulating country in the foreground; the rich plains of the n. and s. of the island in mid-distance; and beyond, the Irish sea, bounded by the high lands of the surrounding countries, on which even the corn-fields may be descried. Several streams take their rise in these mountains, in some of which trout abound, though in many the fish have been destroyed by the washings from the lead mines. The coast-scenery from Maughold head on the e., passing s. to Peel on the w., is bold and picturesque, especially in the neighborhood of the Calf, where Spanish head, the southern extremity of the island, presents a sea-front of extreme grandeur.

The greater part of the island consists of clay-slate under various modifications. Through the clay-schist, granite has burst in two localities, in the vicinity of which mineral veins have been discovered, and are extensively worked. Nearly 4,000 tons of lead are extracted annually, as well as considerable quantities of copper, zinc, and iron; the lead ore is very rich in quality, as much as 108 oz. of silver having been occasionally extracted from the ton.

The island is divided into 6 *sheadings;* these into parishes, of which there are 17; these, again, into *treens;* and, lastly, into *quarterlands.* The towns are Castletown (q.v.), Douglas, the modern capital (q.v.), Peel (q.v.), and Ramsey (q.v.).

Within the past few years great improvements have been made in the island. At Douglas, a beautiful promenade has been erected; also a handsome landing-pier, at a cost of £48,000. Very extensive breakwater and other harbor works have been erected at Douglas. The total expense has been over £200,000. An outer pier and breakwater, constructed of concrete cement blocks, at a cost of about £150,000, was opened in 1879. At Ramsey, a public promenade and inclosure on the foreshore have been carried out; and harbor works have been erected both here and at Port Erin, in the latter case at a cost of £77,500. Port Erin harbor is more especially designated for the herring fleet, and for the steamers from Ireland, which are expected yet to form a great trade for the island, as a port of call between England and Ireland. A sum of close on £10,000 has been expended in casing the existing breakwater at Peel. To cover the extensive outlay on harbor works the consent of the imperial treasury was asked and obtained in 1866 for the readjustment of duties on articles imported into the island, such as spirits, wines, tobacco, teas, sugar, etc.

The Isle of Man possesses much to interest the antiquary. Castle Rushen (see CASTLETOWN), probably the most perfect building of its date extant, was founded by Guthred, son of king Orry, in 947. The ruins of Rushen abbey, dated from 1154, are picturesquely situated at Ballasalla. There are numerous so-called Druidical remains and Runic monuments throughout the island.

The population of the island, in 1871, was 53,763; in 1861, 52,469; the small rate of increase being attributable to emigration. The language of the natives is a dialect of the Celtic, and is closely allied to the Gaelic and the Erse or Irish. As a spoken language, it is almost entirely disused.

The climate is remarkable for the limited range of temperature, both annual and diurnal; westerly and south-westerly winds greatly predominate; easterly and north-easterly winds occurring chiefly in the autumn quarter. Myrtles, fuchsias, and other tender exotics flourish throughout the year.

The fisheries afford employment to nearly 4,000 men and boys. More than 700 boats of various tonnage are employed in the herring and cod fisheries, the average annual produce being above £60,000. In addition to these, a large number of English and Irish boats arrive at the island during the fishing season. Besides the herrings consumed fresh, there are about 40,000 barrels cured. The trade is chiefly coastwise; the exports are limited to the products of the island.

Agriculture has of late years made considerable progress. Large numbers of fat cattle are shipped to the English markets, as well as about 20,000 quarters of wheat annually. The manufactures are inconsiderable; but to make up for this, about 100,000 visitors come to the island each season.

The revenue derived from the island amounts to about £50,000 per annum; of which the greater part is received from customs duties, and the whole of which, except £10,000 a year payable to the imperial treasury, is used for insular purposes, such as public improvements, education, police, cost of government, etc.

The principal line of communication with the United Kingdom is between Douglas and Liverpool, by means of a fine fleet of swift steamers. There is a submarine telegraphic cable between Maughold head and St. Bees head. In July, 1873, a line of railway was opened between Douglas and Peel; in 1874 to Castletown and the south; and in 1879 to Ramsey—all on the narrow-gauge system.

Previous to the 6th c., the history of the Isle of Man is involved in obscurity; from that period, it was ruled by a line of Welsh kings, until near the end of the 9th c., when the Norwegian, Harald Haarfager, invaded and took possession of the island. According to tradition, in the beginning of the 10th c., Orry, a Dane, effected a landing, and was favorably received by the inhabitants, who adopted him as their king: he is said to

have been the founder of the present Manx constitution. A line of Scandinavian kings succeeded, until Magnus, king of Norway, ceded his right in the island and the Hebrides to Alexander III. of Scotland, 1266 A.D.; this transference of claim being the direct result of the disastrous failure of the expedition of Hacon of Norway against the Scots in 1263. On the death of Alexander, the Manx placed themselves under the protection of Edward I. of England by a formal instrument dated 1290 A.D.; on the strength of this document, the kings of England granted the island to various royal favorites from time to time, until the year 1406, when it was granted to sir John Stanley in perpetuity, to be held of the crown of England, by rendering to the king, his heirs, and successors, a cast of falcons at their coronation. The Stanley family continued to rule the island under the title of kings of Man, until James, the 7th earl of Derby, adopted the humbler title of lord, on his accession to the government. In 1651 the island was surrendered to a parliamentary force by receiver-general Christian, who had raised an armed body against the government, which was then in the hands of the countess of Derby: the parliament having thus obtained possession of the island, granted it to Thomas lord Fairfax. On the restoration, the Derby family were again put in possession. On the death of James, 10th earl of Derby, without issue, in 1735, James, 2d duke of Athol, descended from Amelia Sophia, youngest daughter of James, the 7th earl of Derby, became lord of Man. The Isle of Man having been for a long period the seat of an extensive smuggling-trade, to the detriment of the imperial revenue, the sovereignty of it was purchased by the British government, in 1765, for £70,000 and an annuity of £2,000 a year, the duke still retaining certain manorial rights, church patronage, etc. After negotiation and sales from time to time, the last remaining interest of the Athol family in the island was transferred to the British crown by John, the 4th duke, in Jan., 1829; the amount paid for the island having amounted in the aggregate to £493,000.

The Isle of Man forms a separate bishopric under the title of Sodor and Man. The bishopric of the Sudoreys, or Southern isles, was for a time annexed to Man, hence the title of Sodor, which is still retained, the name having been applied to the islet of Holm Peel, on which the cathedral church of the diocese stands. This bishopric is said to have been founded by St. Patrick in 447. The Manx church has its own canons, and an independent convocation. The see is, for certain purposes, attached to the province of York. There are in the island about 30 places of worship in connection with the established church of Man. The livings are, with few exceptions, in the gift of the crown. The principal denominations of dissenters are represented in the island.

The Isle of Man has a constitution and government of its own, to a certain extent independent of the imperial parliament. It has its own laws, law-officers, and courts of law. The legislative body is styled the court of Tynwald, consisting of the lieut.gov. and council—the latter being composed of the bishop, attorney-general, two deemsters (or judges), clerk of the rolls, water bailiff, archdeacon, and vicar-general—and the house of 24 keys, or representatives. A bill is separately considered by both branches, and on being passed by them, is transmitted for the royal assent; it does not, however, become law until it is promulgated in the English and Manx languages on the Tynwald Hill. The house of keys was formerly self-elective; but in 1866 an act was passed establishing an election by the people every seven years, the electoral qualification being, in the country, £12 yearly value occupation, or £8 proprietary; and £8 proprietary or tenancy in the towns.

The ancient arms of Man were a ship with her sails furled; in 1270 the present arms were substituted, viz., *gules*, three legs of men in armor, conjoined in fesse at the upper part of the thighs, flexed in triangle, garnished and spurred, *or*, with the motto on garter surrounding, *Quocunque jeceris stabit.*

See *The Isle of Man, its History*, etc., by the rev. J. G. Cumming, M.A., F.G.S.; *History of the Isle of Man*, by Joseph Train, F.S.A. Scot.; *Brown's Popular Guide;* and the works published by the Manx society.

MANIS'SA (anc. *Magnesia ad Sipylum*), a t. of Asia Minor, on the s. bank of the Sarabat (*Hermus*), 28 m. n.e. of Smyrna. It abounds in handsome public buildings. Silk and cotton manufactures are carried on. Population variously stated at 35,000 and 60,000. The ancient Lydian Magnesia is famous for the victory of the Romans under Scipio over Antiochus III. of Syria. There was another Magnesia in ancient times, not far from this one, generally called *Magnesia ad Mæandrum.*

MANIS'TEE, a co. of Michigan, having lake Michigan on the w., drained by the Manistee river; 550 sq.m.; pop. '80, 12,533. It is a level region, heavily timbered with pine, and with a fertile soil. The productions are wheat, hay, Indian corn, oats, potatoes, and butter. Co. seat, Manistee.

MANIS'TEE, a city in w. Michigan, incorporated 1869; situated at the mouth of the Manistee river on the shore of lake Michigan; pop. '70, 4,894. It is 45 m. s.w. of Traverse City, 72 m. n. of Muskegon, and 135 m. n.w. of Lansing. It has a prosperous community engaged in farming, and also in the manufacture of lumber, which is exported at the rate of 200,000,000 ft. annually. On the e. is lake Manistee, through which the river finds its outlet, the length of the river from this lake to lake Michigan being 1¼ m., and navigable by vessels of light draught. It has about 20 steam saw-mills

on lake Manistee manufacturing great quantities of shingles, laths, pickets, etc. It has machine-shops, grist-mills, and a tannery. It contains 6 churches, excellent public schools (one building for educational purposes costing $18,000), a court house, and a town-hall. Seat of justice, Manistee.

MANITOBA, RED RIVER, or SELKIRK, SETTLEMENT, was a colony in British North America (of which the chief part is now known as MANITOBA), lying along the Red river of the north. In 1811 the earl of Selkirk, a member of the Hudson's Bay company, attracted by the fertility of the soil on the banks of the Red river, obtained from the company a grant of a large tract of land on both banks of the river, extending some distance within the present frontier of the United States. Next year he brought out a number of settlers from the highlands of Scotland. The right of the Hudson's Bay company to grant this land was, however, disputed by the Northwest company; and when the settlers commenced to build, they were driven off by the servants of the Northwest company. Hostilities continued between the servants of the two companies for several years, and in 1816 there was a pitched battle between them. The earl of Selkirk arriving soon after found his settlers scattered; but by his energetic measures, and by help of 100 disbanded soldiers from Europe whom he had brought with him, he secured for his old and new protegees a peaceful settlement. They established themselves near fort Garry, and in 1817 the earl obtained from the Indians a transfer of their right to the land two miles back from the Red river on both sides. Still the settlers had some difficulties to overcome, especially from visitations of grasshoppers. These were gradually surmounted; but the population, including now a large number of half-breeds, remained very isolated, having little communication with the outside world.

In the year 1869 the Hudson's Bay company surrendered all their claims to the northwest territory to the British government, which in the following year transferred that territory to Canada. The Canadian government now organized that portion of the Red river district between long. 96° and 99° w. and lat. 49° and 50° 30′ n. as the PROVINCE OF MANITOBA. Its area is about 14,000 sq. miles. The Red river valley is a level plain or prairie, with a soil unsurpassed in fertility by any in the world. It consists of from two to four feet of rich black mold, resting on a marly clay which elsewhere would itself be reckoned good soil. In places the ground has been cropped for fifty years without any apparent diminution of its fertility. The surface was generally treeless and ready for the plow, though a few miles to the eastward the country was wooded. The rich natural grasses of Manitoba afford a very favorable pasture for cattle. At the time of the transfer, the population was about 12,000. Since then there has been a steady influx of immigrants from the eastern provinces, from Britain, from the United States, from Iceland, and elsewhere. In 1879 the population of the province was calculated at 75,000. Trade has increased; saw-mills and flour-mills have been established. The seat of government is at fort Garry, now called Winnipeg, a town of near 10,000 inhabitants in 1879. The university of Manitoba, at Winnipeg, embraced the college of St. Boniface (Roman Catholic), St. John (Episcopal), and Manitoba (Presbyterian). Provision has already been made for common schools throughout the province.

The province is represented in the senate of the dominion by two members, and in the house of commons by four. The government of Manitoba consists of a lieutenant-governor, appointed by the dominion government; an executive council of five members; and the legislative assembly of twenty-four members, the province being marked off into that number of divisions. While the proposed transfer to the British crown of the Hudson's Bay company was pending, this portion of their dominions was the scene of considerable contention and violence. The French-speaking population, led by Louis Riel, organized a force, imprisoned their English and Scotch opponents, seized fort Garry, established a provisional government, robbed the strong-box, and dictated terms to the governor of the Hudson's Bay company, to which he had to submit. A military force arrived in the province July, 1870, and Riel, fearing capture, escaped, an event which put an end to the insurrection.

MANITOBA (*ante*). A considerable portion of this province is prairie-land, diversified by patches of elm, ash, oak, poplar, and maple. The soil is a rich black mold, producing from 20 to 25 bushels of wheat to the acre, the grain ripening in 110 days. It produces also oats, barley, corn, hops, flax, hemp, potatoes, and all kinds of garden vegetables. The savannas of the Red river afford excellent pasturage. The winter climate, though severe, is declared to be milder than that of the Red river valley, farther south. The short summers are very warm. The climate, on the whole, is healthful. The Red river is valuable for navigation, except when it overflows its banks and inundates the surrounding country. The Canadian Pacific railway has its course through the province. A large proportion of the inhabitants are Roman Catholics, that religion having been established at an early day by missionaries to the Indians. A Roman Catholic archbishop resides at St. Boniface, and the see-house of the Anglican lord-bishop of Rupert's Land is at fort Garry. The board of education is composed of equal numbers of Roman Catholics and Protestants. There is a considerable Scotch Presbyterian element in the population. St. John's college (Anglican), and St. Boniface college (Roman Catholic), were founded in 1872. The executive government consists of a lieutenant-governor and a council of five. The legislature is composed of a legislative council of

seven members, appointed for life, and of a legislative assembly of 24 elective members. The public business is carried on in both the English and French languages. The common law of England is in force in the province.

MANITOBA, LAKE a body of water in the n.w. territories of Canada, instersected by the 51st parallel and 99th meridian. It is about 60 m. s.w. of lake Winnipeg, which receives its waters through the Saskatchawan or Dauphin river, which, near the middle of its course, expands into St. Martin's lake. Manitoba lake is about 120 m. long, and about 25 m. wide; area, about 1900 sq. miles. It is 40 ft. higher than lake Winnipeg, and navigable for vessels drawing 10 ft. of water, It abounds in fish. At its northern end it receives the waters of several smaller lakes, and at the s. those of the White Mud river. The name, in the Indian dialect, signifies "supernatural strait," the Indians attributing what they regarded as the peculiar agitation of the water in some places to the presence of a spirit.

MAN'ITOU, a name used among most Indian tribes to denote any object of supernatural fear or worship. It somewhat resembles in this the Greek *dæmon*, which meant either a good or evil spirit. The great spirit, or *gitche Manitou*, does not correspond with our idea of a personal God. Any article, as a charm, connected with Indian superstitions is also designated by the same term, just as Africans use the word *fetich* for idols, amulets, or rites.

MAN'ITOU, a co. in Michigan, comprising islands in lake Michigan, 100 sq. m.; pop. '80, 1334. The islands included, and which lie off the coast of the lower peninsula, are the Big Beaver, Great and Little Manitou, Little Beaver, Garden, Hog, South and North Fox. These islands have a rugged surface, and are not very fertile. Co. seat, St. James.

MANITOU'LIN ISLANDS—comprising Grand Manitoulin, or Sacred isle; Little Manitoulin, or Cockburn isle, belonging to Britian; and Drummond isle, belonging to the state of Michigan—are situated in lake Huron, from whose northern shore they are separated by a channel varying from 7 to 18 m. in breadth. Grand Manitoulin is 90 m. long by 5 to 30 broad; Little Manitoulin is circular in shape, and has a diameter of 7 m.; Drummond isle is 24 m. long by from 2 to 12 broad. All are irregular and striking in their natural features, and the Grand and Little Manitoulin are covered with large and dense forests of pine. Pop. '71, 2,011, of whom 1562 were Indians.

MANITOWOC', a co. in e. Wisconsin, on lake Michigan, drained by the Sheboygan, Manitowoc, and East and West Twin rivers; 612 sq.m.; pop. '80, 37,506. The soil is productive, yielding largely of wheat, rye, oats, barley, potatoes, hay, peas, and beans. Other productions are wool, butter, and pine lumber, the latter being the most important article of export. There are a large number of flour, saw, and woolen mills, besides tanneries, breweries, and currying establishments. Co. seat, Manitowoc.

MANITOWOC', chief city in Manitowoc co., in e. Wisconsin, at mouth of the river of the same name and on the Milwaukee, Lake Shore and Western railroad. Its pop. is 5,168, largely German; has a bank, 4 newspapers, tan-yards, factories, and some lake commerce.

MANKA'TO, chief city in Blue Earth co., Minnesota; is 86 m. from St. Paul, on the St. Paul and Sioux City railroad; pop. '70, 3,482. It is also the terminus of the Central road, and is on the Missouri river; has 3 banks, 4 newspapers, a library, state normal school, 8 or 10 manufactories, and a good general trade.

MANLEY, JOHN, 1734–93; b. at Torbay, England; bred a sailor in the maritime service. He soon became a resident of Marblehead, Mass. At the opening of the revolution he was placed by Washington in command of the schooner *Lee*, in which he did good service, seizing several vessels, one of which was of great value. In 1776 he received a regular commission from congress. His first capture in the *Hancock*, his new command, was the man-of-war *Fox*. Owing to cowardly conduct by his consort, capt. McNeil of the *Hector*, capt. Manley was taken by the British man-of-war *Rainbow*, on July 8, 1777. He was tried for his conduct in this affair and honorably acquitted. The last naval combat of the war was between the *Hague*, capt. Manley, and four British men-of-war, the former having been driven on a sand-bank at Guadeloupe. Here for three days Manley defended himself against the tremendous odds and finally effected his escape. After the war his home was at Boston, where he died.

MANLIUS. The Roman family whose members bore this name had many famous representatives, of whom may be noted. 1. MARCUS MANLIUS CAPITOLINUS, who was consul in 392 B.C., and two years later gained his surname by rescuing the capitol from the attacks of the Gauls. From this time forward he courted the favor of the lower classes, and in 381 was arraigned before the centuries and sentenced to be thrown from the Tarpeian rock. The name of Marcus was never after borne by any of the Manlian gens, who considered him a traitor to his family and class. 2. LUCIUS MANLIUS IMPERIOSUS, dictator B.C. 361. 3. TITUS MANLIUS TORQUATUS, son of Lucius, military tribune B.C. 359, twice dictator and three times consul. His surname was derived from his having despoiled a gigantic Gaul of a golden chain (*torques*) after having slain him in single combat. In his last consulship he waged a successful war against the Latins and

caused to be put to death his own son, who had disobeyed his orders by engaging in single combat with the enemy. 4. TITUS MANLIUS TORQUATUS was consul in 235 B.C., and in 224. In that year he defeated the Gauls and crossed the Po, and soon afterwards was victorious over the Carthaginians. He was again elected consul in 210 B.C., but declined the honor. 5. CNEIUS MANLIUS VULSO, consul B.C. 189, after having been prætor in 195 and curule ædile in 197 B.C. He was victorious over the Gauls of Galicia and in Asia, but, on account of a serious defeat when returning through Thrace, with difficulty obtained the honor of a triumph.

MANLY, BASIL, D.D., 1798–1868; b. near Pittsborough, Chatham co., N. C.; graduated at the South Carolina college in 1821; preached in the Edgefield district for three years; pastor of the Baptist church in Charleston 1826–37; president of the university of Alabama 1837–55. Resigning on account of failing health, he took charge of another church in Charleston, which he subsequently left and became a traveling missionary in Alabama. He took an active part in the organization of the southern Baptist convention in 1845, and in the establishment of the theological seminary at Greenville, S. C., in 1858. He published a *Treatise on Moral Science*, which has been a text-book in southern colleges.

MANN, A. DUDLEY, b. Va., 1805; was a commissioner of the United States to negotiate commercial treaties with Hanover, Oldenburg, and Mecklenburg in 1845, and with all the minor German states in 1847; special commissioner to the insurgent government of Hungary in 1849; minister to Switzerland in 1850; private secretary to president Pierce in 1853, but resigned in a few months to devote himself to the development of the material resources of the southern states. In 1861 he was sent on a special mission to induce the European governments to recognize the confederacy, and was afterwards associated for the same purpose with Messrs. Mason and Slidell.

MANN, HORACE, LL.D., American statesman and educationist, was b. at Franklin, Mass., May 4, 1796; graduated at Brown university, Providence, and commenced the study of law. Elected to the legislature of Massachusetts in 1827, his first speech was in favor of religious liberty, and his second a plea for railways. He was an advocate of temperance, and a founder of the state lunatic asylum. Removing to Boston, he was elected, 1836, to the state senate, of which he became president. After editing the revised statutes of the state, he was for 11 years secretary of the board of education. He gave up business and politics and devoted his whole time to the cause of education, introduced normal schools and paid committees, and, in 1843, made a visit to educational establishments in Europe. His report was reprinted both in England and America. For 11 years he worked 15 hours a day, held teachers' conventions, gave lectures, and conducted a large correspondence. In 1848 he was elected to congress as the successor of ex-president John Quincy Adams, whose example he followed in energetic opposition to the extension of slavery. At the end of his term he accepted the presidency of Antioch college at Yellow Springs, Ohio, established for the education of both sexes, where he labored with zeal and success until his death, Aug. 2, 1859. His principal works are his educational reports, and *Slavery, Letters, and Speeches.*

MANNA, a species of sugar which exudes from incisions made in the stems of the manna ash (see ASH), a native of the mountainous parts of southern Europe. Sicily is the chief locality of the manna, and there, in July or August, the collectors make a deep cut through the bark to the wood near the base of the tree with a curved-bladed knife, repeating such incisions daily in different places, always, however, on one side only, and gradually rising until the branches are reached, and then some of the largest are also cut. The following year the other side of the tree is operated upon, and this alternation gives the bark time to heal. If the weather is warm and favorable the manna begins to ooze out of the cuts slowly, and to harden in lumps or flakes, which are from time to time removed by the collectors. Manna is a light porous substance, of a yellowish color, not unlike hardened honey, but harder and drier. There are various qualities known in commerce, according to the time of collection, the goodness of the season, and other causes. It is chiefly used in medicine, having a gentle purgative effect, which renders it valuable for administration to very young children. It consists principally of a crystallizable sugar called *mannite*, and an uncrytallizable sugar, which possesses the sweet and purgative properties. There are several other manna-yielding plants besides the ash, especially the manna-bearing eucalyptus of Australia (*eucalyptus mannifera*), which is non-purgative, and is a favorite sweetmeat with the children of that country.

Small quantities are found on the common larch (*larix Europæus*), in some districts; this kind is known under the name of manna of Briançon. Manna is also obtained in minute quantities from various mushrooms, and from the fronds of some sea-weeds.

The manna of the Israelites, which they ate during their wanderings in the wilderness, appears probably, as shown by Ehrenberg in his *Symbolæ Physicæ* (Fasc. i. 1823), to have been the saccharine substance called *Mount Sinai manna*, which is produced in that region by a shrub, *tamarix mannifera*, a species of tamarisk (q.v.), from the branches of which it falls to the ground. It does not, however, contain any mannite, but consists wholly of mucilaginous sugar. The exudation which concretes into this manna is caused by the punctures made in the bark by insects of the genus *coccus* (*C. manniparus*), which sometimes cover the branches. It is a kind of reddish syrup, and is eaten by the Arabs

and by the monks of Mount Sinai like honey with their bread. It has been very generally supposed that the manna of the Jews was produced by a species of camel's thorn (q.v.).

MANNA CROUP, or MANNA GROATS, a kind of semolina, prepared in Russia, usually from the hard wheats of Odessa and Taganrog. In the process of grinding for flour, small rounded fragments of these hard grains are obtained from the grooves of the grinding-stones, and these constitute the ordinary manna groats, which forms one of the most esteemed materials for puddings. It is undistinguishable from the semolina of Italy. Another kind is made by husking the small grain of the aquatic grass, *glyceria fluitans*, which is carefully collected for the purpose; it is expensive, and is only used as a luxury. Small quantities of the commoner kind are occasionally imported for use in this country, but it is by no means sufficiently well known.

MANNA GRASS, *Glyceria fluitans*, or *Poa fluitans*, a grass plentiful in marshes, ditches, and by the sides of stagnant pools in Britain, and most parts of Europe; found also in Asia, North America, and New Holland. It is also known as *flote fescue*, *floating sweet meadow grass*, etc. It varies in height from one foot to three ft., and has a long, slender, nearly erect panicle, the branches of which are at first erect and appressed to the rachis; the spikelets awnless, slender, cylindrical, an inch long or nearly so, with 7 to 20 florets; the glumes small, unequal, and obtuse; the outer paleæ with seven prominent ribs and a membranous margin; a scale of one thick fleshy piece. The stems are decumbent at the base, and rooting at the joints; the leaves long and rather broad, the lower ones often floating. Manna grass is perennial, and useful in irrigated meadows and in very wet grounds, affording large quantities of food for cattle. In many parts of Germany and Poland, the seeds—which fall very readily out of the spikelets—are collected by spreading a cloth under the panicles and shaking them with a stick; they are used in soups and gruels, are very palatable and nutritious, and are known in shops as *Polish manna*, *manna seeds*, and *manna croup* (q.v.). They are a favorite food of geese, and are also eagerly devoured by carp and other kinds of fish.—Akin to this grass is the reed meadow grass, water meadow grass or reedy sweet water grass (*glyceria* or *poa aquatica*), a still larger grass, with very abundant herbage, the most productive, indeed, of all British fodder grasses, growing in ponds, ditches, marshes, and the sides of rivers, often where they are tidal. Hay made of it is greatly preferred to that of other bog grasses. Its rapid growth often chokes up water-channels, so that they must be cleared of it.

MANNERS, THE FAMILY OF. This noble family are of Northumbrian extraction, their ancestor, sir Robert de Manners, having been lord of the manor of Ethale, or Etal, in that county in the 13th century. His descendant, also sir Robert de Manners, temp. Edward III., was governor of the important border fortress of Norham castle, which he defended with ability against the Scots, and was subsequently commissioned to treat, on part of the king, with David Bruce, concerning the ratification of peace. In the reign of Henry VI., we find another sir Robert de Manners acting as sheriff of Northumberland, and representing that county in parliament; a post at that time, as sir B. Burke remarks, of great power and profit. His wife, a daughter of the noble house of Roos, or De Roos, brought to him that ancient barony, and with it the castle of Belvoir, Leicestershire; the grandson of this marriage was raised to the earldom of Rutland by Henry VIII.; and the tenth earl was raised to the dukedom in 1603. The eldest son of the third duke was the celebrated marquis of Granby (q.v.), who attained a very high reputation as a field-officer whilst acting as commander-in-chief of the British forces serving under prince Ferdinand in Germany, but who did not live to inherit the dukedom. The marquis's youngest brother having married the heiress of Sutton, lord Lexington, assumed the additional name of Sutton, and became the father, *inter alios*, of two sons, one of whom was for many years archbishop of Canterbury, and the other held the high post of lord chancellor of Ireland early in the present century, whilst the archbishop's son presided as speaker over the councils of the house of commons. The present heir-presumptive to the dukedom of Rutland is *lord John James Robert Manners*, son of the late and brother of the present duke.

MANNERS, JOHN. See GRANBY, *ante*.

MANN'HEIM, formerly the capital of the Rhenish palatinate, now the most important trading town in Baden, and, after Cologne and Coblentz, the most important on the Rhine, is situated in a fertile plain, on the right bank of the Rhine, at the junction of the Neckar, about 18 m. below the city of Spires. The site of the town is low, and a high dike protects it from inundations. A bridge of boats crosses the Rhine, which is here 1200 ft. in breadth, and a chain bridge the Neckar. The town is remarkable for its cleanliness and regularity, the whole of it being laid out in quadrangular blocks. Its fortifications were destroyed after the peace of Lunéville, and gardens now occupy their place. The palace, built 1720–29 by the elector palatine Karl Philipp, is one of the largest buildings of the kind in Germany. The city contains a lyceum with a library, a botanic garden, an observatory, etc. Tobacco, shawls, linen, and playing-cards are manufactured, and there are several tanneries and bleach-works. A thriving trade is carried on chiefly by boats on the Neckar and Rhine. About 6,600 vessels, of

270,000 tons, enter and clear the port annually. Mannheim is connected by railway with the chief towns of Germany. Pop. '71, 39,614.

Mannheim was a mere village till the beginning of the 17th c., when a castle was built by the elector palatine Frederick IV., around which a town grew up, chiefly peopled by exiles for religion from the Netherlands. It was several times taken and retaken during the wars of the 17th c., totally destroyed by the French in the end of that century, rebuilt, and strongly fortified.

MANNING, HENRY EDWARD, Cardinal, b. July 15, 1808, at Totteridge in Hertfordshire, England; was educated at Harrow school and Balliol college, Oxford, where he took orders in the church of England. In 1834 he was presented to the living of Lavington and Graffham in Sussex co., and in 1840 was appointed archdeacon at Chichester, the cathedral town. Up to this time he was a consistent high-church Anglican, though, like many Oxford divines, inclined to Puseyism; but in 1851 the decision of the courts in the noted Graham case, which seemed to Manning and others to claim for the crown authority over a purely doctrinal question on the subject of baptism, left him, he thought, no alternative but to abandon his preferment and become a member of the Roman Catholic church. It was thought by many that this would prove the beginning of a serious movement toward Rome on the part of a large section of the Anglican church. For three years he studied the dogmas and rites of his new faith at Rome, and in 1857 was ordained by cardinal Wiseman and became priest of the parish of St. Helen and St. Marys. In 1865 he was nominated archbishop of Westminster, and other ecclesiastical honors were conferred upon him. He has always been particularly energetic in the matter of public education; in 1874 was opened the Kensington university (Roman Catholic), in the founding of which he had been for several years concerned. Perhaps more than any other dignitary of his church, he has been active in providing primary education for the masses. The cardinal's hat was conferred upon archbishop Manning by Pius IX in Mar., 1875. In the Vatican council of 1869–70 he took a prominent part, sustaining the extreme advocates of infallibility; and his controversy on the subject with bishop Dupanloup was one of the prominent features of that time. *Petri Privilegium* (1871) is an exposition of the doctrine and an account of the proceedings. On the same subject he has also published answers (1875) to Mr. Gladstone's expostulation, giving his views of the bearing of the Vatican decrees on civil allegiance. Besides these works he has published sermons and numerous pamphlets on ecclesiastical subjects and on the condition of Ireland, in the government of which he has long advocated reform. Among these are: *Unity of the Church* (1842), *Temporal Mission of the Holy Ghost* (1865), *Temporal Power of the Pope* (1866), *England and Christendom* (1867). The cardinal is a man of great keenness of intellect, firmness of purpose, and fervor of spirit.

MANNING, JACOB MERRILL, D.D., b. Greenwood, N. Y., 1824; graduated at Amherst college in 1850, and at Andover theological seminary in 1853. In 1854 he was settled as pastor of a Congregational church in Medford, Mass., but resigned in 1857 to become associate pastor of the Old South church in Boston, where he still (1881) remains, being now the sole pastor. He has been a contributor to the *Bibliotheca Sacra;* was the orator of Boston, July 4, 1865; and has published *Truths and the Truth* and *Helps to a Life of Prayer*. His discourses and writings show a strong and clear intellect, with a finished literary taste.

MANNING, JAMES, D.D. 1738–91; b. Elizabethtown, N. J.; graduated at Princeton college in 1762; became pastor of a Baptist church in Morristown, N. J., in 1763, and soon afterwards in Warren, R. I. In 1763 he proposed to some prominent Baptist gentlemen of Newport the formation of a "seminary of polite literature, subject to the government of the Baptists," and prepared a plan for the institution. The neccessary money was raised, and a charter obtained in 1764. In 1765 Mr. Manning, but 27 years of age, was appointed "president and professor of languages and other branches of learning, with full power to act in these capacities, at Warren or elsewhere." The college, first called Rhode Island college, was opened at Warren in 1766, and in 1770 removed to Providence. In connection with the presidency, he was pastor of the First Baptist church. During the revolution, when the college was occupied as a military barrack and afterwards as a hospital, Manning continued his duties as pastor and used his influence in behalf of his country. In 1783 he resumed his duties as president, and in 1786 was elected to congress, still retaining his connection with the college. While in congress he took an active part in the adoption of the national constitution. He resigned the presidency in 1790. Dr. Manning may be regarded as the founder of the college, though the plan was suggested by an association of ministers in Philadelphia. He was distinguished as a pulpit orator, possessing, according to his biographer, "a most attractive and impressive exterior, a voice of extraordinary compass and harmony, and manners expressing remarkable dignity and grace." The name of the college was changed to Brown university, in 1804 in honor of Nicholas Brown its liberal benefactor.

MANNING THE NAVY. Until a recent date sailors only engaged themselves for the term a certain vessel should be in commission, which there was a tacit understanding would be about five years. When the captain hoisted his pendant, the men came down and volunteered, or the crimps in some manner made it their interest to produce them. When the captain was a popular officer or noted for his daring, his crew was soon com-

pleted; while, when his reputation was that of a martinet, or of a commander under whom prize-money would probably be scarce, a ship would often lie for weeks, or even months in harbor, while the authorities sought in vain to provide her complement of men. In the Napoleonic and former wars, when seamen were urgently needed and knew their value, the press-gang was resorted to, and vacancies filled by compulsion. See IMPRESSMENT.

At present seamen are encouraged by contingent advantages to enlist for a specified number of years, at the end of which they become entitled to permanent pension. On the paying off of their ship, these men are granted liberal leave, after which they join a depot, and are thence drafted to some other vessel in which their services are required. As a reserve for times of emergency, there are the royal naval coast volunteers (see COAST VOLUNTEERS), and the royal naval reserve (q.v.), both very important auxiliaries, of which the value became instantly apparent when hostilities with the United States were anticipated in 1861.

The Dutch, Danish, and Swedish navies are mainly manned by volunteers, as is that of the United States. The navies of France, Russia, and Italy are manned by conscripts levied in the maritime provinces of the respective countries. The German ships of war depend on the law of compulsory service for their complement.

MANNING THE YARDS, in a practical sense, consists in sending sufficient men aloft and on to the yards to furl or unfurl the sails: in a complimentary sense, the yards are said to be manned when a row of sailors, with their hands touching, are ranged along them, standing on the yard itself, and holding to a rope which runs across about breast-high between the lifts. When the men are all in clean white uniforms the act of manning the yards has a singularly lively and picturesque effect. It is resorted to when any great personage passes by the ship or comes on board, or in commemoration of some great event; but as the operation is attended with considerable and unnecessary danger, it is, under present regulations, performed far more rarely than used to be the case.

MANNITE. See MANNA.

MANNITE, or MUSHROOM SUGAR ($C_{12}H_{14}O_{12}$), is a peculiar saccharine matter which forms the principal constituent of manna (q.v.); it is also found in several kinds of fungi, in asparagus, celery, onions etc. It is most readily obtained by digesting manna in hot alcohol. On cooling the filtered solution, the mannite is deposited in crystals, which are very soluble in water, and possess a sweet taste. It is not susceptible of alcoholic fermentation, and may be readily distinguished from cane and grape sugar by simple tests. Heated with hydrate of potash, it gives a mixture of acetate, formate, and valerianate of potash, hydrogen being evolved.

MANNUS, according to Tacitus, the name given by the Germans to the son of the earth-born god *Tuisco*. From his three sons they derived their three great tribes, the *Ingavones*, the *Iskavones*, and the *Herminones*. Mannus belongs, not to the Teutonic people alone, but to the great mythus of the origin of the human race, common to the whole Aryan family, and, like the Hindu *Manu* or *Manus*, stands forth as the progenitor of the inhabitants of earth endowed with reason. The name is derived from the Aryan root *man*, to think. Compare Wackernagel in Haupt's *Zeitschrift für Deutsches Alterthum* (Bd. 6).

MANOËL, Don FRANCESCO, the most eminent of modern Portuguese lyric poets, was born at Lisbon in 1734, and devoting himself to the pursuits of literature, acquired a high reputation. The hostility of the inquisition compelled him, however, to abandon his native country. He took up his residence at Paris, where he died, 25th Feb., 1819. There are more editions than one of his *Obras Completas*. His odes are highly esteemed.

MAN OF SIN, an expression used by the apostle Paul in 2. Thess. ii. 3, and which is variously interpreted. The Roman Catholics assert that the *Man of Sin* is Antichrist. The Puritans applied the term to the pope of Rome; the fifth-monarchy men to Cromwell, and some modern theologians consider it as indentical with that "wicked one" referred to in v. 8 by the apostle, who is to appear immediately before the second advent of Christ, whom he will destroy with the "spirit of his mouth" and the "brightness of his coming."

MAN-OF-WAR, an expression, of unknown origin, for an armed vessel carrying cannon, and belonging to some constituted and acknowledged government. As such she possesses the privileges of war: her deck is, by a legal fiction, taken to be a portion of the soil of the nation whose flag she hoists; in time of war she is justified in attacking, sinking, burning, or destroying the ships and goods of the foe, and by the law of nations, she may stop and search the merchant-vessels of neutral powers which she suspects of carrying aid to her enemy. See CONTRABAND. In case of being overpowered, the crew of a man-of-war are entitled to the ordinary mercy granted to vanquished combatants, lawfully fighting. Any vessel making war, but not belonging to an acknowledged government, is either a privateer (see LETTER OF MARQUE) or a pirate (see PIRACY).

MAN-OF-WAR BIRD. See FRIGATE BIRD.

MANOM'ETER (Gr. *manos*, thin, rare) is properly an instrument for measuring the rarity of the air or of other gases; but the name is most frequently applied to instruments for indicating the elastic force of gases, which is always inversely proportional to their rarity. The several kinds of barometers (q.v.) are really manometers, and so is the steam-gauge of a steam-engine (q.v.).

MANOM'ETER (*ante*). The various forms of manometer may be classified under three heads: 1, the open-air manometer, on the principle of the barometer; 2, the confined-air manometer, on the principle of Mariotte's instrument (q.v.); and 3, the metallic-spring manometer. A simple open-air manometer consists of a glass tube, open at both ends, placed upright in a strong bottle of glass or iron, the bottom of which contains mercury. The tube passes through a tight packing box in the neck. In the upper part of the bottle there is an orifice which admits compressed air, acted upon by steam or vapor, whose tension it is desired to measure. But this form cannot be used for high pressures. The multiple-branch manometer is a modification of the simple open instrument, and is constructed by bending a long tube, open at both ends, in a series of V-shaped flexures of from 20 to 40 in. in height, the number of flexures depending upon the pressure the instrument is liable to be subjected to. Columns of mercury, of equal height, being placed in the lower halves of the V-shaped legs, will indicate the pressure excited at one end of the tube, by the sum of the excess of height of the mercurial columns in alternate legs, or by multiplying the excess of height in one leg by the number of legs containing such excess. The system is fastened to a board or metallic plate, which at one side, near the last branch, is furnished with a graduated scale. The compressed-air manometer is simply a strong V-shaped tube closed at one end, while at the other is attached the pipe communicating with the gas or vapor whose tension it is desired to measure. A portion of the flexure of the V contains mercury, and the space between it and the closed end is filled with common air. Now, according to Boyle's or Mariotte's law, a pressure exerted on the column of mercury sufficient to force the air into half the space it occupies at the normal atmospheric pressure, must become doubled, or 15 lbs. to the square inch must be added. Again, to compress the air into half the remaining space, 30 lbs., or double the pressure required for the reduction to the first half, must be added, making in all a pressure of four atmospheres for the reduction to one-fourth the original volume. It is evident, therefore, that a graduated scale, to exhibit the degrees of pressure, must have its spaces decrease from below upwards. The graduation is accomplished by means of an open-air multiple manometer. The metallic-spring manometer consists of an index traversing a graduated arc, and having applied to a spring connected with it—which may be in the form of a spiral—a piston actuated by the force of the gas or vapor in the boiler or steam-chamber.

MANOR, in English law, is a freehold estate held by the lord of the manor, who is entitled by immemorial custom to maintain a tenure between himself and the copyhold tenants, whereby a kind of feudal relation is kept up between them. As, however, subinfeudation in England was prohibited by the statute of *quia emptores*, in the reign of Edward I., and no manor could be created since that date, it follows that all existing manors must trace their origin from before that time. Copyhold estates are thus a relic of ancient feudalism, and form an exception to the general rule in England, where freeholds form the highest kind of estate known to the law. See COPYHOLD. Manors closely resemble the feudal estate held in Scotland by all proprietors of land, who have to this day unlimited powers of subinfeudation, which they constantly act upon, and thus keep up a chain of vassals. See FEU.

MANRENT (more properly, MANRED), BONDS OF, agreements which used to be entered into in the Highlands of Scotland between the greater and lesser magnates, where protection on the one hand was stipulated in return for allegiance on the other. Such bonds were common up to two or three centuries ago, the royal authority being comparatively powerless to repress internal warfare among the fastnesses of the n. and west.

MANRE'SA, a t. of Spain, in the province, and 30 m. n.w. of the city, of Barcelona. It is situated in a fertile and well-irrigated district, on the left bank of the Cardonet. Manresa has manufactures of cotton and silk fabrics, broadcloths, etc. In 1811 it was set on fire by marshal Macdonald, when more than 800 houses, with churches and manufactories, were burned down. Pop. 15,264.

MANS, LE, a city of France, formerly capital of the province of Maine, now of the department of Sarthe, on the right bank of the river of that name, 132 m. s.w. of Paris by railway. The chief edifice is the cathedral, containing the tomb of Berengaria of Sicily, the queen of Richard Cœur de Lion. There is a public library of 50,000 vols., and several artistic and scientific institutions. The town manufactures wax-candles, woolens, lace, soap, and hosiery, and is famous for its poultry, of which it sends a large supply to the metropolis. It gives its name to a battle in the Franco-Prussian war of 1870–71, in which the French were defeated with the loss of 20,000 prisoners. Pop. '76, 45,709. Le Mans (anc. *Cenomani*) was, in the age of Charlemagne, one of the chief cities of the Frankish empire.

MANSARD ROOF, a form of roof invented by Francis Mansart, a distinguished French architect of the 17th century. It is constructed with a break in the slope of the roof so

that each side has two planes, the lower being steeper than the upper. The framework ought to be arranged so that its parts are in equilibrium. This kind of roof has the advantage over the common form of giving more space in the roof for living room.

MANSAROWAR, or MANSAHROR, LAKE, is situated on the n. side of the Himalaya mountains, which divide Hindustan from Thibet and Tartary, and is the source of the river Sutlej. It is 11 m. in breadth from n. to s., and 15 m. in length, and is supposed to have been formed in the crater of a volcano. It derives importance from the fact of its being an object of veneration on the part of both the Hindus and the Tartars. The former esteem it as the most sacred of all their various places of pilgrimage, and incur all kinds of hardships in the course of their endeavor to visit it from long distances. The Tartars regard it no less highly, and convey a portion of the ashes of their friends to its shores to be thrown into it. It is situated on an elevated plain covered with long grass, to the n. of which is a conical hill dedicated to Mahadeva.

MANSART', or MANSARD, FRANÇOIS, 1598–1662; b. France, of Italian origin. A thorough education, lively imagination, and horror of tinselry in architecture, led him, says his French biographer, from the over-decorated style of his time, to adopt a severity and heaviness of style that was even less pleasing. He was the artist of many creditable though not remarkable works, and is credited with the first adoption of the double-slope roof, in general use a hundred years ago, under the name of gambrel roof, and again came into fashion under the name of Mansard roofs since 1850; but with such bold and decorative modifications from the original form as hardly to be assigned to the original source.

MANSART', or MANSARD, JULES HARDOUIN, 1645–1708; b. in Paris, son of an obscure painter, who had married a sister of François Mansart. The uncle perceiving the talent of the nephew and his great industry, did all in his power to advance him, and with such success that the nephew, having assumed his uncle's name, soon became the most famous of the two; and being also a skillful courtier secured Louis XIV. for patron, and entered upon the construction of some of his most splendid works. The château de Clagny was his first work. The next was a château for Mme. de Montespan at Versailles. The extravagance and rage for palace building which possessed the king was turned to the greatest advantage by Mansart, both as an artist and a man of business. He accumulated an immense fortune, and was covered with dignities and honors. His pride, vanity, and envy soon made him the object of opposition and detraction, but he made good his place in the favor of the king. His enemies accused him of using the influence of the king's mistresses, and of making plain faults in his plans so that, the king seeing them instantly, he could turn the fact to compliment him on the remarkable quickness of his eye and justice of his taste with an air that made the king the dupe of his cunning. He was the architect of many noted châteaux before engaging in 1660 upon the palace of Versailles, which, monstrous as was its expense, has never been considered proportionately beautiful. The grand Trianon was his work; but his most perfect design is the dome of the church of the Invalides in Paris, which, though inferior to very many domes in size, surpasses all in the exquisite proportions of its exterior lines. The *place Vendôme* and the *place des Victoires* in Paris are also by Mansart.

MANSE, in Scotch law, is the designation of a dwelling-house of the minister of the established church, and in popular use the term is often applied generally to the dwelling-house of any minister of a dissenting congregation, though no legal right exists in the latter case. In the established church every minister of a rural parish is entitled to a manse, which the heritors or landed proprietors are bound to build and uphold; and he is also entitled, as part of the manse, to a stable, cow-house, and garden. The manse must, by statute, be near to the church. The usual sum allowed of late years to build a manse is £1000. It has often been made a question, how far the heritors can be compelled to rebuild a manse which, by time or other circumstances, has become inadequate. It is now held to be the law, that at least the presbytery has power to order sufficient alterations and additions, and they can order a visitation, and take estimates from skillful tradesmen, and decree what is necessary to be done. It is only the ministers of rural parishes that are entitled to a manse, and not ministers of a royal burgh where there is no landward district.

MANSEL, The Rev. HENRY LONGUEVILLE, B.D., Waynflete professor of moral and metaphysical philosophy in Oxford; was b. at Cosgrove, Northamptonshire, in 1820, his father being rector of the parish. He was educated at Merchant Taylors' school, and at St. John's college, Oxford; and graduated in 1843. In 1855 he was appointed reader in moral and metaphysical philosophy in Magdalen college; and in 1859 became Waynflete professor. In 1867 he received the appointments of regius professor of ecclesiastical history, and canon of Christ church, Oxford. His published works are: Aldrich's *Logic*, with notes (1849); *Prolegomena Logica* (1851); article *Metaphysics* in 8th edition of the *Encyclopædia Britannica* (1857), afterwards published separately; *Bampton Lectures—The Limits of Religious Thought* (1858); *The Philosophy of the Conditioned* (1866), in reply to Mill's *Review of Hamilton's Philosophy*. He was co-editor, with prof. Veitch, of sir William Hamilton's lectures.—Mr. Mansel is considered as belonging to the school of sir W. Hamilton. He was well versed in the erudition of metaphysical philoso-

phy, and wrote in a clear and elegant style. His *Bampton Lectures* occasioned much controversy, both theological and philosophical. See CONDITIONED. He died July 30, 1871.

MANSFELD, ERNST, 1585–1626; the illegitimate son of count Peter Ernst; educated by his god-father, archduke Ernst of Austria. In return for valuable military services under Rudolph II. the stigma of his birth was removed by decree of the emperor. The title and estates of his father were, however, refused, and in revenge he joined the enemies of Austria in the thirty years' war, and became a stanch Protestant champion. Under the elector Frederick he fought desperately in Bohemia and on the Rhine. His efforts failed, but they brought him great renown; and in 1625, aided by English subsidies, he again attacked Austria. Wallenstein met and overcame his force at Dessau, April, 1626. It was on the retreat which ensued after this defeat that he died.

MANSFELD, PETER ERNST, Count, 1517–1604; b. at the castle of Mansfeld in Prussian Saxony; for many years an officer of Charles V. and Philip II. of Spain. From 1552 to 1557 he was a French prisoner. After his release he was made governor of Luxemburg, and afterwards governor-general of the Netherlands. In 1594 he was given the title of prince and returned to Luxemburg, where he resided until his death.

MANSFIELD, a market t. of England, in the co. of Nottingham, and 14 m. n. of the town of that name, is surrounded by the remains of the ancient forest of Sherwood. It stands in the center of a large manufacturing and mining district, and contains, among other institutions, a royal free grammar school, with an annual income from endowment of £250. Silk, cotton, and doubling mills are in operation, and the corn and cattle markets are largely attended. Pop. '71, 11,824.

MANSFIELD, a t. in the s.w. part of Tolland co., Conn., on Willimantic river and New London Northern railroad. The main industry is the manufacture of sewing silk; pop. 2,401. It is the site of a soldiers' home.

MANSFIELD, a city in Richland co., Ohio; pop. 8,025. It is the junction of four railroads, of which the Atlantic and Great Western and the Pittsburg, Fort Wayne and Chicago are the most important. It has 7 hotels, 4 banks, 4 newspapers, an opera-house, public library, water-works, and many churches and schools. The manufacture of agricultural tools is a specialty, and the trade of the place is very heavy with the surrounding country, which is a productive farming region.

MANSFIELD, EDWARD D., LL.D., 1801–80; b. New Haven, Conn.; graduated at West Point in 1819, but declined to enter the army; and graduated at Princeton in 1822; studied law at the (then) Litchfield (Conn.) law school. After being admitted to the bar he removed to Cincinnati, and in 1836 became professor of constitutional law in the college there. Shortly afterwards, however, he abandoned the legal profession to engage in journalism, editing successively the Cincinnati *Chronicle*, *Atlas*, *Gazette*, and *Railroad Record*. He was commissioner of statistics for the state of Ohio from 1857 to 1867, and a member of the *société Française statistique universelle*. He was for several years a writer for the *New York Times* under the signature of "Veteran Observer." He published *Utility of Mathematics; Political Grammar; Treatise on Constitutional Law; Legal Rights of Women; Life of Gen. Scott; History of the Mexican War; American Education;* etc. Died in Cincinnati.

MANSFIELD, JARED, 1759–1830; b. New Haven; graduated at Yale college in 1777; became distinguished as a teacher and for his scientific acquisitions; was appointed in 1802 to a captaincy in the engineer corps of the army and assigned to duty at West Point as acting professor of mathematics. In 1803 he was appointed surveyor-general of the north-west territory and removed to Ohio, where he was employed in making the meridian lines on which is based the system of the public land survey. To accomplish this work he imported astronomical instruments from London, and established in his own house near Cincinnati the first observatory in the United States. In 1812 he returned to New Haven, and before the end of that year was appointed professor of natural and experimental philosophy at West Point. In 1828, after serving a term of 16 years, he resigned and returned to New Haven, where he died.

MANSFIELD, JOSEPH K. F., 1803–62; b. New Haven, Conn.; graduated at West Point in 1822, and entered the army as second lieut. of engineers. He was engaged in engineering duties on the Atlantic and Gulf coasts until 1846; in the war with Mexico he was chief engineer of gen. Zachary Taylor's army, distinguishing himself in the defense of fort Brown and in the battles of Monterey and Buena Vista, and being raised to the rank of col. by brevet. After the war he was for five years a member of the board of engineers for fortifications on the Atlantic and Pacific coasts; in 1853 he was appointed inspector-gen. of the army with the rank of col., which post he held until the breaking out of the rebellion, when he was placed in command of the department of Washington, and at once commenced the work of fortifying the capital. In Oct., 1861, he was transferred to camp Hamilton, Va., and in the month following to Newport News. He took part in the capture of Norfolk May 10, 1862, and commanded at Suffolk from June to September of that year, when he was assigned to the command of a division in the army of the Potomac, at the head of which, in the battle of Antietam,

he was mortally wounded, dying Sept. 18, 1862. Before assuming his last command he was promoted to be maj.gen. of volunteers.

MANSFIELD, MOUNT, in Cambridge, Vt., the highest elevation of the Green mountain range, being 4,348 ft. above the sea. It presents a grand appearance from all sides, and the view from the summit is one of the finest in New England. It commands a prospect of the Adirondacks on the w., the Green mountains on the s., parts of the White mountain range on the e., and the mountains surrounding Montreal on the north. In some states of the atmosphere lake Champlain also is visible. A wagon road leads to the summit on the eastern side, and there are accommodations for visitors at the top.

MANSFIELD, WILLIAM MURRAY, Earl of, lord-chief-justice of the king's bench, was the fourth son of Andrew, viscount Stormont, and was born at Perth, Mar. 2, 1704. He studied at Christ-church, Oxford, took the degree of M.A. in 1730, and was called to the bar in 1731. He soon acquired an extensive practice—mainly, it would seem, on account of his facility and force as a speaker, for neither then nor at any subsequent period of his career was he reckoned a very erudite lawyer—and was often employed on appeal cases before the house of lords. In 1743 he was appointed by the ministry solicitor-general, entered the house of commons as member for Boroughbridge, and at once took a high position. In 1746 he acted, *ex officio*, as counsel against the rebel lords, Lovat, Balmerino, and Kilmarnock; was appointed king's attorney in 1754; and at this time stood so high that, had not the keenness of his ambition been mitigated by a well-founded distrust of his fitness for leading the house, he might have aspired to the highest political honors. He became chief-justice of the king's bench in 1756, and entered the House of Lords under the title of baron Mansfield of Mansfield in the county of Nottingham. Still, his political *rôle* has little interest for posterity. As his opinions were not those of the popular side, he was exposed to much abuse and party hatred. Junius, among others, bitterly attacked him; and during the Gordon riots of 1780, his house, with all his valuable books and manuscripts, was burned. He declined, with much dignity, indemnification by parliament. In 1776 Murray was made earl of Mansfield. He worked hard as a judge till 1788, when age and ill-health forced him to resign. He died Mar. 20, 1793, in the 89th year of his age.

MANSFIELD VALLEY, a village of Alleghany co., Penn., 5 m. from Pittsburg, on Chartiers creek, and the Panhandle and Chartiers Valley railroad; pop. about 3,000. It has 5 churches, an academy, a newspaper, 3 savings banks, a smelting furnace, a glass factory, and an abundant supply of coal.

MANSLAUGHTER is, in Scotland, the offense of causing the death of a person by some carelessness or neglect. In England the offense is usually called culpable homicide.

MANSLAUGHTER (*ante*), the unlawful killing of another without malice, express or implied. Manslaughter is either voluntary, i.e., where there was an intent to commit the injury; or involuntary, where there was no such intent. It differs from murder in its absence of malice, and, as it is supposed to be committed in hot blood, no person can be an accessory before the fact. Among cases of homicide which constitute a manslaughter may be mentioned killing a person by gross negligence, though in the discharge of a lawful act; killing a person who has given great provocation; and killing an officer acting without or beyond his authority, though this may also be excusable homicide. The killing of an officer acting within his legal authority is murder. The provocation above-mentioned must be immediate, not remote; and though proof of provocation sufficiently repels the presumption of malice which the law attaches to every case of homicide, it is not sufficient to lower an offense from murder to manslaughter, if express malice be made out. In most of the United States manslaughter is divided into different degrees, punished with longer or shorter terms of imprisonment.

MANSTEIN, VON, a Prussian gen. who distinguished himself in the Franco-Prussian war of 1870. At the head of the 9th corps, in the army of prince Frederick Charles, he participated in the battle of Vionville. At Gravelotte, Aug. 18, 1870, he commanded the German center, and served throughout the campaign, retiring in 1873.

MANT, RICHARD, D.D., b. Southampton, Eng., 1776; educated at Winchester college, and Trinity college, Oxford, taking his bachelor's degree in 1797; was elected fellow of Oriel college in 1798; was curate and vicar of several parishes in and near London 1804–15; received degree of D.D. from the university of Oxford; was made bishop of Killaloe and Kilfenora, Ireland, in 1820, and in 1823 transferred to the see of Down and Connor. He was the author of a valuable *Commentary on the Bible* in connection with Dr. D'Oyley. This had an immense sale in England, and was republished in New York, with additions by bishop Hobart. Besides many sermons and tracts, and several poetical pieces, he published *Biographical Notices of the Apostles; Scriptural Narratives of Christ's Life; History of the Church of Ireland from the Reformation to the Union of the Churches of England and Ireland in* 1801; *Ancient Hymns from the Roman Breviary with original Hymns.*

MANTCHU'RIA, a territory in eastern Asia, under the dominion of the Chinese empire, extending between lat. 42° and 53° n., and bounded, according to its present limits, by the Amur on the n.; by the Usuri and the Sungacha on the e., separating it

from the Russian maritime territory of Orochi; by the Shan-Alin range on the s., separating it from Korea; and by a portion of the Khingan mountains, the river Sira-Muren, and the district of the upper Sungari, which separate it on the w. from the desert of Gobi. Previously to the incursions of the Russians on the n. the area of this territory was about 682,000 sq.m.; it is now about 378,000 sq.m.; nearly one-half having passed into the possession of the Russians, who concluded a treaty with the Chinese, Nov. 14, 1860, finally making over to themselves all the territory e. of the Usuri and n. and e. of the Amur. Pop. variously estimated at from 3,000,000 to 4,000,000. Mantchuria is divided into three provinces, Shing-King—formerly Leaotong, which alone contains upwards of 2,100,000 inhabitants, and the chief town of which, Mukden, is the seat of government for the three provinces—Girin or Kirin, and Tsi-tsi-har. The country is mountainous, densely wooded in the s,, but consisting chiefly of prairies and grass-land in the north. It is well watered and fruitful in the valleys. The rivers are the Amur (the northern boundary), the Usuri (the eastern boundary), and the Sungari, which waters the two provinces of Girin and Tsi-tsi-har. The Sungari is about 1200 m. in length; its banks, which form the most densely-peopled region of Mantchuria, are low and fertile, and its general course is n.e. to its junction with the Amur. About 200 m. from its source, it passes the flourishing trading city of Girin, in lat. 43° 40′ n., with a pop. variously estimated at from 150,000 to 160,000, and inhabited by Mantchus and Chinese, but by the latter in far greater numbers. The city of Mukden, on the Sira-Muren, is large and beautiful, surrounded by walls, and containing 200,000 inhabitants. In 1631 it was the seat of the government of the empire of Mantchu. Millet, barley, tobacco, and oats are largely produced, and herds of cattle are fed on the prairies. Chinese form the great bulk of the population; the Mantchus are for the most part soldiers, and are drafted out of the country into China. For the history of Mantchuria, see CHINESE EMPIRE.

The Mantchus are the present rulers of China, who gradually subjugated the country; the first emperor of the new dynasty, Shunche, succeeding to the last of the Mings in 1644. They are not a nomadic race like the Mongols, but are given to agriculture or hunting, according to the part of their country they inhabit. They are of a lighter complexion and slightly heavier build than the Chinese, have the same conformation of the eyelids, but rather more beard, and their countenances present greater intellectual capacity. Literary pursuits are more esteemed by them than by Mongolians, and they are less under the priesthood. The Mantchus, in short, may be regarded as the most improvable race in Central Asia, if not on the continent.—Williams, *Middle Kingdom*.

MANTEGN'A, ANDREA, 1431-1517; studied art under Francesco Squarcione, a famous master of Padua. Here Mantegna produced his first work in the churches of *Santa Sofia* and *San Christofano*. Rapidly acquiring skill and fame, he removed to Mantua, where his acknowledged masterpiece, "The Triumph of Cæsar," was painted. This is now at Hampton court, England. From Mantua he was called to Rome by Innocent VIII., and received from him the kindest treatment and remunerative employment, but soon returned to Mantua. Here, by his proficiency and genius both in the higher class of engraving and as a religious and historical painter, he obtained a high rank in his profession as well as large estate.

MANTELL, GIDEON ALGERNON, an eminent British palæontologist and geologist, was b. at Lewes, in Sussex, in 1790; studied medicine, and for some time practiced in his native town. Subsequently he removed to Brighton, and thence to London, where he died, Nov. 10, 1852. Mantell's principal works are: *Fossils of the South Downs* (1822); *The Fossils of Tilgate Forest; Wonders of Geology* (1838), perhaps the most popular geological work ever written by an Englishman; and *Medals of Creation, or First Lessons in Geology* (1844). He was a very voluminous writer, no less than 67 works and memoirs of his being mentioned in Agassiz and Strickland's *Bibliotheca Zoologiæ et Geologiæ*. His claims to a permanent place in the history of science rest chiefly on his laborious investigations into the fossils of the Wealden beds. To him we owe the discovery and description of four out of five of the great dinosaurian reptiles—viz., the *iguanodon*, the *hylæosaurus*, the *pelorosaurus*, and the *regnosaurus*.

MANTEL-PIECE, the lintel over the opening of a fire-place supporting the masonry above. It was in ancient times frequently ornamented with moldings and carving. The name is now applied to the marble or wooden jambs, lintel, and shelf so universally used.

MANTES (anc. *Medunta*), a t. of France, in the department of Seine-et-Oise, beautifully situated on the left bank of the Seine, 29 m. w.n.w. from Paris, on the railway between Paris and Rouen. Mantes is a place of great antiquity, and of much historic interest. It was a town of the Celts, from which the Druids were expelled by Julius Cæsar. William the conqueror took it by assault in 1087, put the inhabitants to the sword, razed the fortifications, and burned three-foruths of the houses; but here he received the injury, through the starting of his horse, which caused his death in a few days. Mantes has has a considerable trade in wheat, large tanneries, and saltpeter manufactories. Pop. '76, 5,649. On the opposite side of the river, connected with Mantes by bridges and an island, is the village of Limay, with a pop. of 1304.

MANTEUFFEL, EDWIN HANS KARL, Baron von, b. Magdeburg, 1809; entered a military career by joining the dragoon guards, April 29, 1827; and became second lieut. the following year. He displayed an industrious character allied with considerable capacity, and interested his superior officers to that degree that he was sent for two years (1834–36) to the general military academy. In two years following he acted as regimental adjutant, being named adjutant to the 2d brigade of cavalry guards, Oct. 18, 1839. From 1840–48 he was in the immediate service of prince Albrecht, but in the latter year was transferred to that of the king, with the rank of adjutant of the wing, being made a major in 1852, and lieut.col. in 1853. He was now placed in command of the 5th uhlan regiment; and in 1854 of the 3d cavalry brigade. His advancement continued to be rapid, and in 1858 he was made maj.gen., in 1851 adjutant-gen., and in the autumn of the latter year lieut.gen. In 1864 gen. Manteuffel was engaged in the Sleswick-Holstein war, was present at the battle of Missunde, and commanded in the engagements and movements which resulted in the occupation of Jutland. After the close of this war he was employed in effecting a solution of the difficulty between Austria and Prussia, and arranged for the convention of Gastein, by which this was brought about. He was now made governor of the duchy of Sleswick, with command of the Prussian troops in Holstein and the marines stationed at Kiel. In 1866 the war between Prussia and Austria broke out, and Manteuffel was ordered into active service. At midsummer he was commanding in chief the army of the Maine, and fought at Hemstadt, Vettingen, Rossbrunn, and Würzburg; receiving from the king for his services the order of merit. At the close of the war he was sent to St. Petersburg on a diplomatic mission, and on his return was made general-in-command of the troops in Sleswick-Holstein, being advanced to the rank of general of cavalry, and a month later made commandant of the 9th army corps. In 1868 he was placed in command of the 1st army corps, and was engaged in the Franco-German war. His corps was under fire at Courcelles and Noisseville, directed the evacuation of Metz and the disposal of the prisoners, and then re-entered active service in a campaign against gen. Bourbaki. Later he operated against the south and south-east armies of the French, and performed most brilliant and effective service. In 1872 gen. Manteuffel was invested with the insignia of the order of the Black Eagle, and was afterward made field-marshal gen., and aid-de-camp gen. to the emperor.

MANTEUFFEL, OTTO THEODOR, Baron von, b. Prussia, 1805; studied jurisprudence at Halle, and in 1827 became a minor magistrate at Berlin. When count Brandenburg undertook the suppression of the revolutionary movement of 1848, Manteuffel was made minister of the interior. In this office he displayed a high order of executive ability, and gained the confidence of the middle classes. In 1850 he took office as minister of foreign affairs. Two years later he was appointed president of the council of ministers, and in 1856 he was sent to Paris as one of the plenipotentiaries to negotiate a peace. He retired from the ministry in 1858.

MAN'TIDÆ. See MANTIS.

MAN'TIGER, or MANTÈGRE, a monster with the body of a tiger, the head of an old man, and long spiral horns. It is one of the imaginary creatures known in heraldic blazon, and is variously represented, sometimes with the horns of an ox and feet of a dragon. The supporters of the earl of Huntingdon are mantègres without horns.

MANTINE'A, anciently a city of Arcadia, in the Peloponnesus, on the borders of Argolis. It was situated on the river Ophis, in the midst of a broad plain, and was famous as being the scene of several battles, of which the most important was that fought between the Spartans and the Thebans under Epaminondas (362 B.C.), in which the former were defeated. Its site is now called *Palæopoli.* Some ruins still remain, the principal of which are those of a theater whose diameter was 240 feet. See col. Leake's *Travels in the Morea* (Lond. 1830).

MANTIS, a Linnæan genus of orthopterous insects, which included not only those now constituting the family *mantidæ,* but also the *phasmidæ* (leaf-insects, specter-insects, walking-stick insects, etc.). All of them are of very remarkable forms. The mantidæ have a narrow, compressed, and elongated abdomen, and a long thorax, which consists almost entirely of the first segment. The head is triangular, with large eyes, three small stemmatic eyes, and rather long bristle-like antennæ. The wings fold in a fan-like manner, and the wing-covers are long, narrow, and thin. The second and third pair of legs are long and slender, and are used only for locomotion; the first pair are chiefly used as weapons of combat and instruments of prehension, and have the *coxa* unusually long and large; the *femur* also long and large, compressed, and capable of closing on the *coxa,* so that the sharp edges cut like a pair of scissors. The mantidæ feed on other insects, and remain long fixed in one position, moving their fore-legs in the air to catch prey, which has led to a superstitious regard for them as *praying insects,* and to many foolish notions and legends concerning them. One species (*M. religiosa*) is plentiful in the south of France and in Italy, and others are frequent in warmer parts of the world. The mantidæ not only lie in wait for prey, but move about in quest of it, moving slowly, and advancing stealthily on the victim. Many of them are large insects. Some of the South American ones are 4 in. in length. They are all of very pugnacious disposition, the combat generally terminating in the decapitation of one of the combatants, or the divid-

ing of its body in some part by the legs of the other; and the victor enjoys his triumph in eating the vanquished. In China and some other parts of the east, these insects are kept in cages, and set to fight with each other for the amusement of the beholders. Some of the mantidæ (genus *empusa*) have the forehead produced into a horn.

MANTLE, a long flowing robe, worn in the middle ages over the armor, and fastened by a fibula in front, or at the right shoulder. The mantle is an important part of the official insignia of the various orders of knighthood. Ladies of rank wore similar mantles, in many instances decorated with heraldic charges, in which case the mantle bore either the impaled arms of the lady and her husband, or her husband's arms only. A number of examples may be seen in monumental effigies.

MANTLET, a sort of temporary fortification intended to protect the men working guns in embrasures, casemate, or port-holes from the bullets of sharp-shooters. The mantlet is usually made to be hoisted up while the gunner takes aim, and then lowered to cover the whole opening except a circular aperture for the muzzle of the cannon. With every increase in the range and precision of small-arms, mantlets become more essential for the safety of gunners. Mantlets are made of thick fir, of solid oak planks, or of iron plates, the last being preferable, as the lightest. At Sebastopol, the Russians effectively blocked their embrasures by thick mantlets of plaited rope suspended freely. A mantlet of planks or iron plates, about 5 ft. high, and occasionally mounted on small wheels, is also used to protect sappers working at the end of a sap, although a rolling gabion is preferred for this purpose by many engineers.

MANTLING, or LAMBREQUIN, a heraldic ornament depicted as hanging down from the helmet, and behind the escutcheon. It is considered to represent either the cointise, an ornamental scarf which passed round the body, and over the shoulder; or the military mantle, or robe of estate. When intended for the cointise, it is cut into irregular strips and curls of the most capricious forms, whose contortions are supposed to indicate that it has been torn into that ragged condition in the field of battle. When the mantling is treated as a robe of estate, the bearings of the shield are sometimes embroidered on it. A mantling adjusted so as to form a background for the shield and its accessories, constitutes an *achievement of arms*. It is not till the latter end of the 14th c. that the mantling appears as a heraldic ornament on seals. In British heraldry, the mantling of the sovereign is of gold lined with ermine; that of peers, of crimson velvet lined with ermine. Knights and gentlemen have generally crimson velvet lined with white satin; but sometimes the livery colors (see LIVERY) are adopted instead, as is generally the practice in continental heraldry.

MANTUA (Ital. *Mantova*), an ancient city of Lombardy, and formerly capital of a duchy of same name, but now belonging to the kingdom of Italy, is situated in lat. 45° 9′ 34″ n., long. 10° 48′ 1″ e. Its pop. (1871) of 26,687 comprises a number of Jews, whose commercial influence and social privileges are more extensive in this city than in any other of Italy. Mantua occupies two islands formed by branches of the Mincio, the waters of which surround the city, with the additional defense of swamps or marshy lakes. It is the most strongly fortified town in Italy, but, owing to its situation, is extremely unhealthy—a fact evinced by the pallid faces of the inhabitants. There are five gateways leading into the city, one of which, *La Porta dei Mulini*, deserves examination. The fortifications of Mantua, including its vast citadel, present such a combination of defensive resources, that its regular investment could only be effected by a numerous army; and its reduction even then would be impracticable, except by famine. It forms one of the four fortresses of the Quadrilateral, which, by the treaty of Villafranca, remained in the hands of Austria. The streets of Mantua are spacious and regular, but indifferently paved; the squares are numerous and fine. Some of the public buildings are splendid, both from the massive grandeur of their proportions and the novel beauty of their architecture. The inadequate population of Mantua, added to the somber character of its feudal structures, imparts to the city an air of gloomy decadence, except in the central commercial quarters, and the populous animated *Ghetto* or Jewish quarter, still subject to inclosure. The ancient ducal palace, or Castello di Corte, a vast irregular pile of building, was the state residence and fortress of the Gonzagas, by whom it was erected, and now serves as a state prison and for public offices. The adjoining sumptuous edifice, which now comprises the *Palazzo Imperiale*, the *Palazzo Vecchio*, and the *Corte Imperiale*, or Provincial Tribunal, was originally planned and begun by Buonacolsi, the feudal lord of Mantua, in 1302; it contains 500 rooms, including a magnificent suite of state apartments, whose choicest embellishment consists of the paintings and designs of the great Mantuan artist, Giulio Romano. The cathedral of San Pietro, also designed by G. Romano, contains some fine frescos. The churches of San Martino and Sant' Egidio are of great antiquity—the former dating from 528, and the latter from 568. The province of Mantua had a high reputation in the time of the Romans. After sharing the fate of the rest of northern Italy, it was seized by the Gonzagas about the commencement of the 14th century. The last duke of the house of Gonzaga died childless at Padua in 1708, when Mantua fell into the hands of Austria. Austria gave it up with her other Italian possessions in 1866.—Mantua is capital of a province of the same name, with an area of 855 sq.m.; pop. '72, 288,942.

MANU (from the Sanskrit *man*, to think; literally, the thinking being) is the reputed author of the most renowned law-book of the ancient Hindus; and likewise of an ancient Kalpa work on Vedic rites. It is matter, however, of considerable doubt whether both works belong to the same individual, and whether the name Manu, especially in the case of the author of the law-book, was intended to designate an historical personage; for, in several passages of the Vedas (q.v.), as well as the Mahâbhârata (q.v.), Manu is mentioned as the progenitor of the human race; and in the first chapter of the law-book ascribed to him, he declares himself to have been produced by Virâj, an offspring of the Supreme Being, and to have created all this universe. Hindu mythology knows, moreover, a succession of Manus, each of whom created, in his own period, the world anew after it had perished at the end of a mundane age. The word Manu—kindred with our "*man*"—belongs therefore, properly speaking, to ancient Hindu mythology, and it was connected with the renowned law-book in order to impart to the latter the sanctity on which its authority rests. This work is not merely a law-book in the European sense of the word: it is likewise a system of cosmogony; it propounds metaphysical doctrines, teaches the art of government, and, amongst other things, treats of the state of the soul after death. The chief topics of its twelve books are the following: 1. Creation; 2. Education and the duties of a pupil, or the first order; 3. Marriage and the duties of a householder, or the second order; 4. Means of subsistence, and private morals; 5. Diet, purification, and the duties of women; 6. The duties of an anchorite and an ascetic, or the duties of the third and fourth orders; 7. Government, and the duties of a king and the military caste; 8. Judicature and law, private and criminal; 9. Continuation of the former, and the duties of the commercial and servile castes; 10. Mixed castes and the duties of the castes in time of distress; 11. Penance and expiation; 12. Transmigration and final beatitude. The text of this work has been published in several editions both in India and Europe. An excellent English translation of it we owe to sir W. Jones (2d ed., by Haughton, London, 1825), and a very good French translation to A. Loiseleur Deslongchamps (Paris, 1833).

MANUAL, in military language, is an exercise with the musket or rifle, through which recruits are drilled, to give them a free use of their limbs, and of the weapon regarded merely as a pike. It comprises the first course of instruction after the rifle has been placed in the learner's hands.

MANUEL I, COMNENUS, Emperor of Constantinople, and fourth son of the emperor Calo-Joannes, was born about 1120, and succeeded his father in 1143. He became at once involved in an uninterrupted series of wars both with the eastern and western nations, and greatly distinguished himself by his courage and heroism. In 1144 Raymund, prince of Antioch, who had thrown off the Byzantine yoke, was compelled to submit again to vassalage; and in the following year the Turks, who had invaded Isauria, were paralyzed by repeated and decisive defeats. In 1147 the crusaders, under Louis VII. of France and Conrad III. of Germany, marched through Manuel's dominions without hindrance on his part, as he was at this time preparing for his notable contest with Roger, king of Sicily, for the possession of Greece. At first this contest was highly favorable to Manuel; but after the death of Roger the fortune of war changed, and peace was concluded in 1155. The rest of his life was spent in wars with the Hungarians and Turks. He died Sept. 24, 1180.

MANUEL II., PALÆOLOGUS, Byzantine emperor, 1348–1425, succeeded his father, John VI. He had been an associate in the empire in 1372. At the death of his father in 1391, being held as a hostage by sultan Bajazet, he escaped from Nicæa to Constantinople, his own capital, to secure the throne for himself, without informing the sultan. Bajazet, enraged at his breach of faith, marched against him, ravaged the country adjoining Constantinople, and invested the city by sea and land. Manuel applied to the western princes, who sent him an army of 100,000 men under Sigismund, king of Hungary, and John, count of Nevers. The allies, at first successful, were defeated with great slaughter by Bajazet at Nicopolis in 1396, with the loss of 10,000 men. Bajazet then returned to the siege with greater vigor than before. Seeing the determination of the citizens to hold out, he made a private agreement with John, Manuel's nephew, to place him on the throne of Constantinople, and John was to deliver up the city to the Turks, and remove the imperial seat to Peloponnesus. He sent also deputies to the inhabitants, proposing to withdraw his army provided they expelled Manuel and placed John upon the throne. Manuel voluntarily resigned, received John into the city, conducted him to the palace, and then set sail for Venice to ask aid from the western princes against the Turks. Large supplies were promised. The citizens of Constantinople refusing to comply with such a base treaty, the siege was renewed, and its fall imminent when Bajazet was called away to resist Tamerlane. He raised the siege and went against Tamerlane with a large army, but was defeated at Angora, 1401, and taken prisoner. After the defeat and death of Bajazet in 1403, Manuel reigned in peace. He was succeeded by his son John VII., Palæologus.

MANUFACTURES (from Latin *manus*, a hand, and *facio*, I make). Bearing the significance which it gained with its derivation, this word describes the first structures, processes, and compositions designed by the mind of man, and executed by his hand labor, with more accuracy than it does the accomplishment of the machinery of the

present day, to which it is more generally applied. The first articles of manufacture must have been such as could be successfully employed for procuring the necessaries of life; and, in fact, the first of such articles that have been discovered, representing the earliest ages of man's existence upon earth of which any traces remain, have been rude mills for grinding grain; knives and other offensive weapons for destroying game; fish-hooks; pointed implements, which evidently filled the place of needles; and stone hammers, axes, chisels, and other tools, used for building purposes (see LAKE DWELLINGS; LABOR). The processes to enforce nature and render its powers applicable to the preservation of human life were therefore, and in this order, the acquisition of food; the clothing of the body to protect it from the elements; and the erection of dwellings, partly for the same purpose, and partly for safety against wild and dangerous animals, and human foes hardly less dangerous in their savage condition. And it is to be observed that the ingenuity and toil of man have ever since been devoted to these purposes; added to which have been the necessities arising from improved or extended mental conditions, and the spread of wants in a direction other than material. Manufactures have therefore included food-processes, the manipulation of fabrics, and building-construction; to which have been added, in the course of time, the art of war, the arts of design, and applied science, as agencies to fulfill the duties imposed by an ever-changing and ever-advancing civilization. It is one of the fortunate incidents of human history that with few exceptions the processes of labor applied to the manufactures may be traced even in our day as these existed at the very beginning. It is possible to follow any art to its inception, and to trace its history to the first rude efforts of primeval man, with a considerable degree of accuracy, affording, when the results of such an investigation are brought into juxtaposition, a comprehensive view of the entire field of human art. Such investigations have been made, and their collected results exist in the industrial museums of Europe and America. Remarkable also is the occurrence of the earliest methods in use in the arts, in actual practice among savage and semi-civilized races in different parts of the world in our own time. The natives of Central and South America, Africa, and certain parts of Asia still employ the same processes in agriculture that were in use thousands of years ago; mills of the same character as those used by the Egyptians many centuries before the Christian era are still in active employment in northern Africa; and pottery of the same design and fashioned after the same methods and with the same tools as among the earliest races, are still made by their descendants in different parts of the world. And while we may thus view at one glance, in operation, methods and tools divided in actual history by many centuries, we are also enabled to follow the progress of the arts and manufactures, their improvement or their decadence, through existing specimens of workmanship. From the beginning in the aggregate—whatever may have been the case with certain nations or races—man seems to have been impressed by a restless spirit, and to have been continually provoked to an active ingenuity in labor. The very first instances of handiwork that have come to our knowledge through the labors of explorers have illustrated the impulse towards improvement. From the stone age to the neolithic, and from that to the age of iron—as we generally record our evidences of these periods—the progress not only in excellence of workmanship, but in beauty, is remarkable. And while it is easy to understand the mental processes that induced endeavor after a higher quality of article when the improvement represented a practical good to be achieved, it is necessary for us to reconcile our ideas of prehistoric man with the fact that he was influenced by a leaning towards the æsthetic, and that even so early he showed signs of struggling toward an improved art-taste. The fact is important that in all the history of manufactures the beautiful has been allied with the practical, with a persistence which seems to have the character of a law.—The next important tendency to be observed in viewing the history of manufactures is that of applying the forces of nature to the reduction of human labor. As it is to this tendency that we owe the inventions which so extended the scope of the arts, its importance will hardly be underrated. Yet it is to be observed that in the beginning the forces of nature, expressed and operative through such rude mechanical devices as were at first invented, were called into operation only when the power of man had proved unequal to the task in hand. Man labored to the extent of his capacity, and only then supplemented his own efforts by the employment of the mechanical powers. There is nothing therefore inexplicable in the fact that while we know the ancients possessed a knowledge of the more hidden forces, and the means to apply them, they did not make use of these in instances where they might, but seem to have preferred the exercise of human force and ingenuity. A noble ambition appears to have influenced man in those early days; impelling him to push to the utmost his individual capacity; and to place upon record, by means of his work, the comprehensive nature of man's ability, his power to meet emergencies, his control, within himself, of a microcosm representing all the possible constructive capacity of the entire world of mechanism. The arts of Greece and Rome, of Babylon and Nineveh, Carthage and Phenicia, as these have been preserved to us, sufficiently illustrate this phase of our subject. But the concentration cut of which grew marvelous excellence presently ceased to exist; the fall of Nineveh, Carthage, Greece, and Rome, the inroads of barbarians, and the distribution of power over the face of Europe, blotted out for the time all progress in the arts; and the "dark ages" settled down upon civilization through a gloomy period of centuries, to the utter

check of improvement, and to the destruction of the arts and manufactures, except so far as these contributed to positive necessities and to sensual desires. Out of this period of inaction and stagnation of creative ability, civilization burst forth in the 13th c., beginning the "middle ages" and the *renaissance*, a time when man reached the highest pitch of skill in hand-work, and when manufactures attained an excellence in beauty, capacity for service, and durability, which they have never since surpassed even if they have approached. The history of the arts and crafts of Europe in the middle ages shows a surprising advance in all directions. The progress in merit in the fine arts has been fully recognized, and this was reflected in the condition of the crafts and the improvement in manufactures. Directly we see it in the wood-carvings of Brabant, Flanders, and Italy; in the wonderful art displayed in the manufacture of fictile ware; in the form given to bronze, iron, and brass; and in the intricate and beautiful carving of ivory. The most magnificent armor, displaying workmanship of exquisite beauty, is of this period. And so the most commonplace objects—the ordinary utensils of the household, the very architecture of the houses themselves—reflected the splendid genius of the masters of art. And above all, we are bound to consider the honesty of the workmanship peculiar to those days. The linen and wool fabrics of Holland and Flanders have never since been improved upon. The heavy and costly damasks and satins and silks and velvets, which played so large a part in the costumes of the period, were honest stuffs, whose lasting as well as artistic qualities cannot be gainsaid. The furniture of the period was solid and firmly put together, besides being ornamented and decorated with correct taste and refined sentiment. In the reign of king John in England, the wealthier classes used iron chandeliers and candelabra, and each of these was finished and shaped by hand with the hammer and with the truest art-taste. The story of the Della Robbias, and their labors in search of a special glaze for china, is equaled only by the later story of Bernard Palissy, whose struggles after the same secret, lost again, have furnished the material for many a book. In those days the blacksmith, and the cordwainer or shoemaker, was as proud of his skill, and as earnest in the fulfillment of what he deemed his obligation to his craft, as was the most esteemed artist of Florence or Venice under the patronage of the Medici. Faust, who became a printer, was a goldsmith in Mentz; Hans Sachs was a cobbler; Benvenuto Cellini was a gold and silver smith; Andrea del Sarto, the painter, was a goldsmith's apprentice; and Ghiberti, who executed the two gates of the baptistery in Florence, which Michael Angelo said were "worthy of Paradise," was the son of a goldsmith. Thus, at that time, art and manufacture went hand in hand; the union of the beautiful and the useful being considered not only desirable, but incumbent on the artificer as a part of his trade.

The conditions of labor in Europe, and therefore those of the manufactures, changed materially during the period between the 16th and the 18th centuries. The combinations of workingmen into guilds, and the wealth and power to which these attained, brought about the introduction of the force of *capital*, by the concentration of great wealth in a few hands; and the application of this force to manufactures on an enormous scale was brought about by the application of power to machinery, and the establishment of the factory system. From this moment, not only the system of manufacturing, but the character of the workmanship, and of artisans, the nature and amount of the demand for manufactures, the methods of supply, and the modes of transportation, altered throughout the civilized world. The history of manufactures fell under the influence of the invention and application of machinery, to which the arts of design necessarily played a secondary part. From 1771, when the first mill with water-power, and Arkwright's machinery, was set up in England, to 1835, the number of operatives employed in the factories of the United Kingdom had grown to 354,684, of which number 195,508 were females. In 1856 the number of operatives was 682,497, of whom 409,300 were females, 25,982 being under 13 years of age. The number of factories, between 1838 and 1856, increased 28 per cent; the amount of power increased 63 per cent; and the number of hands employed, 80 per cent. In 1786, in every $200,000,000 in value of the product of manufacture in France, 60 per cent of the cost was for labor, and 40 per cent for raw material. In 1876 this condition was exactly reversed, 40 per cent only of the cost being for labor, and 60 per cent for raw material. In 1876 the total industrial product of France was valued at $2,400,000,000. These few figures are offered merely for their suggestive value; the statistics of the different articles of manufacture, and in different countries, will be found under their proper titles; see COTTON, LINEN, HATS, etc.

Beverley, in his *History of Virginia*, writing in 1705, refers thus to the dependence of the American colonists upon other nations to supply their wants: "They have their clothing of all sorts from England, as linen, woolen, and silk, hats and leather; yet flax and hemp grow nowhere in the world better than here. Their sheep yield good increase and bear good fleeces, but they shear them only to cool them. The mulberry-tree, whose leaf is the proper food of the silk-worm, grows there like a weed, and silk-worms have been observed to thrive extremely, and without hazard. The very furs that their hats are made of, perhaps, go first from thence. The most of their hides lie and rot, or are made use of only for covering dry goods in a leaky house. Indeed, some few hides, with much ado, are tanned and made into servants' shoes; but at so careless a rate that the farmers do not care to buy them if they can get others; and sometimes, perhaps, a

better manager than ordinary will vouchsafe to make a pair of breeches of deerskin. They are such abominable ill-husbands, that though their country be overrun with wood, they have all their wooden-ware from England; their cabinets, chairs, tables, stools, chests, boxes, cart-wheels, and all other things—even so much as their bowls and birchen brooms—to the eternal reproach of their laziness." From which emphatic narrative by an eye-witness it will be inferred that the standard of manufactures in the country under consideration, a century and three-quarters ago, did not offer promise of the results reached at the present time. The first attempt at ship-building in the colonies was in the construction of the *Onrest* in 1614 at Manhattan river. She was 16 tons burden, 38 ft. keel, 44½ ft. long, and 11½ ft. wide. In her, in 1616, capt. Wilkinson discovered the Schuylkill river, and explored nearly the entire coast from Nova Scotia to the capes of Virginia. The saw-mill is said to have been introduced into Massachusetts in 1633, some years before it was used in England. And as late as 1767 a saw-mill was destroyed in the latter country by a mob, because it was supposed to be destructive to the work of the sawyers. In 1641 the general court of Massachusetts passed an act to the effect that there "should be no monopolies but of such new inventions as were profitable to the country, and that for a short time only." Saw-mills were introduced by the Dutch in New York as early as 1633, and seem to have been used there also for grinding-mills. The erection of these mills brought about an improvement in house-building, which had previously amounted only to the construction of huts or wigwams. The first brick-kiln in New England was set up in Salem, Mass., in 1629. In New York bricks were imported from Holland, until governor Stuyvesant introduced the industry. There were certainly tanners, cart-makers, glovers, furriers, and shoemakers in the colonies about the middle of the 17th c., despite the assertion of Beverley, whose observation, however, was probably confined to Virginia.

In the manufacture of fabrics the early colonists used the distaff and spindle, soon superseded by the spinning-wheel. The British in those days, seeking to force the colonists to buy everything in the home market, threw every possible obstacle in the way of domestic manufactures. Early in the 18th c. spinning-schools were started in Boston, and special taxes were imposed for their support. During the revolutionary war the colonists depended on their own exertions for clothing and other necessities, and Hargreave's and Arkwright's inventions were not permitted to be introduced across the Atlantic, so jealous were the British of the trade in their manufactures. Despite all their efforts, however, a cotton-factory was established at Beverly, Mass., in 1787; of Arkwright's machines, the first used in the United States was in a mill at Pawtucket, R. I., in 1790. The first cotton-mill ever built in the world, which combined all the requisites for making finished cloth from raw cotton, is said to have been erected in Waltham, Mass., in 1813. Our colonial ancestors usually obtained their furniture from England, the most of it, of the best class, being made of mahogany and oak. At first the articles made in the colonies were of the rudest character, and constructed of native woods. Later on, a South American and West India island trade sprang up, and mahogany and rose-wood were imported, and worked up into bedsteads, sideboards, and cupboards. The first nails made in the colonies were manufactured by hand, and it was customary among the country people to erect forges in the chimney-corners, and in the long winter evenings to make quantities of nails—even the children taking a share in the labor of this industry. About 1790 a machine for cutting and heading nails was invented by Jacob Perkins of Newburyport, Mass., which is said to have had a capacity of 10,000 nails per day. Another machine, invented by a citizen of Bridgewater, Mass., made, in 1815, 150,000,000 tacks. The introduction of the manufacture of glass into the American colonies was contemporaneous with the settlement of the country; the first glass manufactory being set up in the woods about a mile from Jamestown, Va., in 1607. In 1621 a fund was subscribed to establish a factory of glass beads, to be used as currency in trading with the Indians for furs. The first glass manufactory in Massachusetts was established at Germantown, near Braintree, for glass bottles alone. In 1639 a glass-house was set up in Salem. In 1752 the general court of Massachusetts passed an act granting the sole privilege of making glass in the province to Isaac C. Wesley. A glass-house existed in Philadelphia in 1683. Pottery was brought out from England and Holland by the first settlers, but the early colonists used wooden dishes and pewter platters. Some pottery was made by the Plymouth, Jamestown, and Manhattan colonists. In 1819 the manufacture of fine porcelain was commenced in New York, and in 1827 it was made in Pennsylvania. The manufacture of hats was considered of importance by the colonists, and in 1662 the colonial government of Virginia offered a premium of 10 lbs. of tobacco for every hat made in the province. Protection was early applied to the raw material of this industry, and in 1675 its exportation was prohibited. Before 1800 this manufacture was conducted in nearly every state in the union, and by the census of 1810 returns were made of the manufacture of hats to the amount of $4,323,744.

Silk-worm culture was proposed by James I. on the settlement of Virginia, and that monarch sent supplies of silk-worms' eggs to the colony from his private stores. In fact, more or less silk was raised in all the colonies. In 1788 the president of Yale college wore at commencement a silk gown made from materials raised and woven in Connecticut. A piece manufactured from silk raised near Charleston, S. C., in 1755, was made into three dresses, one of which was presented to the princess dowager of Wales, another

to lord Chesterfield, and a third to Mrs. Harvey of South Carolina, in the possession of whose family it still remains. In 1837 the manufacture of silk in the United States received a powerful impulse from a report of the congressional committee on manufactures in favor of this industry. It was stated that one specimen of the *morus multicaulis*, or mulberry, would sustain a sufficient number of silk-worms to raise 120 lbs. of silk, worth $640. Attention was directed to this industry in nearly all the states, and a condition of excitement occurred which became intensified by the promise of large fortunes. In the following year this excitement culminated in a degree perhaps never equaled by any similar movement, except the great "tuber" or bulb excitement in Holland and England. Single mulberry-trees sold at $10, nurseries were established and did a thriving business, and thousands of persons invested in the new speculation. Two years later a revulsion of interest occurred. Most of the nurseries were abandoned or destroyed, and *morus multicaulis* trees, healthy and well-branched, were offered at three cents each without finding buyers. See SILK.

The manufacture of ladies' shoes began early in colonial times, and the town of Lynn, Mass., has been distinguished for this branch of industry almost from the time of its settlement. The first shoemakers in Lynn were established in 1635, and the first shoes made by them were of woolen cloth or neat leather only. Until 1800 shoes were made with wooden heels, covered with leather, but after that time leather heels were substituted. The first invention of importance in this manufacture was the pegging machine; the next was the last-machine invented by Elias Howe. Another important invention was the McKay sewing machine, for stitching the uppers and soles together. In 1870 Lynn produced 187,530 cases of boots and shoes, of 60 pairs each, being 11,250,000 pairs, valued at $17,000,000. An important manufacture, and one which is now more than a century old in the United States, is that of combs. These were at first imported from England by the colonists, but in 1759 an iron comb manufactory was in existence at West Newbury, Mass., where the business is still extensively conducted. In the same year there was a comb manufactory in Pennsylvania, and in 1793 one in Boston, and two or three in Leominster, Mass. The first machine for making combs was patented by Isaac Tryon in 1798. In 1809 three manufactories were established in Connecticut. At first the teeth were cut singly by a fine steel saw; but in 1814 a patent was granted for a machine which cut all the teeth at one operation. The invention of vulcanized India-rubber effected a revolution in the comb manufacture. An important manufacture is that of the cards used in the manufacture of cotton and woolen cloths. During the colonial period these cards were manufactured by hand-labor; and in that form their making continued to be a valuable branch of industry until the latter part of the 18th century. In 1777 Oliver Evans invented a machine for making cards, which is said to have produced them at the rate of 300 a minute. In 1784 another machine was invented which cut and bent the teeth, and had a capacity of 86,000 an hour. Cannon and cannon-balls were cast in Massachusetts as early as 1664. In 1748 a foundry at Bridgewater, Mass., made from 3 to 42 pounder guns; and during the revolution, cannon, cannon-balls, and shells were made in Massachusetts, Rhode Island, Connecticut, New Jersey, Pennsylvania, and Maryland. Up to 1857 about 300,000 cannon had been cast in the United States. The manufacture of wall-paper did not begin in the United States until 1765, and in 1789 a production of 16,000 pieces per month in Philadelphia was considered a fair quantity. The first patterns with glazed grounds were made in 1824, but soon after the best French designs began to be imitated. The manufacture of iron was naturally one of the earliest industries practiced in the colonies. In 1620 there were iron-works at Falling Creek, in the Jamestown, Va., settlement, but the following year the place was attacked by Indians, and the inhabitants massacred, which stopped the manufacture of iron in that locality, and it was not resumed there until 1712. The first iron manufactory in Massachusetts was set up in Lynn about 1663, the village about the works being named Hammersmith, after the place of the same name in England, whence many of the workmen employed there had emigrated. The first article of iron said to have been cast in the American colonies was made at these works, being a small iron pot capable of holding about a quart. In 1750 there were in existence in the colonies 3 iron-mills and one furnace. The description of a furnace erected in 1794 in the town of Carver, Mass., mentions that 10 forges were there employed in making bar iron from scraps to the amount of 200 tons annually. Another of the early colonial industries was the manufacture of cordage, and as early as 1631 it was made in Boston, and in Charlestown, Mass., in 1662; in 1698 there were several rope-walks in Philadelphia; and in 1794 Virginia and Maryland had each more rope-walks than any two of the northern and eastern states. In 1804 a spinning and twisting mill for making cordage was patented in the United States. The first paper-mill in America of which we have any account was erected at Roxborough, near Germantown, in Pennsylvania, about 1693. This was 50 years after printing had been introduced into the colonies, but only 5 or 6 years after a proclamation had been issued by the English government for the establishment of the first manufactory of white paper in England. The paper-mill in question was built by an ancestor of David Rittenhouse—whose family in Holland had long been engaged in the manufacture of paper—and William Bradford, the first printer in Philadelphia. In 1728 Bradford, when government printer in New York, owned a paper-mill in Elizabeth-

town, N. J., which was probably the second one erected in the colonies. Benjamin Franklin was, at various times, interested in the erection of 18 paper-mills. In 1787 there were 63 mills in operation in all the states. It is said that the first manufacture known to American history was that of salt, which was undertaken by the colonists at Jamestown, Va., in 1620. The first mill set up in New England was a wind-mill, near Watertown, Mass., which was taken down in 1633 and erected on Copp's hill in Boston. In New York the first mill was a horse-mill, which was built in 1626 on the site now occupied by Trinity church in that city. Agricultural implements were not made in America until a comparatively recent period. One of the first persons to make a plow was Thomas Jefferson, who attempted to solve the mathematical problem of the true surface of the mold-board, and in 1793 had several plows made after his patterns, which he used on his estates in Virginia. The first American, after Mr. Jefferson, who made plows for common use was a farmer living in New Jersey, by the name of Charles Newbold, who invented the first cast-iron plow made in America. The manufacture of beer was undertaken in the very earliest history of the colonies. One John Appleton set up the first malt-house in Massachusetts in 1640. In 1633 Wouter Van Twiller caused the erection of a brewery in New York city. The distillation of brandy commenced in the colonies in 1640. Wine was made in Virginia from the native grape by French colonists, who came over for the purpose, before 1622. In New England governor Winthrop planted a vineyard as early as 1630, and Governor's island, in Boston harbor, was granted for this purpose in 1634.

The first cloths ever made in the colonies were the result of a bounty offered by the general court of Massachusetts in 1640. In the following year this bounty was given to several persons who made attempts at this manufacture; probably, at first, a coarse description of linen. The first systematic effort at the manufacture of woolens was by a company of Yorkshire men in 1644 at Rowley, Mass. At this period cotton was obtained from Barbadoes, while hemp and flax were native. Cotton seeds were first planted in the colonies in 1621; the plant was introduced into the Carolinas in 1666. It was grown only as a garden-plant, however, until after the revolutionary war. The first exportation of raw cotton occurred in 1754. In 1775 a corporation was formed in Philadelphia called the "United company of Philadelphia for promoting manufactures," of which Dr. Rush was president. Its object was "to establish American manufactures of woolens, linens, and cottons, with a view to the exclusion and supersedure of British goods." The company possessed a spinning-jenny, newly imported from England, and employed in their factory 400 women. Two years later this company contracted with congress to supply clothing for the army.—A report made to the British house of commons in 1731, by the board of trade, on colonial industries, stated that in the American colonies the settlers had "fallen into the manufacture of woolen cloths and linen cloths, but for the use of their own families only; that the very high price of labor rendered it impracticable for them to manufacture such articles at less than 20 per cent dearer than that exported from England; that the greater part of the clothing worn in the province of Massachusetts Bay was imported from Great Britain, and sometimes from Ireland; that there were a few hat-makers only in the maritime towns; that there were no manufactures in New York worth mentioning, or in New Jersey; that the chief trade of Pennsylvania lay in the importation of provisions, no manufactures being established, and their clothing and utensils for their houses all imported from England; that in Massachusetts Bay some manufactures were carried on, as brown holland for women's wear, which lessens the importation of cloaks and some other sorts of East India goods." This report, in view of what has been heretofore stated, will be seen to exhibit a desire to underrate the manufacturing industry of the colonies; which was, however, already encroaching seriously upon the demand on the home market.

This brief statement concerning the early history of American manufactures is chiefly of interest in displaying, by contrast, the vast movement which took place in the century following the revolutionary war. In the United States, as elsewhere throughout the world, the organization of local, national, and international exhibitions has forwarded this movement with a rapidity and a result of excellence otherwise unattainable.

The gross statistics of manufacturing in the United States were given in the U. S. census for 1870 as follows:

Establishments	252,148	
Steam-engines—Horse-power	1,215,711	2,346,142
Water-wheels— "	1,130,431	
Hands employed—Males above 16	1,615,598	1,939,368
" " —Females above 15	323,770	
Capital	$2,118,208,769	
Wages	775,584,343	
Material	2,488,427,242	
Products	4,232,325,442	

The increase in the different elements of this manufacturing industry as between 1850–60 and 1860–70 was as follows.

	Percentage of increase 1850–60.	Percentage of increase 1860–70.
Establishments	14 per ct.	80 per ct.
Hands employed	37 "	33 "
Capital	Doubled.	Doubled.
Wages	60 per ct.	More than doubled
Material	More than doubled.	" "
Products	85 per ct.	2⅓ times greater.

The approaching publication of the U. S. census returns for 1880 will afford material in tabulated form by which it will become practicable to deduce important conclusions, and possibly to establish the existence of positive laws controlling the movement of the manufacturing industry as a whole, and in its relation to the most vital economic interests—not of the laboring classes alone, but of the race.

MANUMISSION, the form by which, in ancient Rome, slaves or other persons not *sui juris*, were set free. There were three ways in which the release might be accomplished, viz., by *vindicta*, census, or will. The oldest of these forms was the *vindicta*, which was as follows: The owner of a slave brought him before a magistrate and made a statement of the grounds upon which he proposed to make him free. Then the lictor laid a rod on the head of the slave and declared him free, the master pronouncing the words "I wish this man to be free," and at the same time turning him about and letting him go. Then the magistrate proclaimed his freedom. Freedom by census was effected by the slave giving in his name, by direction of his master, at the lustral census. By will a slave could be freed conditionally or unconditionally, or made free and an heir to the testator. The laws at different periods placed restrictions upon the right of the master to manumit his slaves, such as limiting the number he might set free, and preventing him from defrauding his creditors. The manumittor stood to the manumitted in the relation of a patron to a freedman, and if the former were a citizen the latter became a member of his *gens*, and assumed his family as well as personal name, to which he added such surname as pleased him, but commonly that by which he had been known as a slave.

MANURE. This is a term applied to a great variety of substances, mineral as well as organic, which have been used for the purpose of increasing the produce of those plants that man selects for cultivation. Lime, and the ashes of vegetables, have been applied to the land to increase its fertility from time immemorial; so also have all kinds of organic substances, whether vegetable or animal. The rationale of such applications to growing plants was but little understood till chemistry revealed to us the nature of the materials which entered into the composition of all plants. At the present day, much definite knowledge has been acquired of the true nature and action of the various substances that are found to increase the growth of our cultivated crops. It was long supposed that the food of such a varied class of plants as the globe presents must necessarily be very different, almost as much so as the difference in their forms and properties of their products. Chemistry, however, has shown that the food of all plants is very much alike, though some classes must be supplied with certain substances in greater abundance than others. The great mass of all vegetables is resolved into carbonic acid, water, and ammonia, on being subjected to heat or burned in a fire. It is these same substances which constitute the chief food of all plants. The light of the sun enables plants to decompose and assimilate carbonic acid and ammonia, and to manufacture out of them the various products they contain. All organic substances yield these by slow decomposition, as well as by combustion. It is for this reason that such substances increase the fertility of land when added to it. Water is so common an article, that nature provides all that plants require. Carbonic acid, too, is contained in considerable proportion in the atmosphere, and is readily taken from it by the leaves; still, it is of great use when applied to the soil as vegetable matter, and the decomposition rendered accessible to the roots of plants. Ammonia exists in exceedingly sparing quantities in the atmosphere, as well as in rain and river water, so that artificial applications to the soil are generally needed to produce full crops. The nitrogen which enters into the composition of plants is generally supposed to be capable of being only assimilated either in the form of ammonia or nitric acid; it is for this reason that the salts of ammonia and nitric acid are all very powerful fertilizers. They generally produce a dark-green color in the leaves, such as is associated with healthy growth and luxuriance.

But besides carbonic acid, water, and ammonia, plants feed upon certain mineral or earthy substances, which seem to impart the power of condensing and digesting the other organic elements. On plants being burned, they leave lime, potash, soda, magnesia, silica, sulphates, and phosphates, as ash. These substances are all found to exist in certain kinds of plants in proportions which are confined within rather narrow limits. The earthy substances, it must be remembered, enter into combinations in definite proportions with the other constituents, and are thus linked together in the vegetable organisms as part and parcel of their structure.

Lime acts as a manuring substance directly by supplying one of the constituents of plants; so also does magnesia. But lime is often added as an agent to assist in digest-

ing and preparing the organic materials existing in the soil. See LIME. Magnesia is seldom applied singly to the soil; it is usually associated with limestone, and is generally contained in the soil in quantities sufficient for the wants of plants.

Potash is a substance most essential for all our cultivated plants; its market-price, however, is so high, that farmers seldom apply it directly to the soil. They employ certain crops, such as clover and turnips, to gather it up for them in the soil. These are consumed on the farm by cattle and sheep, and as little potash enters into animal tissues as a permanent constituent, it is mostly returned to the dunghill in the excrementitious matters. Farm-yard dung thus possesses a value of its own, by supplying this constituent, which cannot be bought economically in the market. Soda can be easily obtained in the form of common salt, but as this substance is usually associated with potash, the one is found in the dung-heap as well as the other. Common salt is applied to corn-crops that are growing too rapidly. The salt has the effect of stiffening the straw, and rendering it less liable to lodge. Salt is also used with great success in growing mangold-wurzel, as this is a plant which was originally taken from the sea-shore.

Sulphates.—Every plant contains a quantity of sulphur, which is derived from the sulphates that are found in the soil. Sulphate of magnesia has often been applied with marked effect for turnips and potatoes, but its use does not commonly pay the expense of the application. A much cheaper source of sulphur is found in sulphate of lime or gypsum (q.v.).

Phosphates.—These are largely used in agriculture. Phosphoric acid being very sparingly diffused in most soils, many plants have apparently great difficulty in obtaining as much of this material as is necessary to rapid growth, and hence the importance of an artificial supply, which is administered in the form of phosphate of lime. The chief sources of this important element are bones (q.v.), apatite (q.v.), and guano (q.v.). The reason of its importance, and the principle which should guide its application, are explained in the article BONES AS MANURE.

Nitrogenous Manures.—Plants are supplied with nitrogen in the form of nitrates, or of salts of ammonia. Nitrates and the salts of ammonia promote growth in all cultivated plants when the earthy substances that enter into their composition are present. Nitrogenous manures are often beneficially applied without other substances to grain, because the grain-plants have greater facilities than the turnip for taking up phosphates and other constituents from the soil. So also, to a still greater extent, do we see the operation of this principle in the case of grass. Having a permanent staff of roots in the soil, the plants are ready to gather up the necessary supply of mineral food when abundant nitrogenous food is presented to them, and thus nitrogenous manures of all kinds have very marked effects on grass. What determines the amount that can be profitably applied to the different cultivated plants, is simply the capability that each species possesses of expanding under such treatment.

Farm-yard Manure.—This is the most valuable manure that the farmer uses. It contains all the elements of plants, and without its use in ordinary circumstances the fertility of the land would rapidly deteriorate. The richer the food upon which stock is fed so much the richer the manure produced. Stock fed upon straw and water leave a very inferior manure, that requires to be largely supplemented by other materials. Turnips add largely to the value of manure, and oil-cakes of all kinds, from containing nitrogen and the earthy matters of the seeds of oil-bearing plants, produce a rich manure. Farm-yard manure, under ordinary circumstances, is much more valuable for some kinds of crops than for others. The potato, for example, cannot be raised with much success unless it be supplied with this or other bulky manure having the greater number of ingredients present. This does not appear to arise from its absolutely requiring more of any one substance than many other plants that can do far better without artificial supply. It seems to be owing rather to a deficiency of power to gather its food when dispersed through the soil. A large allowance of farm-yard manure is therefore applied to the potato when it is grown in great quantities. The bean, also, is dependent on farm-yard manure more than the pea. Large breadths of turnips are often raised without farm-yard manure, as, when supplied with phosphate and nitrogen, they seem to have greater facilities for taking up what is diffused through the soil. The weaker and poorer the soil the more important does farm-yard manure become for all plants. Farm-yard manure also tends to render soils more adapted for carrying clovers, and many farmers always apply this to lands which are to be sown out in grasses.

Liquid Manure.—This is a favorite manure in many districts. Scotch and English farmers, in general, endeavor to have all the liquid excrements of the stock absorbed by the straw, and carried out in the solid form. On many farms, however, far more is produced than can be absorbed by the straw. Various modes have been adopted to apply it when this is the case. It is commonly done by a large barrel drawn by a horse; the liquid is distributed by various methods as the horse walks over the ground. The liquid manure is commonly applied to grasses, more especially to clovers or rye-grass, common or Italian. As the liquid accumulates it may be applied to the young grasses as soon as the corn crop is removed. The plants, being vigorous in autumn, absorb it, and form roots and juices that are available as soon as the growing season arrives. It may be applied during intervals of mild weather during the whole winter. It is, no doubt, most economical to apply it at the season of growth, as the roots take it up then very readily,

and there is comparatively little waste from being washed out of the soil. In some large establishments the whole urine is collected during the winter in large tanks, and applied in spring. This has been done on a large scale by means of underground pipes laid over the fields, the liquid being distributed by means of a pump and hose. Steam or water power has been in some cases applied to this operation; in others it is effected by gravitation, when the situation of steading and reservoir suits. In wet weather the liquid manure can be put on pretty strong, but in dry weather large quantities of water are added for the purpose of diluting it and not allowing it to injure the plants. Liquid manure is exceedingly rich in all the elements of plants, and is valuable for all crops; but there are often considerable practical difficulties connected with its use and distribution.

MANUSCRIPT, from the Latin *manu scriptum*, written by hand, the original writing of a book, tract, or pamphlet prepared for the press. The ancient manuscripts were inscribed on papyrus, or parchment, and were preserved in sheets or rolled. The Egyptians rolled their papyrus manuscripts with regard only to the length of the subject treated; brief monographs being preserved flat, while treatises of greater length were formed into rolls whose extent was only governed by the comprehensiveness of the subject and the fluency of the writer. Manuscripts on parchment or vellum were at first made in rolls, but about the 3d c. these began to take the form of flat pages, precisely as in our books, and usually quarto in size. Mexican manuscripts when not rolled were folded as we do a map, and had covers of wood for their protection.—The multiplication of manuscripts among the Greeks and Romans, in the absence of any art of mechanical reproduction, became of necessity a matter for system and regularity so far as this was possible. At first, the art of transcribing belonged almost wholly to such among the slaves as became adept in writing. As the system of slavery among those nations was one of minute subdivision into classes, to each of which was allotted a specific kind of duty, this became comparatively easy, certain slaves who displayed facility being specially educated to be copyists. Of course, the value of a slave was increased by his becoming efficient in the practice of this art, and this fact becoming obvious the art was adopted in Rome by persons who became professional transcribers, not being slaves. And as early as the 5th c. this had become a business in which, in some cases, a number of persons were associated together, and these were bound by agreement, and by rules and regulations, formally adopted. The Egyptian papyri were, as a rule, written in black and red, with occasional ornamentation by the use of other colors, and even of gold. Sometimes to these were added pictorial illustrations of remarkable taste and delicacy of execution. Fourth and 5th c. manuscripts have generally the body of the writing in black ink, the initial letters being in red, with some display of ornamentation in form: sometimes several of the beginning words, or even two or three lines, are in red ink. The Arabic, Persian, and Syriac manuscripts are often illuminated, frequently much gold is used, and arabesque designs are common among these: the Koran does not permit the drawing or other representation of the human figure, and this character of ornamentation does not therefore occur among oriental manuscripts. The fashion of introducing pictorial art into the making of manuscripts was one which began at a very early period. There is a manuscript extant in which figures of human beings are used for illustration, which dates back to the early part of the 4th century. Varro, who lived in Rome in the 1st c. B.C., was the friend of Cæsar, and was directed by him to form a public library, is said by Pliny to have written a work of biography which he illustrated with many hundred portraits. A copy of *Dioscorides* in the imperial library at Vienna is illustrated with pictures of plants; and a 4th c. *Virgil* in the library of the Vatican is filled with decorative miniatures. A manuscript, which has been partly destroyed by fire, exists in the British museum library, which is still more remarkable in the way of illustration. It contained originally portions of both the Old and New Testament, and was ornamented with 250 miniatures, each of them 4 in. square, some of which remain in the partly destroyed fragment, the date of which is supposed to be about the 6th century. A copy of Homer's *Iliad* in the Ambrosian library in Milan, very ancient, is adorned with miniatures. Among the colors employed in writing in those early times were purple, green, blue, and vermilion, with gold and silver. The university of Upsala in Sweden has a splendid specimen known as the *Argenteus Codex* (see ULFILAS), which is written in letters of silver with initials of gold on violet-colored vellum. It was not until after the 4th c. that the initial letters were made larger than those in the body of the text; after that they increased in size until they were several inches in height, and sometimes even occupied an entire page. The Irish manuscripts of the 7th to the 10th c. displayed the most extraordinary forms of initials, being grotesque in character; objects from natural history were united by complicated patterns of interlaced work, the whole effect being unlike anything else in manuscript anywhere, and apparently original with the Irish illuminators, to whose work we shall return further on. The early Frank manuscripts show the influence of oriental styles, the illuminated initials being adorned with arabesques, combined with foliage patterns. The earliest Greek and Latin manuscripts were written without points or divisions, in square capital letters. Uncial writing was in use at the same time, and superseded the other style in about the 6th c.; it differed from the latter in being a combination of capitals and small letters, and led up to the *cursive* or flowing writing, which became customary by the 10th century. Abbreviations

were employed very early in the history of manuscripts, and by the 12th c. had become so general that manuscripts of that period are exceedingly difficult to read. Among such abbreviations, and tending to complicate still more the task of reading, are the arbitrary signs invented by Tiro, Cicero's freedman, for his system of short-hand. Punctuation was not known until the 10th c., when the comma first came into use, to be followed by exclamation and interrogation points, and the parenthesis five centuries later: about the 12th c. we first meet with the Arabic numerals in manuscripts.—First among the ancient manuscripts still in existence are the rolls of papyrus found in the tombs of Egypt, and which are frequently exhumed in a perfectly preserved condition—after having been buried for thousands of years—owing to the dry climate and the entire want of humidity in the sandy soil. Among these are both Egyptian and Greek manuscripts, the former being in hieroglyphic, hieratic, or demotic characters, and nearly always of a religious nature, and having special reference to the dead. One of these papyri, existing in the national library in Paris, is supposed to be of a period nearly four thousand years before Christ: it is a moral treatise, written by an Egyptian prince. There are also found many business documents, bills of sale, accounts, and letters, which are written in the demotic character. Of the Greek manuscripts on papyrus one of the oldest known to be in existence is of the 3d c. B.C., a portion of one of the books of the *Iliad;* another, found at Herculaneum, is part of a musical work by a writer of the 1st c. B.C., and is of that period. A petition to one of the Ptolemies, of the 2d c. B.C., exists in Paris. In the British museum there are rolls of parchment more than 3,000 years old, though the date of the invention of this material has been ascribed to the 2d c. B.C. The oldest parchment manuscript of a date since the beginning of the Christian era, is supposed to be the palimpsest (q.v.) of Cicero's *De Republica*, attributed to the 2d c., and now in the Vatican library at Rome. There are also in that library a copy of *Terence* of the 4th or 5th c., and a *Sallust* of about the same period. The celebrated Medicean *Virgil*, nearly perfect, is in Florence, in the Laurentian library; it is also of the 4th or 5th century.—The oldest manuscript of the Bible known to be in existence is the *Codex Sinaïticus*, found by Tischendorf in a convent on Mt. Sinai, and placed in the imperial library of St. Petersburg; it is believed to be of the 4th century. The *Codex Vaticanus*, a Greek manuscript of the Bible, is of about the same period with the last, though this is not so well authenticated. The *Codex Alexandrinus*, in the British museum, is of the middle of the 5th c.; and the *Codex Bezæ*, in the library of the university of Cambridge, Eng., of the 6th century.—Returning to the subject of ornamentation in this connection, and reverting to the labors of the Irish illuminators, we may properly quote from an English authority in regard to the importance and value of this class of manuscripts: "To the remotest of these nations the praise is due of having invented and developed an independent school of ornamentation, and one destined to become a formidable rival to the traditionary splendors of eastern art. In Ireland, as far back as the 5th c., a style of art had been practiced, which in the succeeding centuries attained a perfection almost incredible. In nearly complete isolation from the rest of the civilized world, having few opportunities of seeing and admiring the works of the great Greek artists, their method of ornamentation exhibits no artistic power in the higher sense of the word, but is remarkable for a fine harmony of color, and a precision of technical execution little short of miraculous. The principal features of the style are an intricate and tortuous interlacing of narrow threads or ribands, generally in symmetrical patterns, sometimes filling up a letter, sometimes extending over a whole page; now the introduction of a number of circular ornaments, now filled by marvelously delicate spiral lines proceeding from the center, now by bolder wheel-like patterns of endless variety of design; to these may be added the use of numbers of birds and animals coiled up in endless and seemingly inextricable confusion, sometimes varied by the introduction of the human figure, and patterns formed of diagonal and straight lines, generally in squares or compartments, the idea of which some writers assert to have sprung from the remembrance of tesselated pavements." A copy of the gospels, called the *Book of Kells*, of the 7th c., is a manuscript of this style in the library of Trinity college, Dublin. This peculiar method of design was early introduced into England by Irish missionaries, and a splendid specimen of its adaptation is preserved in the celebrated *Durham Book*, in the British museum, which was executed at Lindisfarne at the commencement of the 8th century. In this may be traced at once a stronger influence of the Byzantine types; and though it is a most superb specimen of writing and decoration it does not exhibit the same originality or fertility of imagination as the works of the Irish school. From England the new style passed quickly to the continent, and was soon adopted and largely used by the illuminators, and it is curious to notice in the manuscripts of the succeeding centuries, prolific in works of splendor and elegance, the admixture of the Celtic ornament with the remains of classic design. A change of style was introduced by the illuminators of England of the 10th century. This consisted in the introduction of foliage. At first it was of an entirely rudimentary character, and exhibited none of the botanical skill or study of nature so closely observed in later times. It was, in fact, a reflection of the architectural styles then becoming dominant, the ornaments and moldings of the great architectural works of the time being now adapted to the processes of book ornamentation. A magnificent specimen of this new style still exists in the *Benedictional* of St. Ethelwold, in the possession of the family of the duke of Devonshire. This manuscript

was executed at Winchester (the great school of the arts in England) at the close of the 10th century. In the succeeding century the style became more developed, the forms of the leaves more freely drawn and less archaic, but in the 12th c. conventionalism become the rule; ornamentation had grown to be luxuriant and fantastic; and the work produced was perhaps the most magnificent of any age. By the next century the tendency was towards naturalism, and men's minds were turned to a study of living forms, with the result of a wonderful advance in the character of the work. The initial letters of manuscripts of this period became glorious in burnished gold, scarlet, and blue. In the miniatures of manuscripts gold backgrounds were constantly employed, more especially in those of French artists. In the 14th c. the gold and plain backgrounds gave way to rich patterns of diaper and checker work, and the heavy mass of burnished gold was divided into minute patterns or was entirely superseded by variegated color. In the 15th c. floral decoration became common; and the introduction of a background of pure landscape in the miniatures is a feature of this period.—Throughout the whole of the dark and middle ages the value attached to the possession of manuscripts, and the activity shown in multiplying them, are very remarkable. Long previous to the 12th c. the most active zeal was displayed in search after ancient texts, even of profane authors. "In the middle of the 9th c. Lupus, abbot of Ferrières, earnestly requested from the pope and the bishops of England and Ireland the loan of manuscripts of ancient writers, that copies might be made of them; and in 1040 count Geoffroy of Anjou gave to the abbey of Notre Dame of Saintes the tithe of the hides of the deer killed in his forests to furnish a fund to bind the books of the monastery" (Silvestre). The same writer mentions also the veneration paid in the 15th c. to the Florentine *Pandects* of the Laurentian library, a magnificent volume written in the 7th c., and esteemed the most valuable of the manuscripts of the Roman law. This manuscript was taken from Pisa by the Florentines in 1406, and after its deposition at Florence "was regarded with almost religious veneration, being shown only to the highest personages, with great ceremony, in the presence of the chief magistrate, accompanied by monks, bareheaded, and bearing lighted tapers." The price of manuscripts in the middle ages offers some interesting points for reflection. There is one account of a contract made in 1346 for writing a volume containing psalter, hymnal, and collectary, ornamented with illuminated letters in gold, azure, and vermilion, for which the charge was 16 shillings. A 14th c. Bible captured at the battle of Poictiers, sold for 100 marks, at that time a sum representing about $1500. There is a manuscript in the British museum, which was pawned by its possessor five successive times between 1483 and 1510, a fact showing how readily money could be raised at that period on this species of property: in 1488 it was pawned for 28 shillings, and in 1510 for 20 shillings. Sometimes sums of money were deposited by borrowers of manuscripts as security for their safe return.

MANUSCRIPTS, ILLUMINATION OF, the art of painting manuscripts with miniatures and ornaments, an art of the most remote antiquity. The Egyptian papyri of the ritualistic class, as old as the 18th dynasty, are ornamented with vignettes or miniatures, attached to the chapters, either designed in black outlines, or painted in primary colors *in tempera*. Except these papyri, no other manuscripts of antiquity were, strictly speaking, illuminated; such Greek and Roman ones of the 1st c. as have reached the present day being written only. Pliny, indeed, mentions from Varro that authors had their portraits painted on their works, and mentions a biographical work, with numerous portraits introduced, but all such have disappeared in the wreck of ages; the oldest illuminated MSS. which have survived being the *Dioscorides* of Vienna, and the *Virgil* of the Vatican, both of the 4th c., and ornamented with vignettes or pictures in a Byzantine style of art. St. Jerome, indeed, in the same century, complains of the abuse of the practice, as shown by filling up books with capital letters of preposterous size; but the manuscripts of this and the subsequent century are ornamented with rubrics only, as evidenced by the *Codex Alexandrinus* and other manuscripts. Probably the art of illumination was derived from rubrics, as the emperors in the 5th c., commencing with Leo (470 A.D.), signed in this color, like the Chinese; and this "vermilion reply," adopted by Charles the bold in the 9th, continued down to the 13th century. The art of illuminating manuscripts with gold and silver letters is supposed to have been derived from Egypt, but it is remarkable that no papyrus has any gold or silver introduced into it. The artists who painted in gold, called *chrysographi*, are mentioned as early as the 2d century. One of the oldest manuscripts of this style is the *Codex Argenteus* of Ulphilas (360 A.D.); and the charter of king Edgar (966 A.D.), six centuries later, shows the use of these letters. Gold letters seem to have been used in the east during the 12th and 13th centuries. At an early period, the use of illuminated or decorated initial letters commenced, which is to be distinguished from the illuminated or painted pages placed at the head of Byzantine manuscripts. Originally, they were not larger than the text, or more colored; but the Syriac manuscripts of the 7th c. have them with a pattern or border; and they go on increasing in size and splendor from the 8th to the 11th c., when large initial letters, sometimes decorated with little pictures or miniatures, came into fashion in the Greek and Latin manuscripts. The subjects of the figures mixed up with the Arabesque ornaments often referred to the texts; warriors and warlike groups of figures being introduced when the text referred to war; symbolical representations of hell, where the

chapters following treated on that region. These initial letters soon increased to a great size, being from 2 to 24 in. long; they were most used in the 8th and 9th centuries, but continued till the 12th c., and degenerated in the 16th to the last decadence of art—the grotesque. The art, which flourished in the eastern and western empires, passed over to Ireland, and there gave rise to a separate school or kind of illumination. This style, which consists in a regular series of interlaced ribbon ornaments, often terminating in the heads of gryphons and other animals, seems to have been derived from the later patterns of Byzantine art, seen on mosaics, mural paintings, and other objects. Some, indeed, have thought that they are of oriental origin. The so-called Durham book, in the British museum, of the 8th c., is a splendid example of the school which was established in Holy island by St. Aidan, and in Kent by St. Dunstan, before the end of the 6th century. A remarkable MS. of the 6th c. is the book of Kells (q.v.), at Dublin. The scriptorium of the monastery at Hyde, near Winchester, was celebrated at this period for its illuminations; and the celebrated St. Dunstan of Glastonbury applied in early youth his talents to this art. The minute size and number of interlacements of the *Book of Kells*, at Dublin, is quite wonderful; while the *Benedictional* of Chatsworth, executed by one Godemann of Hyde for Ethelwold, bishop of Winchester (1100 A.D.), exhibits a bold style of art and ornament. Separate schools prevailed in the 11th c., the Greek or Byzantine manuscripts of the period exhibiting a fine style of ornament derived from the Byzantine school; while the Latin manuscripts of the period are distinguished by the use of a light blue and green in titles and pictures. While, however, the ornaments of the Byzantine and Latin schools were of a more purely architectural character, and the Anglo-Hibernian, Saxon, and even Franco-Gallic manuscripts of Charlemagne and his successors exhibit a union of Roman and Gaulish treatment; a new kind of work arose in the 10th c. in England, called the Opus Anglicum, resembling more in character the ornaments of Gothic architecture, a remarkable specimen of which is seen in the gospels made for Knut or Canute. During the 12th c., there arose a new style, distinguished by the profusion of its ornamentation, intricate mode of illumination, and abundant use of gold and silver. The taste was false, but the art had become more special, blank spaces being left for the limners to fill in. In the 13th c., the art still more deteriorated in western Europe—long-tailed illuminated initial letters were introduced; the background was often of gold, on which the ornaments and subjects were colored in a style resembling oil-painting, from 1190 to 1230; manuals were then prepared to instruct the limner, and the art was formalized. The Gothic style of ornament of this age had superseded the Roman or Byzantine of previous centuries. In the 14th c., the art greatly improved; the border or ornament running all round the page was introduced, and the ornaments were interpolated and enriched with miniature pictures, even by celebrated artists, as Niccolo Pisano, Cimabue, Giotto, in Italy. Few volumes, however, were illuminated till after the reign of Edward I., when the art took a further development; grotesque figures were introduced, and are alluded to by writers of the period. In the 15th c., continuous borders and fine miniature pictures were in use, and toward the end of the century, celebrated works of this nature were produced by Giulio Clovio in Italy, and Lucas van Leyden in Flanders, the Van Eycks, and Memling or Hemlink; medallions of exquisite style and finish were inserted in the border. Of this age, the most beautiful known specimen is the *Book of Hours* of Anne of Brittany, wife of Louis XII., with borders of natural plants on a gold ground. The Italian art of the same age was symmetrical rather than picturesque and naturalistic, but on solid backgrounds; the ornaments, although resembling those of preceding centuries, are distinguished by the introduction of miniatures. In the 16th c., in the reign of Louis XIV., the art became extinct, ending with a style of painting called *camaïeu gris*, a kind of monochrome, in which the lights are white or gold, and shaded so as to emulate bas-reliefs. Among oriental nations, the Persians, Hindus, and Chinese have illuminated manuscripts of great beauty, none of which, however, can compete with those of the western nations in antiquity. For beauty of design, some of the Arab manuscripts are charming, but their antiquity does not reach beyond the 13th century. The Chinese Buddhists have also illuminated classics, or religious books of their sect, one of which, the *Diamond Book* as it is called, in the British museum, has a text splendidly printed in silver and gold letters on a blue ground; and the vignettes charmingly painted *in tempera*, on macerated leaves of the *ficus Indica*.

Humphrey, H. Noel, *Art of Illumination* (12mo, Lond. 1849); Shaw's *Illuminated Letters* (fol. 1828); Bradley, J. W., *Manual of Illumination* (12mo, Lond. 1860).

MANUTIUS, ALDUS (*Aldo*, a diminutive of *Theobaldo*, his baptismal name), a great printer and improver of the art of printing. His name, in its Italian form, is spelled in three different ways by himself or his descendants, viz., Manuzio, Manuzzi, and Manucci; while from his patron, Alberto Pio, lord of Carpi, he took also the name of Pio, and after the year 1503, always designates himself Aldo Pio Manutio Romano. He is often called Aldus *the Elder*. He was born at Bassiano, near Velletri, in the states of the church, in 1449, and established a printing-press at Venice in 1490 (though the first book bearing a date has 1494), from which many works were issued (see ALDINE EDITIONS). He died 1515.

MANUTIUS, or MANUZIO, ALDUS, or ALDO, the Younger, 1547–97; b. Venice; son of Paulus Manutius. He was remarkably precocious, publishing a collection of specimens from Latin and Italian literature when only 11 years of age; and a work on Latin orthography when 14. He was not, however, so successful in after-life as his boyhood promised. He succeeded to the printing business of the family, but was less qualified than his predecessors in the management to conduct it to advantage. He retired from the business in 1584, resigning it into the hands of one his employees; and during the remainder of his life was professor of belles-lettres in Bologna, Pisa, and Rome. He possessed considerable learning, and edited some of the classics for publication.

MANUTIUS, or MANUZIO, PAULUS, or PAOLO, the Younger, 1512–74; b. Venice; youngest son of Aldus Manutius; and, like his father, a printer and editor. He had the charge of the business of the family after the death of his uncle; and having surrounded himself with the available learning of the period and region, he devoted himself to the production of the Latin classics in valuable revised editions. On the foundation of the Venetian academy in 1558 he received the appointment of professor of eloquence and director of the academical press. In 1561 he went to Rome to superintend the printing of the works of the fathers. His impressions bear favorable comparison with those of his father; and besides being a man of mechanical knowledge, skill, and taste as to the prosecution of his art, he was a scholar of much erudition, and a critic of acumen. He translated into Latin the *Philippics* of Demosthenes; and published commentaries on the *Familiar Letters* of Cicero; and the *Orations;* as well as scholia on the oratorical and philosophical treatises of the same author. See ALDINE EDITIONS, *ante.*

MANZANA'RES, a t. in Spain, in New Castile, province of Ciudad Real, 98 m. s. of Madrid, situated in a vast plain 1882 ft. above the sea level; pop. 10,275. The high-road of Andalusia, which passes through it, forms its main street. The houses are well built, with open courts, which are covered in summer with awnings. It contains good schools, a hospital, and a parish church of modern Gothic architecture. The country around is flat, requiring irrigation to render the soil productive. The climate is healthy and delightful; productions are wheat, rye, anise, saffron, potatoes, wine, and oil. There are manufactures of linen, woolen cloths, soap, and brandy; and the town has a reputation for the manufacture of carriages, and for iron work.

MANZANILL'O, a t. on the s.e. coast of the island of Cuba. It has a good harbor and carries on a considerable export trade in sugar, tobacco, and timber. Pop. 5,643.

MANZONI, ALESSANDRO, one of the most admired of modern Italian novelists, was born at Milan in 1784, of noble parents, his father being count Manzoni, and his mother the gifted daughter of the great savan marquis Beccaria. From a youth, the literary predilections of Manzoni gave good promise of his after mental development. In 1806, at the age of 21, his essay on poetry, entitled *Versi Sciolti,* was inspired by the death of Carlo Imbonati, an intimate family friend; and in 1810 his sacred lyrics met with general admiration. Several tragedies, written with much spirit and originality, attracted notice not only in Italy, but in France and Germany; and foremost amid the warm admirers and favorable critics of Manzoni stood Goethe. The work, however, by which Manzoni attained to European fame is his historical novel, *I Promessi Sposi*—a Milanese story of the 17th c., translated into German, English, French, and other tongues—(3 vols. Milan, 1827), by which a new era may be said to have been created in the fictitious literature of his country. The tale abounds in interesting sketches of national and local Italian customs and modes of life, portrayed with unflagging spirit and humor, while various grave historical events are narrated with force and grandeur of style, especially the episode of the plague in Milan. Manzoni's ode to Napoleon (1823) is noble in thought and diction. The poet's later years were spent in strict and devout seclusion, the free tendency of his early opinions having been succeeded by a stringent conformity to the doctrines of Rome. A complete edition of Manzoni's works, in 5 vols., was published by Tommaseo in Florence (1828–1829). He died in 1873.

MAOR, the royal official who, in the early periods of Scottish history, was placed over crown or fiscal lands, and at an after-time became the thane. A similar official, the maer, existed in Wales.

MAORIS (pronounced *mou'ris,* a word meaning *indigenous*) is the name given to themselves by the inhabitants of New Zealand, and that by which they are now usually designated by ethnologists. The Maoris, in common with the natives generally of Polynesia, belong to the Malay race or family of mankind. Though calling themselves indigenous, the Maoris have a tradition that their ancestors migrated to the present seat of the nation from the island of Hawaiki about 500 years ago. They came in 7 canoes, which had outriggers, to prevent foundering, and were called amatiatia, being very different from those subsequently used by them, which were much simpler in construction, and named wakka. The first of these canoes that touched at New Zealand was named Arawa, and this brought over the first settlers from whom the Maoris are descended. If any faith is to be attached to this tradition, Hawaiki was, probably, the same as Hawaii, the principal of the Sandwich islands, distant about 4,000 m. n.e. of New Zealand. Some, however, suppose that it may have been Savaii, one of the

Samoan or Navigators' islands, a group not half that distance away. The tradition says nothing of any indigenous population found in New Zealand before the arrival of these immigrants. Many writers, however, incline to the belief that it was previously inhabited by a darker race, somewhat akin to the Papuas of New Guinea, sometimes called Negritos and Pelagian negroes. Supposing that the two races, in process of time, intermingled, this might account, in some measure, for the differences apparent between the Maoris and the Tahitians, Samoans, Sandwich islanders, and other natives of the Pacific. But whether of pure or mixed race, all testimony combines in representing the Maoris as a nation standing very high in the scale of humanity. The skin of the Maoris is in general of an olive-brown color, but there are some in whom the shade is much lighter, while in others it is darker. In stature they almost equal Englishmen, and have a powerful muscular development. They have well-shaped, intellectual heads, and their features, when not tattooed, might almost be taken for European. Few of them have beards or whiskers, it being an immemorial custom with them to pluck out the hair on the face with pipi shells. On the head, the majority have long black hair, with a slight wave in it; but with some it is of a reddish tinge, and some Maoris again have the hair slightly frizzled. Their eyes are large, their lips thick, and their teeth, unlike those of most savage nations, are large and irregular. The women are of less stature than the men in proportion, and are in other respects inferior to them, perhaps from their marrying too young, and having to perform too much of the drudgery of life. Some of the women, however, are represented as being delicately molded, with long eye-lashes, pleasing features, and a plaintive, pathetic voice, which makes them highly interesting. Both sexes used to practice tattooing, a custom which has been almost abandoned since the conversion of the Maoris to Christianity. It was a painful operation, performed with a hammer and saw-like chisel. The punctures were stained with vegetable dyes, and the patterns, which extended over the face, hips, thighs, etc., represented ornamental scrolls and figures, supposed to denote the rank of the individual wearing them. The women were but slightly tattooed, with a few lines on the lips, chin, and occasionally other parts of the body. The priests were the principal operators, and during the process, ancient songs were sung, to encourage, divert the attention, and increase the patience of the sufferers. This tattooing was supposed to make the Maori youth more terrible in the eyes of his enemies, and more acceptable in those of his mistress. Another remarkable custom among the Maoris was that of the *taboo*, by which the priest could make certain persons and things sacred and inviolate. This was partly a religious and partly a political ordinance, and was so much respected that even in war-time hostile tribes left unharmed all persons and things thus protected by the *taboo* of the opposite side. Cannibalism, a much more heinous and abominable custom, practiced so lately as within the last 45 years, was universally prevalent among the Maoris before their conversion to Christianity. The last instance of it occurred in the year 1843. "Now, however," says Dr. Scherzer (*Voyage of the Novara*), "any allusion to this revolting practice is very painful to the New Zealander, as reminding him of his former low position in the scale of nations. Every time that we endeavored to make any inquiry of the natives respecting this custom, they withdrew with an ashamed look. In like manner, dogs' flesh has ceased to be an article of food, ever since the introduction of pork by capt. Cook. Formerly, the native or Maori dog, which at present is very scarce, was eaten on certain occasions, while its blood played a somewhat conspicuous part in Maori pharmacy." Infanticide, which also prevailed largely among them in their days of heathenism, is now universally abolished, and the same is the case with slavery and polygamy. The Maoris generally marry very young, and instances are known of females among them becoming mothers even at the tender age of 11 years. Their marriages, however, are not very productive, 3 in a family being considered a good average, and many of these dying in their first year. It is difficult to account for this, seeing that the Maoris of the present day are not addicted to intemperance, like other half-civilized tribes. The wars of the Maoris were formerly carried on with spears and clubs of various kinds, manufactured from stone and wood. Their most remarkable weapon was a spear of nephrite, which descended among the principal chiefs from father to son, and was regarded as a kind of scepter, and even a sacred object. It was called *merimeri*, "the fire of the gods," and was sometimes used for scalping prisoners. There are other weapons of nephrite in use among the Maoris; they are much sought after, and very costly. The use of fire-arms is now, however, very general among the Maoris, and that they are adroit marksmen has been made but too apparent in their contests with English troops. The language of the Maoris, like the Polynesian languages generally, belongs to the Malay family. Its alphabet comprises only 14 letters, viz., A, E, H, I, K, M, N, O, P, R, T, U, W, and Ng. Seven tolerably distinct dialects are spoken among them. The language is represented as rich and sonorous, well adapted for poetical expression, especially of the lyric kind. The Maoris have an abundance of metrical proverbs, legends, and traditions, of which a collection has been made by sir George Grey. They are also passionately attached to music and song. More than five-sixths of the Maoris are now converted to Christianity. Of these, such as live within the English settlements are becoming gradually assimilated to our own colonists, for the most part wearing the European dress, etc., while those further removed are content with the blanket, which has come to supersede the native

cloth. They generally practice agriculture, but will not work very hard. They are good sailors and fishermen, and, indeed, more than a hundred coasting-vessels of a good size are now the property of natives. The Maoris, however, as a nation, although ready to imitate our manners and customs, are not quite content with our colonial rule, and have frequently raised the standard of revolt against Britain under their native chieftains. In 1861 hostilities commenced between the Maoris and the British, which terminated in favor of the latter the following year. In 1863 war broke out again, the Maoris having conspired to expel the British troops. In 1868 they massacred many of the settlers, and resisted, to desperation, the troops sent to quell them—a feat accomplished the following year. Pop. '68, only 38,540.

MAORMOR, the old equivalent of the earl in Scotland, an official similar to a maor (q.v.), but placed over a province instead of a thanage, an earldom or county instead of a barony, exercising the office of royal deputy or steward over the territory of which he had at a still earlier period been the independent lord, and probably retaining to himself the third part of the royal revenues and prerogatives. Prior to the introduction of feudalism, Scotland seems in theory to have been subdivided into maormordoms, each made up of the maormor's portion and the king's, in later language, the earldom and the regality, over both of which the maormor exercised his office, though the former was, in a special sense, his own. Practically, however, in certain of these districts the king retained both maormordom and regality in his own hands, and the maors held their thanages directly of the sovereign, without the intervention of a maormor. As the feudal system extended, the maormors were converted into earls, who were confined within the limits of their own districts, the earl of Fife alone retaining the privilege of exacting his rights over the whole province.

MAP (Lat. *mappa*, a towel). A map is a delineation, on a plane, of some portion of the surface of a sphere, celestial or terrestrial, on which the objects intended to be shown are traced, whether stars or towns, mountains, etc. Terrestrial maps are termed *geographical*, when they refer to the land; and *hydrographical* maps, or *charts*, when they delineate the shores of the sea. A perfect representation of a country, with all its parts in true proportions and relative positions, may be made on a globe; but, since the surface of the earth is spherical, it is not possible so to delineate any large portion of it on a plane as to retain these properties. Hence geographers resort to different methods of representation called projections (q.v.), which are of two kinds—either real perspectives from different points of view, or approximative developments. The five principal projections are—the orthographic, the stereographic, the globular, the conical, and the cylindrical, or Mercator's.

In the first of these, the flat surface on which the map is drawn is supposed to pass through the center of the earth, and according to the distance of the eye, the projection is either of the first, second, or third kind. In the *orthographic*, the eye is assumed to be at an infinite distance from the center of the earth, so that all rays of light proceeding from every point in its surface are parallel and perpendicular.

From the nature of this projection, it is evident that while the central parts of the hemisphere are almost accurately represented, towards the circumference the countries are crowded together and diminished in size. On this account it is of little use for geographical, though of considerable value for astronomical purposes. In the *stereographic*, the eye or point of projection is assumed to be placed on the surface of the sphere opposite the one to be delineated. If the globe were transparent, the eye would then see the opposite concave surface. Contrary to the orthographic, this method contracts the center of the map, and enlarges it towards the circumference. Owing to the unequal area of the divisions, and the difficulty of finding the true latitude and longitude of places, this projection is not much employed. In order to rectify the opposite effects of the two preceding, the globular projection, a modification of the two, is generally adopted. If we suppose the eye to be removed from the surface to a distance equal to the sine of 45° of the circumscribing circle, the projection is called globular. In other words, if the diameter of the sphere be 200 parts, it must be produced 70 of these parts in order to give the point of projection.

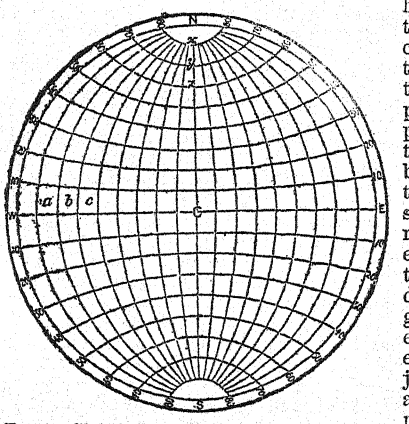


Fig. 1.—Globular, or Equidistant Projection of a Hemisphere.

All meridians and parallels in this projection are in reality elliptical curves, but as they approach so nearly to being circular arcs, they are very rarely shown otherwise.

The construction of the globular or equidistant projection is as follows (fig. 1): Describe a circle NESW, to represent a meridian, and draw two diameters, NCS and WCE,

perpendicular to each other, the one for a central meridian, the other for the equator. Then N and S will represent the north and south poles. Divide each of the quadrants into 9 equal parts, and each of the radii CN, CE, and C also into 9 equal parts. Produce NS both ways, and find on it the centers of circles which will pass through the three points 80 *x* 80, 70 *y* 70, etc., and these arcs described on both sides of the equator will be the parallels of latitude. In like manner, find on WE produced, the centers of circles which must pass through *a*, *b*, *c*, and the poles. Having selected the first meridian, number the others successively to the east and west of it. A map in this way may be constructed on the rational horizon of any place.

The impossibility of getting a perfect representation of special parts of the sphere by any of the previous methods, led to the desire for others less defective. Of all solid bodies whose surfaces can be accurately developed or rolled out upon a plane without alteration, the cone and cylinder approach nearest to the character of the sphere. A portion of the sphere between two parallels not far distant from each other, corresponds very exactly with a like conical zone; whence it is that conical developments make the best projections for special geographical maps, and even with some modifications for large portions of the globe.

A conical projection of Europe (fig. 2) is constructed thus: Draw a base line AB of indefinite length; bisect it in E, and at that point erect a perpendicular ED, to form the central meridian of the map. Take a space for 5° of latitude, and since Europe lies between the 35th and 75th parallels of latitude, mark off eight of these spaces along ED for the points through which the parallels must pass. The center from which to describe the parallels will be the point in ED where the top of a cone, cutting the globe at the 45th and 65th parallels, would meet the axis of the sphere. This point will be found to be beyond the north pole at C. Since on the parallels of 45° and 65°, where the cone

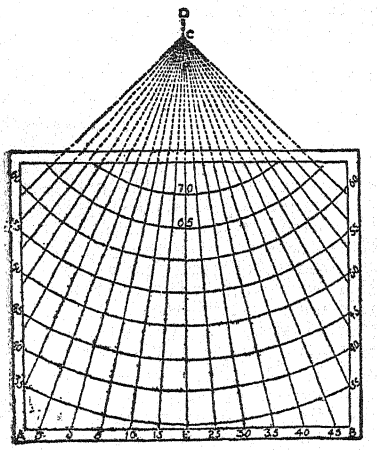

FIG. 2.—Conical Projection of Europe.

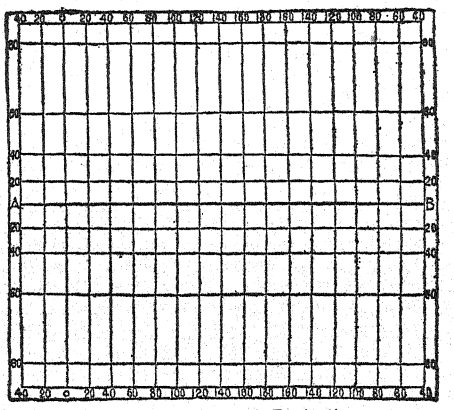

FIG. 3.—Mercator's Projection.

cuts the sphere, the degrees of longitude are exactly equal to those on the globe, if on these parallels distances be marked off equivalent to 5 degrees of longitude, in proportion to the degrees of latitude in those parallels, and through these points straight lines be drawn from C, they will represent the meridians for every 5 degrees.

Since all meridians on the globe are great circles passing through the poles, the north and south points at any place correspond with the poles of the earth. The east and west points, however, are indicated by a line at right angles to the meridian, and do not, except at the equator, correspond with those of the earth. In all the projections hitherto described, the direction either of the north and south, or of the east and west points, is represented by a curved line, so that on such a map the course of a vessel would almost always be laid down in a curve, which could only be described by continually laying off from the meridian a line at an angle equal to that made with the meridian by the point of the compass at which the ship was sailing. If the vessel were to steer in a direct n.e. course by one of the previous projections, she would, if land did not intervene, describe a spiral round, and ultimately arrive at the north pole: therefore, the mariner requires a chart which will enable him to steer his course by compass in straight lines only. This valuable instrument is supplied by Mercator's chart, in which all the meridians are straight lines *perpendicular* to the equator, and all the parallels straight lines *parallel* to the equator.

It is constructed as follows (fig. 3): A line AB is drawn of the required length for the equator. This line is divided into 36, 24, or 18 equal parts, for meridians at 10°, 15°, or 20° apart, and the meridians are then drawn through these perpendicular to AB. From a

table of meridional parts (a table of the number of minutes of a degree of longitude at the equator comprised between that and every parallel of latitude up to 89°), take the distances of the parallels and of the tropics and arctic circles from the equator, and mark them off to the north and south of it. Join these points, and the projection is made.

This projection, of course, does not and is not intended to give a natural representation of the earth, its effect being to exaggerate the polar regions immensely. The distortion in the form of countries and relative direction of places, is rectified by the degrees of latitude being made to increase proportionably to those of longitude. This is the only map which gives an unbroken view of the whole surface of the earth.

The term *map* is specially applied to representations of land, or land and water together; while that of *chart* is limited to the coast and water surface only, showing currents, rocks, anchorage, light-houses, harbors, soundings, and other objects of importance to seamen.

A geographical map proper is a general map of the world, or of a large extent of country. A topographical map differs from it in being limited in area, and much more detailed. The ordnance survey of Britain is a good example of a topographical map. Besides purely geographical and topographical maps, others are constructed for special purposes, which may be physical, political, or civil, military, statistical, historical, etc.

In order to construct a map, and to determine accurately the positions of places on it, a knowledge of two elements is essential—viz., latitude or distance from the equator, and longitude or distance east or west of the meridian adopted.

Every map, whatever its dimensions, is in some definite relation to the actual size of the globe. This relation is indicated by a scale—a graduated line showing, by its divisions, the number of miles corresponding to any space measured on the map. The scales of geographical maps range from about 800 m. to an inch (for maps of quarters of the globe) to 10 m. to an inch; those of topographical maps range from 1 in. to 25 in. to a mile, the largest topographical maps we have, admitting of the most minute details.

The ordnance survey of Great Britain is on the scale of $\frac{1}{63360}$ of nature, or 1 in. of paper to 1 m. of surface.

A recent improvement introduced into our best maps is that of printing the watercourses in blue ink, making the orography and skeleton of every country stand out in clear relief, thus avoiding the confusion resulting from all the lines being black, as in older maps.

MAPES, James J., ll.d., 1806–66; b. New York, where he was for a time a merchant and sugar-refiner, then professor of chemistry and natural philosophy in the national academy of design. He was the inventor of various useful processes in industrial chemistry. In later years he entered into the business of a scientific agriculturist near Newark, N. J., and was very successful. His knowledge of chemistry made him an expert in fertilizers, in which he was an extensive dealer. He was for a time editor of the *Working Farmer*, and published many papers and addresses on chemistry and agriculture. He also published the *American Repository of Arts*, etc., in 4 vols., the *Practical Farmer*, and other works. He spent considerable time in investigating the phenomena of spiritualism, with what conclusion is unknown. Died at Newark.

MAPES, or **MAP**, Walter, a famous mediæval writer of Latin verse, called by lord Lyttleton "the Anacreon of the 12th c.," was b. somewhere on the frontiers of Wales (probably Herefordshire) before 1150. He studied at Paris, and on his return to England found entrance to the court, became a favorite with Henry II., and was made archdeacon of Oxford in 1196, after which he does not again appear in history. He is thought to have died about 1210. Mapes's best known piece is the drinking-song, beginning

Meum est propositum in taberna mori,

which has been charmingly rendered into English by Leigh Hunt. It is part of a longer poem entitled *Confessio Golie*. Considerable doubt, however, is now felt as to the proper authorship of the poems commonly attributed to Mapes; and Mr. Wright, who has edited them for the Camden society (1841), brings forward several reasons for concluding that the author must be a different person from Mapes. The most weighty of these reasons is, that Giraldus Cambrensis, the intimate friend of the archdeacon, severely censures the poems that went under the name of Golias, of which the famous drinking-song was one, while in the same breath he warmly praises Mapes. It is certain, however, explain it as we may, that soon after the time of the archdeacon they were regarded as his, and his name is inscribed on them in MSS. of the 14th and 15th centuries. Mapes also wrote several prose works in Latin and Anglo-Norman.

MAPIMI, a desert in n. Mexico, extending s. from the Rio Grande 4½ degrees of latitude, and being about 2½° in width, or about 525 sq. miles. The name is taken from a mining town of about 5,000 pop. on the border of the desert. There is very little vegetation, but the presence of gold, silver, iron, and coal is claimed. Parts of Chihuahua, Durango, and Coahuila are included in the tract.

MAPLE, *Acer*, a genus of exogenous trees of the natural order *aceraceæ*. This order contains more than sixty species, natives of the temperate parts of the northern hemisphere, and particularly numerous in North America and the n. of India. They have

opposite leaves without stipules, usually lobed or palmate. The flowers are in axillary corymbs or racemes, small, but abounding in honey, and very attractive to bees. The calyx is generally divided into five segments; the petals, when present, equal in number to the segments of the calyx, grow from the margin of a fleshy, hypogynous disk. The fruit is formed of two small winged nuts, each with one or two seeds. With few exceptions, the genus *acer* includes the whole order.—The COMMON MAPLE (*A. campestre*), a small tree, is a native of Britain, and of many parts of Europe and Asia. The leaves are small, and usually five-lobed; the wood is compact, fine-grained, takes a high polish, and is much used by turners and for carved work. Several nearly allied species are found in the s. of Europe.—The STRIPED BARK MAPLE (*A. striatum*) of North America, where it often forms great part of the undergrowth in woods, is remarkable for longitudinal black and white stripes on its bark; and its wood, which is very white, is used for inlaying in cabinet-work.—The GREATER MAPLE or SYCAMORE (*A. pseudo-platanus*), commonly called *plane-tree* in Scotland, is a native of various parts of Europe, but a doubtful native of Britain, in which, however, it has long been common. It attains a height of 70 to 90 ft., has a spreading umbrageous head, and large, palmate, coarsely serrated leaves on long stalks. It is of quick growth, and succeeds well near the sea, and in other exposed situations. The wood is white, compact, and firm; not hard, but capable of a fine polish; and is used by wheelwrights, turners, etc. It is not apt to warp. Stair-rails are often made of it, and pattern-blocks for manufactories, as well as bowls, bread-plates, etc. Sugar is sometimes made from the sap of this tree, as from that of several other maples; but the species which yields it most abundantly is the SUGAR MAPLE (*A. saccharinum*) of North America, a species which much resembles the sycamore, and abounds in the northern parts of the United States and in the British possessions, where large quantities of sugar are made from it, although only for domestic use. The trunk of the sugar maple is generally more slender than that of the sycamore. To obtain sugar, holes are bored in the trunk when the sap is ascending, early in spring, before the winter frost has passed away, in an obliquely ascending direction, at no great distance from the ground, at first only to the depth of half an inch, but afterwards deepened to 2 in.; and the sap thus collected is evaporated in boilers over a brisk fire, to the consistency of syrup, strained and poured into molds, in which it crystallizes into a coarse gray or brown colored sugar. It is sometimes afterwards refined. Four gallons of sap yield about 1 lb. of sugar. A single tree yields from 2 to 6 lbs. in a season. During the sugar-making season, sheds are erected in the woods for the boiling and other processes of the manufacture. The sap cannot be kept long after being collected. Good vinegar is made from it, and a kind of molasses much superior to that from the sugar-cane, and much used in America with buckwheat cakes, etc. The wood of the sugar maple has a satiny appearance, and is used for cabinet-making; it is sometimes finely marked with undulations of fiber, and is then known as *bird's-eye maple*, and is used for veneers. The cultivation of the sugar maple in Europe, for the sake of its sugar, has of late been much advocated. It is not so hardy in the climate of Britain as the sycamore, and seems to require a dry and sheltered situation.—The NORWAY MAPLE (*A. platanoides*) is a native of the n. of Europe, although not of Britain, and is also found in North America. It much resembles the sycamore, and its wood is used for the same purposes. It is pretty common in plantations in Britain.—A Himalayan species (*A. villosum*), a noble tree, found with pines and birches of great elevations, has recently been introduced into Britain.

MAQUET, AUGUSTE, b. in Paris, 1813; educated at the college Charlemagne, where he was for a time teacher. Having written the drama entitled *Bathilde*, he was introduced to Alexandre Dumas to have it examined. The latter was struck with his talent, and proposed their working together. It is said that a considerable part of the romances which Dumas published previous to 1845 were largely from Maquet's pen. In 1851 he began publishing romances under his own name, which are highly appreciated in France. He has been president of the commission of dramatic authors and composers. His work in aid of Dumas embraced fifteen of his most famous novels. Under his own name since, are the romances *Histoire de la Bastille; Prisons de l'Europe; Belle Gabrielle;* and many others. For the theater he has prepared *La Fronde*, an opera; *Le Château de Gautier; Le Comte de Lavernie; La Belle Gabrielle;* and many others, in addition to the joint works of himself and Dumas, most of which he dramatized.

MAQUI, *Aristotelia maqui*, the only known species of a genus of plants sometimes referred to the natural order *tiliaceæ*, and which has also been made the type of a proposed order. It is an evergreen or sub-evergreen shrub, of considerable size, a native of Chili. The flowers are small, green, and yellow, in axillary racemes of no great beauty. The fruit is a three-celled berry, about the size of a pea, black, acid, and eatable; the Chilians make a wine from it. The wood is used for making musical instruments, and the tough bark for their strings. The maqui sometimes ripens fruit against a wall in England, and is frequently cultivated as an ornamental shrub.

MARA'BOU FEATHERS. See ADJUTANT.

MARABOU' STORK, the African name of the adjutant stork, pouched adjutant, or argala of India. The sausage-like pouch which hangs from its neck is capable of being inflated, giving the bird a strange appearance. It is gregarious in its wild state, fre-

quenting the mouths of rivers, and living upon animals too large for other storks to swallow. It is easily domesticated, but its exceeding voracity impels it on every occasion to purloin chickens, turkeys, legs of mutton, cats, puppies, etc., swallowing them whole. Land tortoises 10 in. long have been found in its maws. See ADJUTANT, *ante*.

MAR'ABUTS, a name given to the descendants of the *Moravides* (Arab. frontier inhabitants), a certain Arabic tribe, which, in 1075, founded a dynasty in the north-western parts of Africa, and held Morocco and Spain for a considerable period. The Almohads having put an end to their temporal dominion, their descendants exercise to this day a kind of spiritual superiority over the Moslem negroes in Barbary, the coast of Guinea, etc. They form a kind of priestly order, officiating at mosques and chapels, explaining the Koran, providing the faithful with amulets, prophesying, and working miracles. They are looked up to with great awe and reverence by the common populace, who also allow them a certain vague license over their goods and chattels—their wives not excluded. The great marabut ranks next to the king, and the dignity of a marabut is generally hereditary. One of the most eminent marabuts of our day was the late Abd-el-Kader (q.v.).

MARACAY'BO, a fortified city of the South American republic of Venezuela, is situated on a sandy plain on the w. shore of the strait which connects the lake of Maracaybo with the gulf of the same name. Lat. 10° 45′ n., long. 71° 40′ west. It is the chief town of the state of Zulia (formerly called Maracaybo), comprising the territory surrounding the lake of Maracaybo, and containing 33,075 sq.m., and a pop. of about 90,000. It is a handsome town, with a hot but healthy climate, and has a harbor deep enough to contain the largest vessels, but inaccessible to them, owing to the shifting bar at its mouth. The chief articles of export are cocoa, coffee, hides and skins, fustic, dividivi, the balsam of copaiba, and cotton. In 1871–72, 23,000,000 lbs. of coffee were exported. Pop. '73, 21,954.

MARACAYBO, LAKE and GULF. The lake of Maracaybo, in the n. of Venezuela, is about 100 m. in length and 70 m. in breadth. It is of considerable depth, but the bar at its mouth prohibits the entrance of large vessels. It is connected with the gulf of the same name by a strait upwards of 20 m. in length, and from 5 to 10 m. in breadth. The gulf is a wide inlet of the Caribbean sea, 150 m. from e. to w., and about 75 m. from n. to south.

MA'RAGHA, an old t. of Persia, in the province of Azerbijan, 50 m. s. of Tabriz, on a tributary of lake Urumiah. It is surrounded by walls, and was long the capital of the province. It contains two bridges of the 11th c., and the remains of the observatory of the celebrated mediæval astronomer, Nasir Eddin. Pop. 15,000.

MARAJO', an island on the n.e. coast of Brazil, belonging to the province of Para, and situated between the estuaries of the rivers Amazon and Para, is 180 m. in length by 125 m. in breadth. In the n.e. it is somewhat elevated, without trees, and covered by herds of cattle. The western portion is low, and watered by numerous streams. Pop. estimated at 20,000.

MARANHAM', or MARANHAO, a rich and important maritime province of the empire of Brazil, is bounded on the n. by the Atlantic ocean. Area, 141,939 sq.m.; pop. '72, 380,000. The surface is uneven, but there is no range of mountains. It is quadrilateral in shape, and is watered by numerous rivers, which, falling into the Atlantic, traverse its whole length in a direction parallel with its sides. Its climate is fine, and its soil produces vast quantities of rice, for the production of which it is peculiarly fitted. Cotton, sugar-cane, and fruits are also extensively grown. Its surface is still to a great extent covered with forests; iron and lead ores and antimony have been discovered; and sheep, cattle, and horses are extensively reared.—The chief city is Maranham, or San Luiz de Maranham, the fourth in rank and importance, and the best-built city in the Brazilian empire. It is situated on an island of the same name, in lat. 2° 30′ s., long. 44° 18′ w., is remarkably clean, gay, hospitable, and prosperous, and has a pop. of 36,000. Maranham is the seat of a bishop, contains a cathedral, 10 churches, several monasteries and convents, a lyceum, and other educational institutions.

MARAN'O, a t. of the province of Naples, situated on a gentle slope 4 m. from Naples. Pop. 7,302.

MARAÑON. See AMAZON, *ante*.

MARANS, a t. of France, department of Charente-Inférieure, near the union of the Sèvre-Niortaise and the Vendée, 13 m. n.e. of La Rochelle; pop. 3,217. It is well built, has a good bridge over the Sèvre, which is navigable here for vessels of 100 tons. By a canal recently constructed, ships of 300 tons can come to the town. The trade is principally in corn, wine, brandy, hemp, flax, timber, and salt. The surrounding country having been recovered from the sea, abounds in salt marshes, and is intersected by canals.

MARANTA'CEÆ, or CANNACEÆ, a natural order of endogenous plants, very nearly allied to *scitamineæ* (q.v.), and differing chiefly in having all the stamens petal-like, and the one fertile stamen lateral. They are destitute of the aromatic property so general in the *scitamineæ*. There are about 160 known species, all tropical or sub-tropical. They

are all herbaceous perennials. Not many of them are large or notable for the beauty of their flowers. The tuberous root-stocks of many abound in starch.

MARASCHINO. See LIQUEUR.

MARASH', a pashalic of Asiatic Turkey, is bounded n. by that of Sivas, e. by Diarbekis, s. by Aleppo, w. by Karamania. The greatest length is 130 m. and breadth 105 m.; pop. 248,000. It belongs to the basin of the Euphrates and the Jyhoon. The former river is the e. boundary, while the latter rises near its center and flows through it s.w. The district is mountainous and wooded except in the valleys of these rivers. It is crossed from w. to e. by the Taurus ridge and by the Anti-taurus and the Durdun Tagh. The climate is mild, and the country is well adapted to pasturage. The capital is Marash on the Jyhoon, 60 m. n.e. from the sea.

MARAS'MUS is a term which was somewhat vaguely used by the older medical writers to designate those cases of general emaciation or atrophy for which they did not see any special cause. The word is now seldom used except occasionally as a synonym for *tabes mesenterica*, or tubercular disease of the mesenteric glands. See MESENTERY, MESENTERIC DISEASE.

MARAT, JEAN PAUL, one of the most infamous characters of the French revolution, b. 1744, of Protestant parents, at Baudry, in Neufchâtel. He spent some of his early years in Britain; published several treatises in London; acted as a teacher of languages in Edinburgh; and underwent punishment for stealing some valuable medals from the museum in Oxford. Afterwards returning to Paris, he practiced an inferior branch of the medical profession until the revolution brought him into prominence as a demagogue. His features and appearance were grotesque, his look wild, and his speeches extravagant, the ludicrous mingling with the terrible. His influence over the lowest classes, however, soon became great. He issued a journal, which he at first called the *Publiciste Parisien*, but afterwards the *Ami du Peuple*, which is historically connected with some of the most fearful events of that period. No falsehood was too monstrous to be published in it, no atrocity too great to be recommended. It was in a great measure the influence of Marat which led to the cruelties and massacres of Sept., 1792, in the midst of which he was elected a member of the convention, but on his appearance there he was received with almost universal expressions of abhorrence. No one would sit beside him, and when he attempted to speak a tumult always arose. His journal, now the *Journal de la République*, became more ferocious and sanguinary than ever. He demanded the sacrifice of 270,000 heads, and defended this in the convention, saying that if these were not granted, he would demand more. During the king's trial, he was urgent for his immediate execution, and in his journal called upon the people to slay 200,000 of the adherents of the old régime, and to reduce the convention to one-fourth. In April, 1793, Marat obtained the enactment of the fearful law against suspected persons, in virtue of which 400,000 were imprisoned. Robespierre, Danton, and Marat were now the triumvirate which ruled France. But on July 13, 1793, Marat was stabbed in his own house by Charlotte Corday (q.v.). This event was followed by some of the worst atrocities of the reign of terror; streams of blood flowing, as was said, to the manes of Marat, whose likeness, with gaping wounds, painted by David, was exhibited on an altar in the court of the Louvre, and then hung up in the convention; whilst it was decreed that his housekeeper, whom he had married "one fine day, in the presence of the sun," should be maintained at the expense of the state. A decree of Nov. 4, 1793, gave to Marat's remains the honors of the Pantheon; but they were cast out of it again on Nov. 8, 1795, and his picture was removed from its place in the convention.

MARATE'A, an Italian town of the province of Basilicata, situated on the slope of a mountain, in the midst of a lovely and salubrious country. Pop. 6,480.

MARATHON, anciently, a village on the e. coast of Attica, about 20 m. n.e. of Athens, now called Marathona, or, according to Leake, the present Vrana. It was situated in a plain of the same name, about 6 m. in length and 3 in breadth, with a background of mountains in the w., and a marsh both on the n. and s.; eastward, it reaches the sea. Byron's lines in the *Isles of Greece* correctly describe it:

> The mountains look on Marathon—
> And Marathon looks on the sea.

It is gloriously memorable as the scene of the grand defeat of the Persian hordes of Darius by the Greeks under Miltiades (490 B.C.).

MAR'ATHON (*ante*), was named from the hero Marathos, and known in Homer's time. Here legend relates that Eurystheus was overcome by the Heraclidæ and Iolaus, and here took place the contest of Theseus and the bull. When Pisistratus was driven from Athens to Eubœa, Marathon was the first place occupied by him on his return. On the day of the great battle the Persian forces were under the command of Datis and Artaphernes, while Miltiades had eleven generals under his orders. Ancient writers differ widely in their estimate of the numbers of the invading forces. Plato declares that there were 500,000 in all; Trogus Pompeius, 600,000, but Cornelius Nepos says that of the effective force, there were 100,000 foot soldiers, and 10,000 cavalry. This last estimate is probably near the truth, as it agrees closely with the statement of Herodotus

that the whole force was transported in 600 triremes, each carrying 200 men. All writers agree that the Greeks numbered about 10,000; so it is safe to say that they were outnumbered at least ten to one. They were materially assisted, however, by their slaves, who are not included in the 10,000. The result of the battle was due to the rigid discipline of the Greeks, in comparison with whom the Persians were but an unruly mob, and to the military genius of Miltiades. Of the 10 generals, 5 were opposed to giving battle, and the deciding vote of the polemarch was given at Miltiades's urgent persuasion. Each general in succession held the chief command for one day, and it was so arranged that the battle should take place on the day when Miltiades was in command. The Persians lost about 6,400 men; while of the Athenians only 192 fell. Among them, however, was the polemarch Callimachus, Stresbius, one of the generals, and several men of high rank. Remains of the weapons used in the contest are still to be found on the field. Two mounds or *tumuli* were erected in the center of the plain, one commemorating the valor of the Athenians who perished, and setting forth their names and rank on carved pillars, and the other raised for the Platæans and slaves. The remains of these tombs, and of the marble trophies erected, may still be seen.

MARATHON, a co. in n. Wisconsin, area, 5,520 sq.m.; pop. '80, 17,121; foreign, 6,451. It is drained by the Wisconsin river, and its tributaries, the Big Eau Claire, Big Eau Pleine, Little Eau Pleine, Clover, and others. The surface is level, and much of it is covered with a heavy growth of timber—ash, beech, birch, elm, maple, and pine. The principal crops are wheat and oats. The manufacture of pine lumber is extensively carried on. The Wisconsin Central, and Wisconsin Valley railroads pass through it. Co. seat, Wausau.

MARATTA, or MARATTI, CARLO, 1625–1713, a Roman from the Marches of Ancona; an enthusiastic disciple of the Raphael school; an admirable copyist, and one of the most conscientious and skillful of painters in restorations. It is to his unwearied industry that modern times are indebted for the degree of preservation that the grand frescos of the Vatican and the masterpieces of Raphael in the Farnese palace and elsewhere have exhibited. They had already, in his time, so altered as to threaten soon to be ruined. Maratta opposed the tendency to immense frescos, and dissuaded his pupils from works of unusual size. His forte lay in paintings where the Virgin Mary was the principal subject, and of this class nearly every gallery in Europe has his works. But he was author also of other pieces of great merit. His daughter Maria, married to Zappa, was both poet and painter.

MARAUDING (a word common, under orthographic variations, to most of the European languages, and, probably, of identical root with the verb "to mar") is irregular plunder or violence offered to the inhabitants of a country by the individuals of an army. In all armies where discipline is maintained, marauding is, at least professedly, punished by death; the provost-marshal having power to inflict that penalty summarily on all offenders taken in the act.

MARAVE'DI, an old Spanish coin, either of vellon, worth about two-sevenths of a farthing; or of silver, worth five-sevenths of a farthing.

MARBEAU, JEAN BAPTISTE FRANÇOIS; b. at Brives, in Corrèze, France 1798. After practicing and writing upon law for some years, he became interested in the unfortunate condition of certain classes around him; and in 1844, while engaged in making a report on the asylums in his neighborhood, he became greatly interested in the uncared-for children of mothers who are obliged to go out to work as soon as their children cease to nurse. He felt that there was a gap in benevolent asylums for children, and could not rest till he had done something to fill it. He opened the first *crèche*, or infant asylum, in France, and wrote a work entitled *Des Crèches*, which has been translated into several languages. The profits of its publication he gave to the infant asylums of his own neighborhood. From the beginning made by him the system has extended through France, the civilized countries of Europe, and to the United States. In 1871 there were 81 asylums for infant children in France alone. Marbeau's philanthropic works, besides *Des Crèches*, are: *Politiques des Intérêts, ou Essai sur des Moyens d'améliorer le Sort des Travailleurs* (Paris, 1834); *Étude sur l'Économie social* (1844); *Du Pauperisme en France et des Moyens d'y porter Remède, ou Principes d'Économie charitable* (1847); *De l'Indigence et des Secours* (1850).

MARBECK, JOHN, d. about 1585, was organist of Windsor in the reign of Henry VIII. and his successor. An association having been formed in 1544 in support of the Lutheran doctrines, Marbeck joined it. Among the members were a priest, a singing man of St. George's chapel, and a tradesman. They were arrested on a charge of heresy. Their papers were seized, and in Marbeck's handwriting were found notes on the Bible and a concordance in English. The special charge against him, it is said, was that he had copied an epistle of Calvin against the mass. They were all condemned to the stake, but Marbeck, on account of his musical talents, and through the interposition of Gardiner, bishop of Winchester, was pardoned, and restored to his place as organist. He lived to see the triumph of his principles, and to publish his work, *The Boke of Common Praier, noted.* A new edition was published by Robert Jones, of Ely cathedral, entitled *Marbeck's Book of Common Prayer, for voices in unison, arranged for modern use, with an ad.*

libitum organ bass accompanyment. He finished also his *Concordance.* A *Te Deum* of his, and a mass for five voices, are found in Smith's *Musica Antiqua*, now in the British museum. In 1574 was published *The Lyves of Holy Saincles, Prophets, Patriarchs, and others;* and afterwards, *The Holie Historie of King David, drawn into English meetre; A Ripping Up of the Pope's Fardel.*

MARBLE, in its strict and proper sense, is a rock crystallized in a saccharoidal manner, having the fracture of loaf-sugar, and composed of carbonate of lime, either almost pure when the color is white or combined with oxide of iron or other impurities which give various colors to it. But many other kinds of stone are popularly included under this title. Indeed, any limestone rock sufficiently compact to admit of a polish is called marble. It is only in this vague sense that the indurated amorphous rocks used in this country can receive this name. Such are the black, red, gray, and variegated limestones of the old red sandstone period, found in Devonshire, which are very beautiful from the numbers of exquisitely preserved corals which abound in them; the marbles of the carboniferous series from Flintshire, Derbyshire, and Yorkshire, so full of encrinites; the shell marbles from the oolite rocks at Rance, Stamford, and Yovil; and the dark Purbeck and Petworth marbles, beautifully "figured" with shells, from the wealden strata, which were so much used by the architects of the middle ages.

Saccharine or statuary marble is a white, fine-grained rock, resembling loaf-sugar in color and texture, working freely in every direction, not liable to splinter, and taking a fine polish. Of the marbles used by the ancients the most famous are: Parian marble, a finely granular and very durable stone, with a waxy appearance when polished. Some of the finest Grecian sculptures were formed of this marble, among others the famous Venus de Medici. The marble of Pentelicus was at one time preferred by the Greeks to Parian, because it was whiter and finer grained. The Parthenon was entirely built of it, and many famous statues still remain which were executed in this marble, but they are always more or less weathered, never retaining the beautiful finish of the Parian statues. The quarries at Carrara were known to the ancients, but they have been more extensively wrought for modern sculptors, who use this marble chiefly. It is a fine-grained, pure white marble, but is so often traversed by gray veins that it is difficult to get large blocks free from them. Of colored marbles, the best known are the rosso antico, a deep blood-red, sprinkled with minute white dots; verde antico, a clouded green produced by a mixture of white marble and green serpentine; giallo antico, a deep yellow, with black or yellow rings; and nero antico, a deep black marble.

The crystalline structure of marbles may be the original condition in which the rock was formed as a chemical deposition, in the same manner as some stalactites are crystalline, but there can be no doubt that they principally owe their structure to metamorphic action which has taken place subsequent to their deposition. This action having, at the same time, destroyed all trace of fossils, marbles were considered formerly as belonging to the primitive or metamorphic series of rocks; but, while they generally are members of one of the paleozoic formations, it is now known that some of the statuary marbles of Greece and Italy are secondary, and others even tertiary limestones.

MARBLE (*ante*). Unstratified statuary marble is white in consequence of the action to which it has been subjected during some stage of its metamorphism. It is well known that blue limestone when burned becomes white, and this discharge of color will take place even before the carbonic acid gas is expelled. Marbles may be nearly pure carbonate of lime, or they may contain a large proportion of carbonate of magnesia, in fact, may be matamorphic dolomites (q.v.). The finest statuary marble is worth from $15 to $20 per cubic foot. The Grecian and Italian marbles have been described in the preceding article. In the United States, good statuary marble has for several years been quarried at West Rutland, Vt., where a layer from 3 to 4 ft. thick is interstratified with 40 or 50 ft. of clouded marble. The finest of statuary marble is found at Pittsford, Vt., where there is a bed 20 ft. thick, from which blocks have been taken capable of taking a very fine finish, in some respects perhaps superior to Carrara, although not working with quite equal facility. Some specimens have a faintish flesh tint, scarcely perceptible, which gives a very fine effect to busts, which, as is well known, are always improved by age, when made of marble too glaringly white. The greater portion of the marble in all quarries is more or less clouded, and most of the ancient temples are built of this kind. The Vermont marbles are of the age of the Trenton limestone, forming a part of the *eolian limestone* of prof. Hitchcock, which in that locality is about 2,000 ft. thick. At West Rutland the quarry is from 40 to 60 ft. thick, at Sutherland Falls from 70 to 80, and at Pittsford 600 ft. thick. This marble belt extends n. and s. of Rutland co., through Vermont and Massachusetts, but it loses in quality in both directions. Towards the n. it is finer and harder, but less sound, and towards the s. it becomes coarser. Another belt of white marble extends along the flanks of the Alleghanies, through a part of Massachusetts, through New York and Maryland, and into Virginia beyond the Potomac river. This marble is a dolomite, and coarsely crystalline. It is quarried at various places in Westchester co., N. Y., and at Baltimore. At Canaan, Conn., and at Lee, Mass., and other places in New England, good building marble is quarried. Marble from Lee was used for the extension of the capitol at Washington. There are many varieties of colored marbles, and these are plain or

variegated. There are plain black, red, blue, gray, and yellow marbles. A jet black marble was used by the ancients. A kind found in Italian ruins is called *Nero antico*, and is now used for a ground-work for mosaics. Black marbles occur at Derbyshire, England, Kilkenny, Ireland, and at Shoreham, Vt. At Glenn's Falls, N. Y., there is a black limestone, which is used alternately with white marble for tiles, which goes under the name of black marble. The colored marbles were largely used by the Romans and Etruscans for interior decoration. A gray marble much used by the Romans in architecture was called *cipolino*, and had much the appearance of gray granite. The columns of the temple of Jupiter Serapis were constructed of this stone. There are many localities of variegated marbles in the United States. A mottled lilac, chocolate, and white, known as Tennessee marble, is regarded with favor for mantels, tables, etc. Another of red, brown, and white is quarried at Burlington, Vt., but it is rather difficult to work on account of the silica it contains.

The opening of a marble quarry is usually expensive and attended with risk, as it is impossible to determine the quality of the stone before many feet thickness of rock is removed. From 10 to 30 ft. usually has to be taken off before perfectly sound disintegrated marble is reached. After a sufficient area of surface has been prepared by the removal of the imperfect stone, channeling machines, which may be either percussion or diamond drills, are set to work, and rectangularly crossed channels are cut to a desired depth, say from 5 to 7 feet. One of the blocks, called the key block, is then broken off at the base by wedging and lifted out with a crane. This gives ready access to the others, which are then drilled as circumstances may require, broken off by wedging, and removed to a saw-mill, where they are squared or sawed into slabs.

MARBLE, MANTON, b. Worcester, Mass., 1835; graduated at the Rochester university in 1855, and made his entrance into journalism in Boston, where he was connected with the *Journal* and *Traveller*. He removed to New York in 1858, and was employed during the next two years on the editorial staff of the *Evening Post*. In 1860 he united with others in founding the *World*, of which he eventually became sole proprietor. Under his management this paper gained great influence as an organ of the democratic party, and a vigorous exponent of the principles of free trade. Early in 1876 he retired from the *World*, and was closely connected with the political movements consequent to the presidential election of that year, which was in dispute between Samuel J. Tilden and Rutherford B. Hayes.

MARBLEHEAD', a sea-port t. of Massachusetts, on Massachusetts bay, 16 m. n.e. of Boston. Its population was formerly devoted to the fisheries, but is now also largely engaged in manufacturing, chiefly boots and shoes. The town was settled by emigrants from the Channel islands. At the close of the revolutionary war there were 600 widows; and at the end of the war of 1812, 500 citizens of Marblehead were prisoners of war in England. Pop. '70, 7,703.

MARBLEHEAD (*ante*) is built upon an elevated and rocky peninsula, 4 m. in length, and 2 m. in width, projecting into Massachusetts bay. It was once a part of Salem, which it joins on the west. It is connected with Boston, Portland, etc., by a branch of the Eastern railroad. It has a deep and very convenient harbor, but the shipping interest, formerly large, has declined of late. It has two national banks, a savings bank, excellent schools, a newspaper, and well established and prosperous churches. Many of the quaint peculiarities of the first settlers from the Channel islands may still be observed in their descendants. The place presents many features of interest. It has always been distinguished for patriotism, furnishing 1000 men to the revolutionary army. In the war for the suppression of the rebellion it furnished 1440 men. A wide-spread fire destroyed a large part of its business section in 1877.

MARBLES, PLAYING, are little balls of marble or some other hard substance, used as playthings by children. They are manufactured in great quantities in Saxony for export to India, China, and the United States. A hard calcareous stone is used in Saxony. After this material has been broken into square blocks, about 150 of these blocks are thrown together into a mill. This mill is generally constructed of a stationary flat slab of stone, which has numerous concentric furrows upon its face. A block of oak of the same diameter, part of which rests upon the small stones, is made to revolve over this, while water flows upon the stone slab. The whole process requires but a quarter of an hour, and a single mill can manufacture 20,000 marbles a week. The mills at Oberstein, on the Nahe, in Germany, manufacture marbles and agates especially for the American market.

MARBOIS, BARBÉ. See BARBÉ-MARBOIS, *ante*.

MAR'BURG, an interesting old German t., in the Prussian province of Hesse-Nassau, on both banks of the river Lahn 50 m. n. of Frankfort-on-the-Main, and 49 m. s.w. of Cassel. Its situation is strikingly beautiful. It is placed chiefly on a hill, round which are built quaint old-fashioned houses, interspersed with buildings of a later date, and separated by terrace-gardens. The hill is crowned by the stately burg or castle, while at its base extends the lovely valley of the Lahn. Of the ecclesiastical edifices, the principal is the fine Gothic church of St. Elizabeth, begun 1255, completed 1283, having two towers 303 ft. in height. It was erected in honor of St. Elizabeth (q.v.), daughter of

Andreas II. of Hungary, and wife of Ludwig, landgraf of Hesse and Thuringia. From her, the ancestress of the Cassel and Darmstadt branches of the house of Hesse, is descended the present princess (Alexandra) of Wales. The castle of Marburg was built in 1065. In one of its halls, the conferences between the Wittenberg and Swiss reformers regarding the Lord's-supper took place. The university of Marburg was founded in 1527 by Philip the magnanimous, landgraf of Hesse, and soon became one of the most flourishing in Protestant Europe. Among its earliest students were the celebrated Patrick Hamilton, and William Tyndale, the translator of the English Bible. The university has four faculties—theology, jurisprudence, medicine, and arts; and comprises about forty professors, twenty lecturers, and from 300 to 400 students. It contains a library of 130,000 volumes. Extensive potteries and tanneries are in operation. Pop. '75, 9,658.

MARC ANTONIO. See RAIMONDI, *ante*.

MARCA'TO, in music, means in a strongly accentuated or marked manner.

MARCEAU, FRANÇOIS SÉVERIN DES GRAVIERS, 1769–96; a soldier and officer of the first French revolution, who joined the army as a private at the age of 16. In 1789 he participated actively in the capture of the Bastille; in 1792 was in the army of the Ardennes commanded by Lafayette. When the latter was forced to fly to avoid the guillotine of the Jacobins, Marceau persuaded the subordinate officers to remain, in a harangue closing with these words—"Our country, and not our generals, is to be defended." He continued to act faithfully in accordance with this sentiment. In 1793, at the age of 24, he was made gen. of division; and in all the campaigns—under Westermen in the Vendées, under Kleber and Jourdan—he maintained a character for chivalric courage and devotion to the republic that made his early death a grief to all France.

MARCELLI'NUS, SAINT, b. Rome, 3d c.; d. 304; elected pope, 295. But little is known of his life or administration. There is an account, said to be fabulous, of a synod held at Sinuessa, in 303 or 304, during the Diocletian persecution; and Marcellinus is said to have confessed before this synod that, at the instance of Diocletian, he had offered incense to Vesta and Isis. The synod is said to have deposed Marcellinus, who, with many members of the synod, was put to death by Diocletian. The story is denied by Augustine and Theodoret, and is now not credited by either the Roman Catholics or the Protestant controversialists. Dr. Döllinger, in his work *Fables Respecting Popes in the Middle Ages*, attempts to show that the story of the deposition of Marcellinus is a fabrication of later times. The Roman church commemorates Marcellinus April 24.

MARCEL'LO, BENEDETTO, 1686–1739; b. Italy; son of Agostino Marcello, a Venetian senator. He studied music under Gasparini and Lotti, and produced his first valuable composition in 1716, a serenata in honor of the birth of the eldest son of the emperor Charles VI. The work to which he owes his fame appeared in 8 vols., 1724–26, under the name of *Estro Poetico-Armonico Parafrasi sopra i 50 primi Salmi, Poesia di G. A. Grustiani, musica de B. Marcello, Patrizio Venezio*. The characteristics of his musical style are melody and simplicity, and a sound good taste.

MARCEL'LUS, the name of two popes, of whom the latter deserves special notice, as having, when cardinal Marcello Cervini, taken a very prominent part in the discussions of the council of Trent, over which he was appointed to preside as legate of Julius III. He is also remarkable from the minor but curious circumstance of his not complying with the ancient custom by which the pope, on his election, lays aside his baptismal name, and assumes a new one. Marcello Cervini retained on his elevation the name which he had previously borne. He was elected Mar. 9, 1555, and survived his elevation but 22 days.

MARCELLUS, M. CLAUDIUS, a famous Roman gen., of one of the most eminent plebeian families. He was consul for the first time in 222 B.C., and obtained a decisive victory over the Insubrians in Cisalpine Gaul, slaying with his own hand their king, Britomartus or Viridomarus, whose spoils he dedicated to Jupiter, and was honored with a triumph. This was the third and last occasion in Roman history on which *spolia opima* were offered to the gods. In the second Punic war, Marcellus fought as prætor, in 216 B.C., against Hannibal at Nola, in Campania; and the victory which he gained was the more important, as it showed that Hannibal was not invincible, and that the Romans had not been irreparably overthrown at Cannæ. In the course of two years he thrice repulsed the Carthaginian gen. at this place. Being consul again in 214 B.C., he was intrusted with the command of the war in Sicily. He took Leontini, massacring in cold blood 2,000 Roman deserters whom he found there, and then advanced against Syracuse, which he tried to storm. All his efforts were rendered unavailing by the skill of Archimedes (q.v.), and he was compelled to regularly blockade the city. Famine, pestilence, and ultimately treachery on the part of the Spanish auxiliaries of the Syracusans, enabled Marcellus to make himself master of the place (212 B.C.), after which the remainder of Sicily was soon brought under the dominion of the Romans. He was the first Roman gen. who adopted the practice (afterwards so common) of despoiling conquered cities of their works of art. In 210 B.C. he was again consul, and was again opposed to Hannibal, with whom he fought an indecisive battle at Numistro, in Lucania, and by whom he was defeated at Canusium, in Apulia, in 209 B.C., but on the day following retrieved the defeat. In 208 B.C. he was for the fifth time elected to the consulate, and assumed once

more the command of the Roman army against Hannibal. When out reconnoitering one day he fell into an ambuscade, and was slain. The Carthaginian gen. treated his remains with honor. It ought to be noticed that the accounts of Marcellus's life given by Livy, Plutarch, and others, are believed to be very much colored and distorted—as Polybius, one of the best and most trustworthy authorities on the Punic war, denies that he ever defeated Hannibal at all!

MARCH, the first month of the Roman year, and the third according to our present calendar, consists of 31 days. It was considered as the first month of the year in England until the change of style in 1752, and the legal year was reckoned from Mar. 25. The Anglo-Saxons called it *Hlyd monath*, stormy month, and *Hraed monath*, rugged month. There is an old proverb, still used by the English and Scotch rustics, which represents March as borrowing three days from April; and in *The Complaynt of Scotland* they are thus described:

> The first it shall be wind and weet;
> The next it shall be snaw and sleet;
> The third it shall be sic a freeze
> Shall gar the birds stick to the trees.

But it is disputed whether these "borrowed days" are the last three of March or the first three of April.

MARCH, a musical composition, chiefly for military bands, with wind instruments, intended to accompany the marching of troops. There are slow and quick marches, also marches peculiar to different countries.

MARCH, a market t. of Cambridgeshire, England, 29 m. n. from Cambridge, on both sides of the Old Nen, which is here navigable for boats, and on the East Anglian railway. There is a junction of five railways at March. There is a large square market-place in the center of the town, and a splendid court-house, in which the meetings of the Middle level drainage commissioners are held. Pop. '71, 5,854. In the neighborhood is *March wet fen*, a drained fen with an area of 3,600 acres, from which the water is pumped off by steam-engines.

MARCH, or MORA'WA, a river in Austria, rising in Moravia, flowing s.e., and then s.w., separating Hungary from Moravia, during a part of its course, and entering the Danube 8 m. w. of Presburg. It is navigable for 50 m. from the Danube.

MARCH, ALDEN, LL.D., 1795–1869; b. Mass.; studied medicine at Boston and at Brown university, where he received a degree in 1820. He practiced surgery for many years at Albany, N. Y. He was one of the founders of the city hospital and the medical college at Albany, professor of surgery in the latter, and president of the American medical association.

MARCH, AUSIAS, d. about 1462; a Valencian poet, the date of whose birth is unknown; a disciple but not an imitator of Petrarch, and among the first poets of the 15th century. His productions are remarkable for force and delicacy, as well as for loftiness of poetic conception. The early editions of his works, published in the 16th c., are now very rare; but a more complete edition, based upon them, was published at Barcelona in 1864.

MARCH, CHARLES W., 1815–64; b. Portsmouth, N. H.; graduated at Harvard college in 1837; practiced law in Portsmouth, and was a member of the legislature. Subsequently he removed to New York, and became a writer for the *Tribune* and the *Times*, and a correspondent of the *Boston Courier*. He was also for a time vice-consul at Cairo. He published *Daniel Webster and his Contemporaries, or Reminiscences of Congress; Sketches and Adventures in Madeira, Portugal, and the Andalusias of Spain.*

MARCH, FRANCIS ANDREW, LL.D., b. Mass., 1825; graduated at Amherst college in 1845, where he was tutor 1847–49; was admitted to the bar in New York in 1850; taught school at Fredericksburg, Va., 1852–55; appointed tutor in Lafayette college 1855; adjunct professor 1856, and in 1858 professor of the English language and comparative philology; received the degree of LL.D. from the college of New Jersey in 1870, and from Amherst in 1871; elected in 1873 president of the American philological association. His contributions to the transactions of that society and of the national educational association on philological subjects have been numerous. He has written also for the *Jahrbuch für Romanische und Englische Literatur* in Berlin. To the *Princeton Review* he has contributed articles on jurisprudence and psychology. He has published *A Method of Philological Study of the English Language; Parser and Analyzer for Beginners; Anglo-Saxon Grammar; An Introduction to Anglo-Saxon; Grammar, Reader*, etc. He has also edited a series of text-books of the Greek and Latin Christian writers, of which *Latin Hymns* and *Eusebius* have been issued. His rank among American philologists is very high.

MARCHAND, JOHN B., b. Penn., 1808; entered the U. S. navy in 1828; was made lieut. in 1840, commander in 1855, capt. in 1862, and commodore in 1866. He took part in the Seminole and Mexican wars, and in the war for the union, distinguishing himself in the latter at the battle of Mobile bay, Aug. 5, 1864, where he commanded the *Lackawanna*. He retired in 1870.

MARCHAN'TIA, a genus of *hepaticæ* (q.v.), the type of a sub-order distinguished by the spore-cases bursting irregularly, and the spores being mixed with elaters, by some botanists elevated into a distinct order. Several species are natives of Britain, some of which are very common in moist shady situations, covering rocks, earth, etc., with their spreading green lichen-like fronds.

MARCHE'NA, a t. of Spain, in the province of Seville, and 33 m. e.s.e. of the city of that name, in a district rich in corn and olives. In the vicinity are sulphur baths, to which many invalids resort. Pop. 11,600.

MARCHES, the boundaries between England and Scotland, also between England and Wales. See MARK.

MARCHES, in Scotch law, mean the boundaries of property. By an ancient Scotch statute, one proprietor can compel an adjoining proprietor to join him in erecting a mutual fence, or to bear half the expense thereof. No such power exists in England or in Ireland.

MARCHES, THE, a central division of the Italian kingdom, comprising the provinces of Ancona, Ascoli-Piceno, Mascerata, Pesaro, and Urbino; 3,751 sq.m.; pop. 915,419. The district is bounded on the e. by the Adriatic sea, and on the w. and n.w. by the Apennines. It is traversed by the rivers Potenza, Foglia, and one or two smaller streams. The name is derived from the Italian *marce*. The most important city is Ancona, a sea-port on the Adriatic, 132 m. n.e. of Rome, and of very ancient origin; pop. 45,741. Great part of the country is mountainous, but not unfertile. The chief articles of export are fruit, oil, nuts, grain, and wool. Pesaro, the capital of Pesaro and Urbino, n. of Ancona, pop. 20,000, is supposed to be of Pelasgian origin, and had a bishop as early as 251 A.D. It is a sea-port town, and has a very considerable commercial trade. The cathedrals of both Pesaro and Macerata are of great interest, and the whole district is noted for its public buildings, mosaics, and works of art. An account of the separate provinces will be found under the appropriate heads.

MARCHE'SI, POMPEO, 1790–1858; b. Italy; a sculptor, the pupil of Canova, and afterwards professor in the academy of fine arts. His masterpiece is "The Celebration of Good Friday," a marble group in the church of S. Carlo in Milan, and his other most noteworthy works are statues of the emperor Francis of Beccaria, and Bellini, and the Goethe statue in the public library of Frankfort.

MARCHING, one of the first necessities to distinguish a body of disciplined troops from a mere crowd of men, is a regular cadenced step, taken by every individual at the same time and with the same foot. The necessity of this for harmonious action is obvious. The ancient Roman legions had military music to beat time for their march. In the feudal ages, when infantry fell into disrepute, cadenced marching was unattended to, and seems only to have been thoroughly revived by marshal Saxe. The best music for a march is found to be some simple tune, such as can readily be performed by drums and fifes. The music, besides preserving the time, acts as a preventative of fatigue.

In the British service there are the slow march of 75 paces, each of 30 in., in a minute —only used on parade; the quick march, of 110 paces, in which all evolutions are performed; and the double-quick, of 150 running paces, with the knees raised high. This last cannot be sustained for any great distance, and is employed in a charge, or in suddenly occupying a hill or some commanding position, and in a few short internal movements of regiments.

Countermarching is an evolution by which a body of men change front, and at the same time retain the same men in the front rank. The movement being represented by "right face, quick march, left wheel, forward, halt, front, dress." On the same principle, a whole army will sometimes change front. If after the countermarch the order "rear-face" be given, the same front will be preserved, with the rear-rank in front, and what was previously the right now serving as the left. A rear-rank may also become a front-rank by merely countermarching round the end of the latter, which remains stationary.

MARCIANI'SI, a t. of the Italian province of Caserta (Terra di Lavoro), situated 13 m. n. of Naples, in a low unhealthy plain, in the midst of several lakes. Pop. '72, 9,499.

MARCION, the founder of the Marcionites, an extremely ascetic Gnostic sect, was the son of a bishop of Sinope in Pontus. In his earlier years he was a sailor or ship-master. Being excommunicated by his father, on account of his heretical opinions, he went to Rome about 140 A.D. He made several anxious efforts to obtain a reconciliation with the Catholic church, for he does not appear to have loved schism; but his restless, prying, theorizing intellect constantly led him into opinions and practices too hostile to those of his fellow-Christians to permit of their being passed over in silence. After his final excommunication, he associated himself with the Syrian Gnostic Cerdon, and founded a system, in some respects, quite antagonistic to Christianity. The gospel of Christ, according to him, consisted in free love of the good; the Mosaic system, with its motives of rewards and punishments, was mere legality; and there is as irreconcilable an opposition between the respective authors of the "Law" and the "Gospel," i.e., the Creator, on the one hand, and the God of the Christians, on the other, as there is between these two works. His system is but imperfectly known; and it is supposed to have assumed

either three or four aboriginal beings—Good, Evil, Creator, and Matter. See GNOSTICS. Respecting the outward form of worship practiced among his followers, little is known save that it had great similarity—as had their whole religious system—to that of the Manichæans (q.v.). Marcion entirely rejected the Old Testament; and of the New Testament all but a few epistles and the gospel of St. Luke, which had also to undergo certain changes from his hand. The first four chapters were omitted, and the fifth he began with the words: "In the 15th year of the reign of Tiberius Cæsar, God came to Capernaum, a city of Galilee, and spoke on the Sabbath." The Marcionites subsisted as a distinct party till the 6th c., and were diffused through Syria, Egypt, Palestine, etc. Tertullian and others wrote against them.

MARCOMAN'NI, an ancient German people who, in the time of Cæsar, lived along the banks of the Rhine, but afterwards, as appears from Tacitus and Strabo, settled in Bohemia, from which they expelled the Boii. Their king, Maroboduus, entered into an alliance with the tribes living around them to defend Germany against the Romans. The combined forces of the alliance numbered 70,000 men, and the emperor Tiberius signed a treaty with them in 6 A.D.; but the Marcomannic alliance was beaten 11 years later by the Cherusci and their allies, and in 19 the Gothic Catualda drove Maroboduus from the throne, and himself usurped the sovereignty. But he was soon overthrown, and the native dynasty established, under whose rule the Marcomanni extended their territory up to the Danube, till their encroachments alarmed the Romans, who attacked them in the time of Domitian. This war, which subsided for a time in the reigns of Trajan and Hadrian, broke out again under Marcus Aurelius, and was carried on with bitterness from 166 to 180, when it was ended by the peace of Commodus. The Marcomanni continued to make raids into the provinces of Noricum and Rhætia, and in 270 invaded Italy as far as Ancona. From this time they are little heard of; and their identity finally disappears among the followers of Attila.

MARCO POLO. See POLO, *ante*.

MARCOU, JULES, b. in Salins, France, 1824; educated in Paris. He was companion and pupil of Germain, Thurmain, and Agassiz in their studies in the Alps in 1844–46; and in the latter year published his *Recherches Géologique sur le Jura Salinois*. In 1847 he had charge of the classification paleontological of the museum. In 1849 he visited the United States and made geological explorations with Agassiz and others. In 1853–54 he was employed by the United States government in geological surveys in the Rocky mountains and California. In 1855 he became professor of geology at Zurich. In 1860 he returned to the United States to study fossiliferous formations. His works are numerous. Those on the geology of the Jura mountains were his first and last; while of treatises on the geology of the United States and Canada, and especially of the geologic peculiarities of the Rocky mountains and California, his are among the highest French authorities.

MARCUS THE HERESIARCH, a Gnostic philosopher of the 2d century. Neander thinks he was born in Palestine; Jerome, that he was an Egyptian. Irenæus and others of the fathers say that he was very licentious. Neander in his Church history has the following account of him: "Marcus set forth his system in a poem, in which he introduced the divine Æons discoursing in liturgical forms, and with gorgeous symbols of worship. After the fashion of the Jewish cabala, he discovered special mysteries in the numbers and positions of letters. The idea of a *logos tou ontos*, of a 'word' manifesting the hidden divine essence in the creation, was spread out by him into the most subtle details; the entire creation being in his view a continuous *utterance* of the ineffable."

MARCUS AURELIUS. See ANTONINUS, *ante*.

MARCY, MOUNT, one of the Adirondack mountains, in Keene, Essex co., N. Y., 5,467 ft. high. It was known to the Indians as *Tahawus*, the "cloud-divider."

MARCY, ERASTUS E., b. at Greenwich, Mass., Dec. 9, 1815; graduated at Amherst in 1837, and at the Jefferson medical college in Philadelphia in 1840. He began the practice of medicine as an allopathist, but after a few years adopted the homeopathic doctrines, and settled in New York, where he met with great success. He wrote extensively on medical and chemical subjects, edited for many years the *Homeopathic Journal;* published *The Theory and Practice of Medicine*, and *Homeopathy vs. Allopathy*, which were translated into foreign languages and republished in Europe. He also edited Hahnemann's *Lesser Writings*.

MARCY, RANDOLPH B., b. Mass., about 1811; graduated at West Point in 1832, and was appointed lieut. 2d infantry in 1837; served in the war with Mexico, and was promoted to a captaincy; upon the conclusion of that war, was successively engaged in explorations in the Red river country, in operations against the Seminoles, and in the Utah expedition of 1857–58; was appointed paymaster, with the rank of major, in 1859, and inspector-gen., with the rank of col., in 1861; was chief of staff to gen. McClellan (his son-in-law) in West Virginia, on the peninsula, and in Maryland; and was made brig.gen. of volunteers Sept. 23, 1861. He has published *Exploration of the Red River; The Prairie Traveler;* and *Personal Recollections*. His residence is on Orange mountain, N. J.

MARCY, WILLIAM LEARNED, 1786–1857; b. Southbridge, Mass. In 1808, after graduating from Brown university, he taught school for a short time, but soon entered upon the practice of law at Troy, N. Y. At the opening of the war of 1812 he entered the volunteer service as a lieut., and Oct. 22, 1812, led the attack upon St. Regis, a Canadian post, stormed the block-house, and captured the first flag and prisoners taken on land in the war. At the close of the war he returned to Troy, where he was for some time editor of the *Budget*, an anti-federalist daily paper. After filling several minor offices, he was made an associate-justice of the New York supreme court in 1829; in 1831 he was elected senator of the United States by the democratic party, but resigned the office upon being chosen governor of New York in 1832 This position he held for three terms, but in 1838 was defeated by William H. Seward. He was appointed a commissioner on Mexican claims in the same year, and served in that capacity until 1842. In 1845 he became the secretary of war in Polk's cabinet. His ability in this position was severely tested by the Mexican war, and it was generally acknowledged that in the conduct of that conflict he displayed much energy and diplomatic adroitness. The last and most important public station in which he served was that of secretary of state in Pierce's administration, 1853–57. Among the foreign complications or treaties which demanded his action in this capacity were the Oregon question, the acquisition of Arizona and settling of the Mexican boundary, the Canadian reciprocity treaty, commodore Perry's negotiations with Japan, the British fishery dispute, and the Ostend conference. In nearly all of these and other questions Marcy successfully defended the interests of his country; and in all he displayed the qualities of a trained statesman and accomplished diplomat. The most notable of his diplomatic correspondence was the series of letters in the case of Martin Koszta, a Hungarian, who, after declaring in New York his intention of becoming an American citizen, was detained by the Austrian power at Smyrna, and released by capt. Ingraham (q.v.) of the U. S. navy. Mr. Marcy's death occurred but a few months after the expiration of his term of office, at Ballston Spa, N. Y.

MARDI GRAS (literally fat Tuesday), the French designation for what is known as Shrove Tuesday in the calendar of the English church, the festival held upon the Tuesday preceding Ash Wednesday, the first day of Lent; with the exception of Mi-Carême or mid-Lent Thursday, the last of the prolonged festivities known as the carnival. It is most extensively celebrated in Rome and Paris. In the latter it has been the custom for many centuries to lead in procession a fat or prize ox (*bœuf gras*, whence *Mardi gras*), followed in a triumphal car by a child called the butchers' king. The entire day and night is spent in the wildest revelry, sometimes degenerating into unrestrained license. In the United States the only celebration of Mardi gras worthy of note is that of New Orleans, where the first display was given in 1857, and since the end of the war the observance has been carried out with great pomp and splendor. For the preceding week the gayety has been universal, and on Mardi gras the whole city is turned over to the rule of king Rex, who enters the gates on the previous day. On Tuesday the mimic monarch passes through the streets, escorted by his body-guard, the "mystic krewe of Comus," knights of Momus, and various military and visiting organizations. To him are confided the gates of the city; minor police regulations are suspended, and until the dawn of Ash Wednesday the air is filled with music; in every street are dense throngs of merry-makers, and the glare of illuminations. In the evening occurs the great street pageant of the mystic krewe of Comus, in which are displayed elaborate tableaux, placed on moving platforms and brilliantly illuminated. These represent noted scenes of history, poetry, or fiction, and are constructed at great expense and with artistic elegance. All the arrangements of the parades and accompanying balls are under the control of societies composed of the most noted professional and business men of the city. The observance is gaining ground also in Memphis, Tenn.

MARDIN', a considerable t. of Asiatic Turkey, is strikingly situated, at an elevation of 2,300 ft., on the southern slopes of the Mardin hills (anciently Mt. Masius), 57 m. s.e. of Diarbekir. It contains numerous mosques, bazaars, and baths, and the ruins of an old castle. The ornaments in arabesque on the gates of the citadel are said to be finer than those of the Alhambra. Pop. about 15,000, of whom the half are Moslem Kurds, and the other half Chaldeans, Maronites, and Jacobites (q.v.), and who carry on manufactures of linen and cotton fabrics, and of leather. During the decline of the caliphate of Bagdad, Mardin rose to considerable importance, and was for a long time the capital of a principality under a branch of the Ayubites (descendants of Salah-ed-din), but its short-lived glory was soon after quenched by the advancing tide of the Mongols. It was subsequently taken by Timur.

MAREE', LOCH. in the w. of Ross-shire, Scotland, is 18 m. in length, with a breadth varying from 1 to 3 m., and a depth, in some places, of 60 fathoms. Owing to its great depth, it never freezes over its whole extent. It is surrounded by mountain-scenery which, for wildness and grandeur, is not excelled in Scotland. Its waters are carried off to the sea by the river Ewe, 2 m. in length. The loch contains numerous islets, one of which contains the remains of an ancient chapel, with a grave-yard.

MARE ISLAND, in Solano co., Cal., off the bay of S. Pablo. It has a U. S. navy-yard, an arsenal, and a floating dock.

MAREM'MA (corrupted from Marittima, *situated on the sea*), a vast marshy region of w. Italy, extending along the sea-coast of Tuscany, from the mouth of the Cecina to Orbitello, and embracing an area of 997 sq. miles. The Pontine marshes and the Campagna of Rome are similar districts. Formerly, these maremme were fruitful and populous plains; but neglect of the water-courses of the district allowed the formation of marshes; and now they have become generators of tertiary fevers, and present an aspect of dreary desolation in the summer months, when the inhabitants flee from their miasmata, prejudicial alike to man and beast. Leopold II., the late grand duke of Tuscany, directed especial attention to the drainage and amelioration of the Tuscan maremme, and considerable success attended their being largely planted, trees being a corrective of their malarious effects. From 1828 to 1848 the cost of the drainage of the maremma was £531,000. The arable land in the vicinity of the maremma is exuberantly fertile; but the harvests are gathered by hired laborers in the most infected districts, and in their emaciated and livid features may be seen the fatal action of malaria. During winter the maremma is inhabitable, and yields good pasture.

MAREN'CO, CARLO, 1800–43; b. Piedmont; studied law at Turin, where he graduated in 1818. He soon turned his attention to literature, and won a considerable reputation in 1828 by a drama called *Bondelmonte*. His posthumous works were published at Florence in 1856, as *Tragedie Inedite*. His most popular work, perhaps, is *La Famiglia Foscari*.

MARENGO, a co. of w. Alabama, traversed by the Arkansas Midland railroad, and drained by the Tombigbee and Black Warrior rivers, the first forming the w. boundary; 975 sq.m.; pop. '70, 26,151—20,058 colored. The soil is extremely fertile, the staples being cotton, Indian corn, and sweet-potatoes; of cotton, 23,614 bales were raised in 1870; and of Indian corn, nearly 600,000 bushels. Butter is also a staple, and the county is well stocked with horses, cattle, and swine. Chief town, Linden.

MAREN'GO, a village of northern Italy, in the province of Alessandria, situated near the Bormida, in the midst of extensive forests. Marengo was the scene of a memorable battle, in which a French army, commanded by Bonaparte, and numbering somewhat more than 20,000, defeated and routed 32,000 Austrians, under gen. Melas, on June 14, 1800.

MARENHOLZ-BULOW (BERTHA VON BULOW), Baroness, for many years an advocate and expounder of the principles of the kindergartner system of education for young children. She was intimately acquainted with Frederick Froebel, the founder of the system, obtained a thorough knowledge of it from him, and introduced the schools in nearly all the countries of Europe, and in England. In Berlin she sustained a normal school for three years, where teachers of kindergartens were educated, and has since been lecturer in the Dresden college of the same kind. She has printed several pamphlets and lectures on the subject, such as *The Kindergarten* and *The Child and its Being*.

MAREO'TIS, or **MAREIA**, LAKE, the modern *Birket-el-Mariût*, a salt lake or marsh in the n. of Egypt, extends southward from the city of Alexandria, and is separated from the Mediterranean, on its n.w. side, by a narrow isthmus of sand. In ancient times its length was about 42 m., its breadth about 22. Its shores were planted with olives and vines, and the papyrus, which grew upon its banks and on its eight islets, was famous for its fine quality. In more recent times, the canals which fed lake Mareotis were neglected, and its depth and area were much reduced. In the 18th c. the bed had become, in great part, a sandy waste; but in 1801, during the war between the English and French, the sea was let in by the former, and it is now again a marshy lake. The passage by which the sea found entrance was subsequently closed up by Mehemed Ali. The present dimensions of the lake are about 27 m. long by 25 m. broad.

MARESCH, J. A., 1709–94; a Bohemian by birth; but the greater part of his life was spent in the Russian service. He was a musician and made great improvements in the construction of the Russian horn, an unbent brass tube of conical shape. In 1755 he gave an exhibition before the imperial court, when a band of 37 men, furnished with horns varying from 7 feet to 1 foot in length, produced concerted pieces, each being carefully drilled to sound his own instrument at precisely the proper instant. For the skill and dexterity displayed in this rather ludicrous performance Maresch was richly rewarded by the empress Elizabeth.

MARET, HENRI LOUIS CHARLES, b. France, 1804. As a priest of the seminary of Sulpice, Paris, he distinguished himself in 1869 by joining a group of French bishops and theologians who pronounced squarely against the dogma of the infallibility of the pope, then just proclaimed officially from Rome. He wrote *Du Concile général*, a book which showed the absurdity of the claim from a standpoint within the church. This brought down upon him the anathemas of the pope's party and its organs, though the archbishops of Paris, Orleans, and Bésançon were quite of the same opinion as Maret. But in 1871 Maret made a complete surrender, and declared to the pope that he "regretted everything which he had said in that work." He has been a large contributor to Roman Catholic reviews since 1836. His works on the relations of religion and philosophy are numerous.

MARET, HUGUES BERNARD. See BASSANO, *ante*.

MAREY, ÉTIENNE JULES, b. at Beaune, France, 1830; educated as a physician. In 1850 he went to Paris; in 1860 opened a school of experimental physiology and gave a free course of instruction the following year on the circulation of the blood and the diagnosis of the diseases of the heart and its vessels. In 1864 he founded a laboratory of physiology in the *rue de l'Ancienne Comédie* in Paris; in 1867 succeeded Flourens as assistant professor of natural history in the college of France; and subsequently has filled many positions of honor in Paris and elsewhere. The study of animal heat, of muscular and nervous action in connection with the movements of the heart, electrical phenomena, and the study of the effects of various poisons have been his specialties. His works are mostly contributions to medical magazines and reviews, and he has published the following volumes: *Recherches sur la Circulation du Sang à l'état sain et dans les Maladies*, 1859, 4to; *Physiologie Medicale de la Circulation du Sang*, 1863, 8vo; *Études Physiologiques sur les Caractéri e graphique des Battement du Cœur, et des Mouvements Respiratoires*, 1865, 8vo; *Du Mouvement dans les Fonctions de la Vie*, 1867, 8vo; etc.

MARFO'RI, CARLOS, b. Italy, 1820; entered the Spanish civil service, and became a favorite of queen Isabella. He was an intimate friend of Narvaez, who originally introduced him to favor, and when Narvaez took office in 1866, Marfori became governor of Madrid and chief of the royal household. He was an object of hatred to the people, but remained in high favor with the queen, who refused to dismiss him, and, since the revolution by which she lost the crown, he has continued to be the chief of her household.

MARGARET, sometimes called the "Northern Semiramis," queen of the triple Scandinavian kingdom of Denmark, Norway, and Sweden, was the second daughter of Valdemar III., king of Denmark, and wife of Hakon VIII., king of Norway. Margaret was born in 1353, and on the death of her father, without direct male heirs, in 1375, the Danish nobles, passing over the son of Valdemar's eldest daughter, Ingeborg of Mecklenburg, offered the crown to Margaret and her husband in trust for their infant son Olaf. By the death of Hakon in 1380, Margaret became sole guardian of the young prince, who died at the age of 17 in 1387; and such was the discretion with which she had conducted the government during her sole regency, that the estates of both kingdoms concurred in electing her as their joint sovereign ruler. Having received the crown at their hands, she convoked a *landthing*, in which she announced that, with the concurrence of her subjects, she would nominate her grand-nephew, Eric of Pomerania, as her successor; and although, owing to Eric's infancy at the time, and his subsequent incapacity, the real power rested in the hands of Margaret, she contented herself from that time with the title of "Margaret, by the grace of God, daughter of Valdemar, king of Denmark." At the moment that Margaret was cementing the union of Norway and Denmark, the condition of affairs in Sweden opened the way for a further extension of her power; for the Swedish king, Albert of Mecklenburg, had so thoroughly alienated the affections of his subjects, that the nobles, declaring the throne vacant, offered to acknowledge Margaret as their ruler. The queen lost no time in sending an army into Sweden to support her pretensions, and defeated the king's German troops at Leaby, where Albert and his son Eric fell into her hands. Albert remained in prison seven years, during which time Margaret succeeded in wholly subjugating Sweden; and in 1397 she made her triumphal entry into Stockholm, with her nephew Eric, who shortly afterwards was, in his 16th year, crowned king of the three Scandinavian kingdoms. On this occasion, Margaret brought forward the memorable act of union, which she had drawn up with her own hand, and to which were appended the signatures of seventeen of the principal men in the three kingdoms. By this remarkable act, known as the union of Calmar, from the place at which it was signed and first promulgated, it was stipulated that the three kingdoms should remain forever at peace under one king, retaining their own laws and customs; and that, at the death of the sovereign, if he left several sons, one of their number should be chosen by the combined estates of the three realms, who were also to elect a new king in the event of the deceased monarch having died childless. This utopian scheme utterly broke down at the death of Margaret, which took place in 1412.

MARGARET (MARIE MARGUERITE THÉRÈSE JEANNE DE SAVOIE), queen of Italy, b. 1851; daughter of Ferdinand, prince of Savoy; was married April 22, 1868, to Humbert, hereditary prince of Savoy, prince royal, and prince of Piedmont. The latter succeeded his father, Victor Emmanuel I., as king of Italy, Jan. 9, 1878, and Margaret ascended the throne with him as queen of Italy. She is amiable, cultivated, and the idol of her people. With a cultured taste and exquisite tact, she has a rare sweetness of disposition, and is almost idolized by the Italian people.

MARGARET OF ANGOULÊME. See MARGUERITE DE VALOIS, *ante*.

MARGARET OF ANJOU, wife of Henry VI. of England, and daughter of René of Anjou, the titular king of Sicily, and of Isabella of Lorraine, was b. at Pont-à-Mousson, in Lorraine, Mar., 1425. She was married to Henry VI. of England in 1445; and her husband being a person of very weak character, she exercised an almost unlimited authority over him, and was the virtual sovereign of the realm; but a secret contract at her marriage, by which Maine and Anjou were relinquished to the French, excited

great dissatisfaction in England. The strife between the English and French, which lost to the former the whole of their possessions in France except Calais, was charged upon Margaret. In 1450 occurred the insurrection of Jack Cade, and soon after the country was plunged in the horrors of that bloody civil war known as the *Wars of the Roses* (q.v.). After a struggle of nearly 20 years, Margaret was defeated and taken prisoner at Tewkesbury, and imprisoned in the Tower, where she remained five years, till Louis XI. redeemed her for 50,000 crowns. She then retired to France, and died at the château of Dampierre, near Saumur, in Anjou, Aug. 25, 1482.

MARGARET OF AUSTRIA, 1440–1530; b. in Brussels; daughter of Maximilian I., emperor of Austria, and of Mary of Burgundy; remarkable for her domestic misfortunes, and her wisdom as ruler and in diplomacy. While an infant she was by the treaty of Arras affianced to the dauphin of France, afterwards Charles VIII., but the contract was not filled. In 1495, by a treaty with Ferdinand and Isabella of Spain, she was again engaged to prince John of the Asturias, heir to the Spanish throne. On her way to Spain to marry him, in the midst of a storm at sea, supposing they would be wrecked, she had the amiable pleasantry to write her own epitaph in these words:

Ci-git Margot, la gente demoiselle,
Qu'eut deux maris, et si morut pucelle.

But she married prince John nevertheless in 1497. He died the same year and she returned in 1499 to the Netherlands. In 1501 she married Philibert, duke of Savoy, who died without issue in 1504, after a happy married life with her. On the death of her brother Philip in 1506 her father the emperor made her regent of the Netherlands, and gave her charge of the education of her nephew, the future Charles V. of Germany, and his sister Mary. She assumed the government, exhibited administrative talent of a high order; assisted as plenipotentiary in the conference of Cambrai in 1508, and concluded the treaty with cardinal Amboise; brought the king of England to league against France in 1515; and negotiated with Louise of Savoy the peace of 1529, called the *Paix des Dames*. These were but the more showy events of her government. Her real title to most honorable mention in history is derived from the wisdom of the peaceful measures of her government, which brought the agriculture, the commerce, and the arts of the Netherlands to a high degree of prosperity. Margaret was the author of numerous unpublished poetical effusions. Her *Correspondence avec son Pere* was published in Paris in 1839 in two 8vo volumes.

MARGARET OF AUSTRIA, Duchess of Parma, Regent of the Netherlands; 1522–86; b. in Brussels; daughter of Charles V. without marriage by Marguerite van Gest of the Netherlands. In 1535 she married Alexander, duke of Florence, who died in 1537; and in 1538 married Octave Farnese, who became duke of Parma and of Plaisance. She was appointed by Philip II. in 1559 to govern the Netherlands, and followed the system of her great predecessor of the same name in softening the asperities of conflicting parties in the government, and moderating the execution of the terrible religious edicts of Philip II. The latter refusing to modify his persecutions under the inquisition, an insurrection broke out in 1566. While she manifested great energy in repressing it, she did all in her power to prevent the cruelties of Spanish religious intolerance towards those who took part in it. But no sooner was order re-established than Philip II. sent the duke of Alva with full power to complete the work in the spirit of the inquisition, and placed in his hands the powers with which she had been invested. She left the country to become the butchering-ground of religious persecution, and rejoined her husband in Italy, where she passed the remainder of her life. She was of masculine temperament, loved the chase, was a natural politician, gifted with a supple sagacity that suited itself to the occasion, and with views of statesmanship several centuries in advance of those of Spanish rulers.

MARGARET, SAINT, Queen of Malcolm Canmore (q.v.).

MARGA'RIC ACID ($C_{34}H_{33}O_3$. HO) is one of the solid fatty acids. At an ordinary temperature it is solid, white, and crystalline; it is perfectly insoluble in water, dissolves in boiling alcohol, from which it separates in glistening groups of very delicate needles, and is readily soluble in ether. It unites with bases, forming margarates, and in combination with glycerine (q.v.) forms the glyceride or fat known as *margarine*.

This acid occurs either in a free state or in combination with alkalies in most of the animal fluids, with the exception of the urine, and as a glyceride it is widely diffused in the animal and vegetable fats. Heintz maintains that this acid is merely a mixture of about ten parts of palmitic acid (q.v.) with one part of stearic acid (q.v.). Margarine constitutes the solid ingredient in human fat, butter, goose grease, olive oil, etc.

MARGARI'TA, or NUEVA SPARTA, an island in the Caribbean sea, belonging to Venezuela. Area, 440 sq.m.; pop. 21,000. Discovered by Columbus in 1498, Margarita was long famous for its pearl-fisheries.

MAR'GARITE, or PEARL MICA, called also corundellite, clingmanite, and pearl-glimmer, one of the hydrous silicates, belonging to the chlorite section. It crystallizes in the trimetric system, usually in intersecting or aggregated laminæ; sometimes massive with scaly fracture. Analysis by J. Lawrence Smith of a specimen from the island of Naxos gave: silica, 30.02; alumina, 49.52; peroxide of iron, 1.65; lime, 10.82; magnesia,

0.48; potash and soda, 1.25; water, 5.55 per cent. The mineral occurs in chlorite rocks at Sterzing in the Tyrol; associated with emery in Asia Minor and in the Grecian archipelago, as discovered by Dr. Smith; with corundum at Village Green, Delaware co., Penn.; at Unionville, Chester co., Penn.; with corundum in Buncombe co., N. C.; and at Katherinenburg in the Ural mountains. A variety called *diphanite* contains protoxide of manganese, associated with iron.

MARGARITONE D'AREZZO, 1212–89; b. Arezzo, Italy. He executed many pictures both in fresco and distemper. Of the former, on wood and on copper, the most celebrated specimens were in the church of San Clemente, and a work executed for the nuns of Santa Margarita. But that which Vasari calls one of his masterpieces, "on which he placed his name," was a "San Francesco," painted for the convent of the friars de' Zoccoli at Sargiano, which still exists, with his own inscription, *Margrit. de Aretio pingebat.* He is said to have excelled more as a sculptor than as a painter. His masterpiece of art was a reclining statue in marble of pope Gregory X. in the cathedral of Arezzo, which is still in good preservation.

MARGATE, a municipal borough, seaport, and famous watering-place of England, in the isle of Thanet, Kent, about 70 m. e.s.e of London. All the usual resources of a watering-place—theater, baths, libraries, assembly room, etc.—are found here; and a fine pier, which is the principal promenade. The shore, covered with a fine and firm sand, is well adapted for sea-bathing. Fishing is carried on to a considerable extent. A deaf and dumb asylum was opened in 1875. A fluctuating population of between 50,000 and 100,000 is poured into the town during the season. Pop. '71, 11,995.

MARGAY, *Felis tigrina,* a species of cat or tiger-cat; a native of the forests of Brazil and Guiana; about the same size with the wildcat of Europe; of a pale fawn color, with black bands on the fore-parts, and leopard-like spots on the hind-parts, and on the rather long thick bushy tail. It has been erroneously represented as untamable, being, in fact, capable of a complete domestication, and of being made very useful in rat-killing.

MARGINAL CREDITS, the name given to business operations, in which bankers lend the credit of their names, as it were, to their customers, and thus enable them to carry out important commercial transactions which otherwise could not be gone into, or only at excessive cost. A merchant in this country, for instance, desires to import tea or silk, but his name is not so well known on the Chinese exchanges, that bills drawn upon him by a merchant in China can be sold there at a reasonable rate of exchange. The tea or silk cannot be bought without the money being on the spot to buy it with, and if he sends out specie for that purpose he involves himself in heavy charges for freight and insurance, and loses the interest of his money while on the voyage. Before it arrives, the prices of tea and silk may have been so altered in the market that he would not be inclined to buy, and his money would thus be placed where it is not wanted. But while drafts by the merchant in China on the merchant in this country would not sell, or only at a heavy sacrifice, the drafts by the merchant in China on a banker in this country will sell at the best price. The merchant in this country therefore deposits with his banker, cash or securities equal to the amount to which he desires to use the banker's name, and receives from him *marginal credits* for the amount. These are bill-forms drawn upon the banker, but neither dated nor signed, with a margin containing an obligation by him to accept the bills when presented. The bills are dated, drawn, and indorsed by the merchant in China before being sold, so that the obligation runs from the date on which the money was actually paid, and the tea or silk is most likely in the merchant's warehouse before the bill is payable. For the transaction, the banker charges the merchant a commission to remunerate himself for the risk involved.

Many other transactions between merchants abroad and in this country can only be carried through by the acceptances of a London banker being tendered in payment, but the transactions are intrinsically the same as when marginal credits are used. The banker in the country can arrange with his customer to obtain the London banker's credit for him. Bankers—usually in London—also accept bills to a great amount for the exchange operations of foreign banks. A banker in, say Canton, buys from his customers bills drawn upon merchants in this country for a given amount, and sends them to his correspondent in London, who holds them for him and grants a credit in his favor on the security of them. The Canton banker operates upon this credit by drawing upon the London banker, and sells his drafts at the most favorable exchange. With the money received he purchases other bills, and remits them also, to be again drawn against. When these operations are made with caution and sound judgment, they are beneficial to all concerned; but when engaged in without sufficient knowledge or recklessly, they involve most disastrous consequences.

MARGRAVE. See MARQUIS, *ante.*

MARGUERITE DE VALOIS, in her youth known as Marguerite d'Angoulême sister of Francis I. of France, and daughter of Charles of Orleans, comte d'Angoulême, was b. at Angoulême, April 11, 1492. She received a brilliant, and even a profound education, but was characterized by the most charming vivacity. In 1509 she was married to Charles duke of Alençon, who died in 1525. In 1527 she was married to Henry d'Albret king of Navarre, to whom she bore a daughter, Jeanne d'Albret, mother of

the great French monarch, Henri IV. She encouraged agriculture, the arts, and learning, and to a certain extent embraced the cause of the reformation. Later, she found it necessary to be prudent, and even to return to the practices of the Roman Catholic church. But she never ceased to act with a courageous generosity towards the reformers, who always found an asylum and welcome in Navarre. She wrote a little religious work *Miroir de l'âme pécheresse*, which was condemned by the Sorbonne, as favoring Protestant doctrines. She also wrote poems and tales, and a *Heptaméron des Nouvelles* (Par. 1559), modeled on the *Decameron* of Boccaccio. Marguerite died Dec. 21, 1549.

MARHEINEKE, PHILIPP KONRAD, 1780–1846, b. Germany, educated at Göttingen, and in 1806 appointed professor extraordinary of theology at Göttingen. In 1809 he was made ordinary professor of theology at Heidelberg; and in 1811 called to the same position at Berlin, and chosen pastor of the church of the Trinity there, where he became a colleague of Schleiermacher. His studies lay principally in the direction of Christian symbolism and dogmatics. To the former he devoted his *Christliche Symbolik* (1810–14), and his *Institutiones Symbolicæ* (1830); to the latter, his *Grundlehren der Christlichen Dogmatik* (1819). The first edition of the latter work is based upon Schelling's philosophy; the second was revised in accordance with the philosophy of Hegel, of whom Marheineke was a follower, though he belonged to that small school of Hegelians who maintained that Hegel's philosophy was in accord with Christianity. His method of treatment is historical rather than dogmatic. His position was entirely independent, and he cannot be fairly classed as a Lutheran, a supernaturalist, or a rationalist. To the mystics he was strongly opposed. The positive form of his theology may be found in his *Entwurf der Praktischen Theologie* (1837). He wrote many books besides those named, and was one of the editors of Hegel's collected works.

MARIA CHRISTINA, queen of Spain, b. April 27, 1806, was a daughter of Francis I., king of the two Sicilies. In 1829 she became the fourth wife of Ferdinand VII. of Spain; who in 1830 restored the law by which, in default of male issue, the right of inheritance was given to females, and in October of that year the queen gave birth to a daughter, Isabella II., ex-queen of Spain. The Spanish liberals gladly embraced the cause of the queen, rejoicing to see the dreaded Don Carlos, Ferdinand's brother, further removed from probable succession to the throne. Ferdinand died Sept. 29, 1833, and by his testament his widow was appointed guardian of her children—the young queen Isabella and the infanta Maria Louisa, now duchess de Montpensier—and also regent, till the young queen should attain the age of 18 years. A civil war broke out, the adherents of Don Carlos seeking to place him on the throne. The event of this war, which continued till 1840, was long doubtful, and Spain was fearfully desolated by contending armies; but the queen-mother seemed indifferent to everything except the company of don Fernando Muñoz, one of the royal body-guard, whom she made her chamberlain, and with whom she was united, in December, 1833, in a morganatic marriage, which, however, was kept secret, whilst her connection with him was no secret. She had 10 children by him. A conspiracy, which broke out on the night of Aug. 13, 1836, exposed Muñoz to great danger, and led the queen-mother to concede a constitution to Spain. Her practice as regent was to adopt the course agreeable to the minister of the day, and thus her government was despotic under one ministry and liberal under another. She contrived, however, upon many occasions to embarrass the proceedings of her more liberal or constitutional ministers; but when she sanctioned by her signature the law respecting the Ayuntamientos (q.v.), a popular commotion ensued, and she gave to the new prime minister Espartero (q.v.), Oct. 10, 1840, a renunciation of the regency, and retired to France, but continued to interfere from her retirement in the affairs of Spain. After the fall of Espartero she returned to Madrid in 1843, and in October, 1844, her marriage with Muñoz, who was now made duke of Rianzares, was solemnized. Her participations in the schemes of Louis Philippe as to the marriage of her daughters, in 1846, and the continual exercise of all her influence in a manner unfavorable to constitutional liberty, made her the object of great dislike to the whole liberal party in Spain. At length, in July, 1854, a revolution expelled her from the country, and she again took refuge in France, but returned to Spain in 1864, only to retire again in 1868. She died August, 1878.

MARIA LOUISA, the second wife of the emperor Napoleon I., b. March 12, 1791, was the daughter of the emperor Francis I. of Austria. She was married to Napoleon, after his divorce of Josephine, April 2, 1810. The marriage seemed to give stability to the Bonaparte dynasty, and in some measure to afford a prospect of peace to Europe. On Mar. 20, 1811, she bore a son, who was called king of Rome. At the beginning of the campaign of 1813 Napoleon appointed her regent in his absence, but under many limitations. On the abdication of Napoleon, she went to Orleans, and thence, in company with prince Esterhazy, to Rambouillet. She was not permitted to follow her husband, but went with her son to Schönbrunn, where she remained till, in 1816, she received the duchies of Parma, Placenza, and Guastalla, on the government of which she then entered. She contracted a morganatic marriage with count von Neipperg. She died at Vienna, Dec. 18, 1847.

MARIANA, JUAN, a distinguished Spanish historian and scholar, was b. at Talavera in 1537, and in 1554 entered the then rising order of the Jesuits. His early studies, both

in languages and theology, were so brilliant that he was appointed to teach in the schools of his order, first at Rome (where the celebrated Bellarmine was one of his scholars) in 1561, afterwards in Sicily in 1565, and finally in Paris in 1569. After a residence there of seven years his health became so much impaired that he was compelled to return to his native country, and settled at Toledo, where he resided till his death, at an extreme old age, in 1624. His retirement, however, was not inconsistent with the most energetic and sustained literary activity. From an early period he devoted himself to a history of Spain, of which he published 20 books in 1592, and 10 additional books, carrying the narrative down to 1516, in 1605. The original of this history was Latin, the elegance and purity of which have secured for Mariana a place among the most distinguished of modern Latinists. Its great historical merit is also admitted, although with some drawbacks, even by Bayle. Mariana himself published a Spanish translation, which still remains one of the classics of the language. Among his other productions are a volume published at Cologne in 1609, consisting of seven treatises on various subjects; scholia on the Bible, which, although written at the age of 83, display a degree of vigor as of learning which might provoke the admiration of modern biblical students; an edition of the works of Isidore of Seville, with notes and dissertations; and several similar works. But the most celebrated of the works of Mariana is his well-known treatise, *De Rege et Regis Institutione*, which appeared in 1599, and in which is raised the important question whether it be lawful to overthrow a tyrant. Mariana decides that it is—even where the tyrant is not a usurper but a lawful king. See JESUITS. The principles of the book, in other particulars, are in the main the same as those of all modern constitutional writers. The tyrannicide doctrines of this writer drew much odium upon the entire order of Jesuits; but it is only just to observe that while, upon the one hand, precisely the same doctrines were taught in almost the same words by several of the Protestant contemporaries of Mariana (see Hallam's *Literary History*, iii. 130–140); on the other, Mariana's book itself was formally condemned by the general Acquaviva, and the doctrine forbidden to be taught by members of the order.

MARIANNA, or MARIANA, an episcopal city of Brazil, in the province of Minas-Geraes, about 12 m. e. of Ouro Preto. In the neighborhood are gold, silver, and lead mines. Pop. 8,000.

MARIANNE ISLES. See LADRONES, *ante*.

MARIAS, LAS TRES, three islands in the n. Pacific ocean, on the w. coast of Mexico, belonging to the state of Jalisco. They extend from n.w. to s.e. The largest is 15 m. in length and 8 in breadth; the next is 24 m. and the smallest 8 m. in circuit. They are all barren and uninhabited, but abound in wood, water, salt, and game, and were formerly visited by English and American whalers. Diego de Mendoza, who visited them in 1532, named them Isles de la Magdalena.

MARIA THERESA, Empress of Germany, the daughter of the emperor Karl VI., was b. at Vienna, May 13, 1717. By the pragmatic sanction (q.v.) her father appointed her heir to his hereditary thrones. In 1736 she married Francis Stephen, grand duke of Tuscany, to whom she gave an equal share in the government when she became queen of Hungary and of Bohemia, and archduchess of Austria, on the death of her father, Oct. 21, 1740. She found the monarchy exhausted, the finances embarrassed, the people discontented, and the army weak; whilst Prussia, Bavaria, Saxony, Naples, and Sardinia, stirred up by France, put forward claims to portions of her dominions, chiefly founded on the extinction of the male line of the house of Hapsburg. Frederick II. of Prussia soon made himself master of Silesia; Spain and Naples laid hands on the Austrian dominions in Italy; and the French, Bavarians, and Saxons conquered some of the hereditary Austrian territories. The young queen was in the utmost danger of losing all her possessions, but was saved by the chivalrous fidelity of the Hungarians, the assistance of Britain, and most of all by her own resolute spirit. Her enemies also quarreled amongst themselves; and the war of the Austrian succession, after lasting more than seven years, terminated in her favor by the peace of Aix-la-Chapelle in 1748. She lost only Silesia and Glatz, and the duchies of Parma, Piacenza, and Guastalla, whilst, on the other hand, her husband was elected emperor. During the time of peace she made great financial reforms; agriculture, manufactures, and commerce flourished, the national revenues greatly increased, and the burdens were diminished. The empress availed herself of the increase of the revenue for the increase of her military power. She held the reins of government herself, but was much guided by her husband and her ministers. She found at last in Kaunitz (q.v.) a minister possessed of the wisdom and energy requisite for the conduct of affairs, and in him she placed almost unlimited confidence. The *seven years' war* (q.v.) between Austria and Prussia again reduced Austria to a state of great exhaustion; but when it was concluded, the empress renewed her efforts to promote the national prosperity, and made many important reforms, ameliorating the condition of the peasantry, and mitigating the penal code. Her son Joseph was elected king of the Romans in 1764; and on the death of her husband, in 1765, she associated him with herself in the government of her hereditary states, but in reality committed to him the charge only of military affairs. She joined with Russia and Prussia in the partition of a third part of Poland (1772), after the death of Augustus III., although she at first objected to the proposed spoliation, and thought it necessary

to satisfy her conscience by obtaining the approval of the pope. Galicia and Lodomeria were added to her dominions at this time. She also compelled the porte to give up Bukowina to her (1777). The brief Bavarian war of succession ended in her acquisition of the Innthal, but led to the formation of the *fürstenbund* or *league of German princes*, which set bounds to the Austrian power in Germany. Maria Theresa died Nov. 29, 1780. Throughout her reign she displayed a resolute and masculine character, and raised Austria from deep depression to a height of power such as it had never previously attained. Although a zealous Roman Catholic, she maintained the rights of her own crown against the court of Rome, and endeavored to correct some of the worst abuses in the church. She prohibited the presence of priests at the making of wills, abolished the right of asylum in churches and convents, suppressed the inquisition in Milan, and in 1773 the order of Jesuits. She also forbade that any person, male or female, should take monastic vows before the age of 25 years. She did nothing, however, to ameliorate the condition of the Protestants in her dominions. She had three sons and six daughters. Her eldest son, Joseph II., succeeded her.

MARIAZELL', the most famous place of pilgrimage in Austria, on the n. border of the crownland of Styria, 24 m. n. of Bruck. It consists of a number of inns, or lodging-houses, and contains 1200 inhabitants. It is visited by 250,000 pilgrims annually. Here there is an image of the Virgin believed to possess the power of working miracles. During the great annual procession from Vienna, the greater number of the pilgrims of both sexes spend the night in the woods in drinking, singing, and general riot. Formerly, the processions from Gratz and Vienna took place at the same time, but owing to the fighting, as well as debauchery, that characterized the occasion, the processions were ordained to take place at different times.

MARICO'PA, a co. in e. central Arizona, bounded by New Mexico on the e.; traversed by Salt river and bounded s. by the Gila; 14,500 sq.m.; pop. in '76 estimated at 3,500. In the valleys, wheat, barley, and Indian corn are raised; the e. portion is rugged and mountainous, and here are found considerable gold, silver, copper, and lead. Apache Indians roam over the country. Chief town, Phœnix.

MARICO'PAS. See COCO-MARICOPAS.

MARIE AMÉLIE DE BOURBON, Queen of the French, wife of king Louis Philippe, 1782–1866; b. in Sicily; daughter of Frederick IV., king of the Two Sicilies; reared and educated in Sicily, Naples, and Venice. Louis Philippe, duke of Orleans, while banished from France, met her, and they were married Nov. 25, 1809. She bore him a large family of children, most of whom have been eminent for talents and high character. On the accession of Louis XVIII. they returned to Paris, and resided in France or in England until the French revolution of 1830, when Lafayette and Lafitte selected her husband as the best available leader of the liberal monarchic party, and made him king. She exhibited a repugnance to the elevation, fearing to have her husband considered a trespasser on the rights, which she seemed to respect, of the elder branch of the Bourbons. As queen she was a model of abstention from political intrigues, of every domestic virtue, and of the highest influence over her husband to good ends. Her home virtues, sympathetic nature, and public charities, made her dear to the French people, and prolonged the duration of a reign the duplicity and selfishness of which was in marked contrast to the disinterested beneficence of her own life and influence. When Louis Philippe was dethroned in 1848, she bore the fall with dignity and calmness quite in contrast with the hurried fear of her royal consort. She joined him at Claremont, England, where, under the name of the comptesse de Neuilly, she passed the remainder of her life, and closed the eyes of her husband in 1850, after 40 years of noble companionship and mutual fidelity. In her last years she sought to bring about a reconciliation with the elder branch of the Bourbon family. Five sons and three daughters were the fruit of her marriage. The eldest son, the duke of Orleans, died in 1842; the eldest daughter, a promising sculptress, died in 1839; the other sons have the titles of duke de Nemours, prince de Joinville, duke d'Aumale, duke de Montpensier. The princess Louise became queen of Belgium, and the princess Clémentine married the prince of Saxe-Cobourg. M. Trognon has published a *Vie de Marie Amélie, Reine des Français*, 1871.

MARIE ANTOINETTE DE LORRAINE, JOSEPHINE JEANNE, wife of Louis XVI. of France, was the youngest daughter of Francis I., emperor of Germany. Her mother was the famous Maria Theresa (q.v.). Marie Antoinette was born at Vienna, Nov. 2, 1755; at the age of 14 was betrothed to the dauphin; and in the following year was married at Versailles. Her reception by her husband and the king, Louis XV., was flattering enough; but her Austrian frankness and simplicity, her naïveté, unceremonious pleasantry, and detestation of rigid etiquette, scandalized Versailles. Soon after the accession of Louis XVI. (May, 1774), libels were circulated by her enemies, accusing her of constant intrigues, not one of which has ever been proved. Her faults as a queen (and, in that age, rapidly growing earnest, angry, and imbittered, they were fatal ones) were a certain levity of disposition, a girlish love of pleasure, banquets, fine dress, an aristocratic indifference to general opinion, and a lamentable incapacity to see the actual misery of France. The affair of the *diamond necklace* (q.v.) in 1785 hopelessly compromised her good name in the eye of the public, although in point of fact Marie

Antoinette was quite innocent of any grave offense. Her political rôle was not more fortunate. Loménie de Brienne and Calonne were ministers of her choice, and she shared the opprobrium called down upon them for their reckless squandering of the national finances. She strongly opposed the assembly of the notables, and in the following year, of the states-general; and, indeed, she had good reason to dread their convocation, for one of the very first things the notables did was to declare the queen the cause of the derangement of the finances. From the first hour of the revolution she was an object of fanatical hatred to the mob of Paris. Her life was attempted at Versailles by a band of assassins on the morning of Oct. 6, 1789, and she narrowly escaped. After this she made some spasmodic efforts to gain the good-will of the populace by visiting the great manufactories of the capital, such as the Gobelins, and by *seeming* to take an interest in the labors of the workmen, but the time was gone by for such transparent *shamming* to succeed. The relentless populace only hated her the more. At last she resolved on flight. Her husband long refused to abandon his country, and she would not go without him. A dim sense of kingly duty and honor was not wanting to Louis, but after the mob stopped his coach (April 18, 1791), and would not let him go to St. Cloud, he consented. The flight took place on the night of the 20th June. Unfortunately, the royal fugitives were recognized, and captured at Varennes. From this time her attitude became heroic; but the French people could not rid themselves of the suspicion that she was secretly plotting with the allies for the invasion of the country. After the useless effort to defend the Tuileries (Aug. 10, 1792), she was confined in the Temple, separated from her family and friends, and subjected to most sickening humiliations. On Aug. 1, 1793, she was removed to the Conciergerie, by order of the convention, condemned by the revolutionary tribunal (Oct. 15), and guillotined next day. See *Mémoires sur la vie privée de Marie Antoinette*, by Mme. Campan (1823); Feuillet de Conches, *Louis XVI., Marie Antoinette et Mdme. Élisabeth* (1864–73); D'Arneth, *Correspondance secrète entre Marie Thérèse et le Comte Mercy d'Argenteau, avec des lettres de Marie Thérèse et Marie Antoinette* (2d ed., 1875); and Yonge, *Life of Marie Antoinette* (1876).

MARIE DE' MEDICI, wife of Henri IV. of France, was the daughter of Francis I., grand-duke of Tuscany, and was born at Florence, April 26, 1573. She was married to Henri, Dec. 16, 1600, and in the following September gave birth to a son, afterwards Louis XIII. The union, however, did not prove happy. Marie was an obstinate, passionate, waspish, and withal dull-headed female, and her quarrels with Henri soon became the talk of Paris. She was—as such women are apt to be—wholly under the influence of favorites. A certain couple, who professed to be man and wife, Leonora Galigaï and Concini, exercised a most disastrous influence over her mind, and, of course, encouraged her dislike to her husband. The assassination of Henri (May 14, 1610) did not much grieve her, and she was even suspected of complicity in the act, but nothing was ever ascertained that could incriminate her. For the next seven years she governed as regent, but proved as worthless a ruler as she had been a wife. After the death of Concini a sort of revolution took place. Louis XIII. assumed royal power. Marie was confined to her own house, and her son refused to see her. Her partisans tried to bring about a civil war, but their attempts proved futile; and by the advice of Richelieu, then bishop of Luçon, she made her submission to her son in 1619, and took her place at court. Marie hoped to win over Richelieu to her party, but she did not in the least comprehend that mighty genius; however, she soon enough found out that he had no mind to be ruled by her, whereupon she resolved, if possible, to undermine his influence with the king. Her intrigues for this purpose failed; she was imprisoned in Compiègne, whence she escaped, and fled to Brussels in 1631. Her last years were spent in utter destitution, and she is said to have died in a hayloft at Cologne, July 3, 1642.

MARIE GALANTE, an island in the West Indies, one of the Lesser Antilles, belongs to France, and lies 17 m. s.e. of Guadeloupe. Area, about 60 sq.m., covered for the most part with wood, and surrounded by steep rocky shores. The cultivated soil produces sugar, coffee, and cotton. Cattle and horses are abundant, the latter of a highly esteemed breed. Its chief town, Grandbourg, or Marigot, on the s.w. coast, has a population of 2,000. The population of the island is 13,000. Marie Galante is so-called from the name of the ship commanded by Columbus when he discovered the island in 1493.

MARIENBAD, one of the most frequented of the Bohemian spas, 33 m. n.w. of Pilsen, at an elevation of almost 2,000 ft. above the level of the sea. The springs of Marienbad have long been used by the people of the vicinity, but it is only since the commencement of the present century that it has become a place of resort for persons from distant parts of the world. The springs are numerous, varying in temperature from 48° to 54° Fahr. They are saline, containing sulphate of soda and various alkaline ingredients, but differing considerably in their composition and qualities. They are used both internally and in the form of baths. Great quantities of the waters of some of the springs are exported to distant places. Marienbad is surrounded by wooded heights, has a population of 1600, and is visited every season by upwards of 9,000 patients.

MARIENBERG, a t. of Saxony, in the circle of Zwickau, 38 m. s.w. of Dresden. It has manufactures of linen, lace, and steam-engines, and the neighboring mines give employment to a great number of the inhabitants. Marienberg has mineral baths, and an establishment for the cold-water cure. Pop. '75, 5,956.

MARI'ENBURG, an old t. of Prussia, in the province of Prussia, on the Nogat, 28 m. s.e. of Danzig. It was long the seat of the grand masters of the Teutonic order (q.v.) of knights, who removed from Venice hither in the year 1300. The first fortress of the knights, however, was founded here in 1274. Marienburg remained in the hands of the knights till 1457, when it was taken by the Poles. The castle, or palace, in which 17 grand masters had resided, a noble edifice in a species of Gothic peculiar to the vicinity of the Baltic, was restored in 1820. Pop. '75, 8,538.

MARI'ENWERDER, one of the most prosperous and beautiful towns of the province of Prussia, in the kingdom of Prussia, is picturesquely situated on an elevation, about 2 m. e. of the Vistula, and 47 m. s.s.e. of Danzig. It was founded in 1233 by the Teutonic order of knights, and its old castle was the residence of a commander of that order. The town derives its prosperity chiefly from being a residence of numerous government officials. Manufactures of various kinds are carried on, and fruit is extensively cultivated. Pop. '75, 7,627.

MA'RIES, a co. in s. central Missouri; drained by the Gasconade river and its affluents; 550 sq.m.; pop. '80, 7,323. The surface is broken and hilly, and only in the valleys is there much fertility. Indian corn is the chief product, 163,479 bushels being raised; 79,243 of wheat. The baser metals are found, but not in great abundance. Chief town, Vienna.

MARIETTA, the chief t. in Washington co., Ohio, on the e. bank of the Muskingum, at its union with the Ohio river; and the terminus of the Marietta and Cincinnati, and Marietta, Pittsburg, and Cleveland railroads; 150 m. from Columbus, 175 m. from Cleveland, and 300 m. from Cincinnati by way of the rivers; pop. '70, 5,218. The town was settled by New England emigrants in 1788, and is the oldest town in Ohio. The town is neatly laid out and handsomely embellished, and is the seat of Marietta college, which was chartered in 1835 and graduated its first class in 1838. Marietta is the center of an extensive business in petroleum, and is not distant from large deposits of coal and iron. There are 3 newspapers, 4 banks, a library, city hall, art gallery, and a very large number of refineries, factories, foundries, shops, and stores. The schools have long been noted for their superior qualities. A description of ancient mounds and works on the site of the city will be found in *Ancient Monuments of the Mississippi Valley*, by Squier and Davis. These have been in great measure destroyed by the building of the city, but traces of them still remain. The name Marietta was bestowed in honor of the French queen, Marie Antoinette.

MARIETTA COLLEGE, at Marietta, Washington co., O., was founded in 1835. The grounds occupy a pleasant square, and the college has four buildings. In 1878 it had 11 instructors and 80 students, G. W. Andrews, D.D., LL.D., president.

MARIETTE, AUGUSTE ÉDOUARD, b. at Boulogne-sur-Mer, 1821; became professor of grammar and design, and while engaged in these duties was drawn to the study of archæology. Attracting attention by an article published in 1847 on the history of his native town, he was made assistant in the Egyptian museum of the Louvre, where he became so intelligent a disciple of the lore of Champollion in Egyptian hieroglyphics that he was sent to Egypt to gather Coptic manuscripts. While there he searched for the true site of Memphis, and by his familiarity with ancient authors, not only found the remains, but identified the temples, monuments, and tombs, by their descriptions. His discoveries were gratefully acknowledged by the French government, and increased means for investigation were placed in his hands by the duke de Luynes. His principal excavations for Memphis were made 4 m. from the spot where the archæologists had previously searched, and resulted in uncovering an avenue of sphinxes, the temple of Serapis mentioned by Strabo, one of the most splendid structures of granite and alabaster of the ancient time, in which were found the sarcophagi of the bulls of Apis from the 19th dynasty to the time of the Romans. The labors of 1500 men under his hand brought to light 2,000 sphinxes and between 4,000 and 5,000 statues, and inscriptions and curiosities without number. Some of the statues were evidently of Grecian art. The explorations have served to confirm the fact of the greatness of the city of Memphis, its wealth and luxury. His excavations around the great sphinx of Gizeh brought to light many new facts and curiosities, which have been added to the collections of Egyptian curiosities in the Louvre. On his return to Paris in 1854 he was made conservator of the Egyptian museum. In 1858 he was again in Egypt following up his former searches with a large force of workmen, removing the sands that covered the temples of Elfou, Karnak, Médinet-Abou, etc. The viceroy of Egypt then made him conservator of the monuments of Egypt, with title of bey, and charged him with the formation of a collection of his precious discoveries at Boulak. In 1873 the institute of France awarded him the biennial prize of 20,000 francs. He is considered the most eminent of French *Egyptologues*. The following are some of his works: *Mère d'Apis*, 1856, 8vo, a light on the religion of the Egyptians; *Choix de Monuments et de dessins, découverts ou exécuté pendant le déblayement du Sérapéum de Memphis*, 1856, 4to; the *Sérapéum de Memphis*, in folio, with plates, 1857–64; *Aperçu de l'histoire d'Egypt*, 1864, 8vo; *Nouvelle table d'Abydos*, with plates, 1865, 8vo; *Fouelles exécutée en Egypt, en Nubie, et au Soudan, d'après les ordres du viceroi*, folio, with maps and plates, 1867; *Notice des principaux*

monuments du musée de Boulak, 1870, 8vo; *Les Papyrus égyptiens du musée de Boulak*, folio, 1871; and *Album du musée de Boulak*, folio, illustrated by 40 superb photographic plates, representing 600 objects of Egyptian art, published in 1873. Upon his death the khedive took charge of the embalming of his body, and its deposit in an ancient sarcophagus.

MARIGLIANO, a t. of s. Italy, province of Caserta, not far from Nola. It has a castle and several churches, one of which has a good collection of pictures. Pop. '70, 5,182.

MARIGNA'NO. See MELEGNANO, *ante*.

MARIGOLD, a name given to certain plants of the natural order *compositæ*, sub-order *corymbiferæ*, chiefly of the genera *calendula* and *tagetes*. The genus *calendula* has the achenia remarkably curved, variously toothed, and very rough on the back. The species are annual and perennial herbaceous plants and shrubs, of which some of the former are found in the countries bordering on the Mediterranean, the latter chiefly in s. Africa. POT MARIGOLD (*C. officinalis*) is an annual, a native of France and the more southern parts of Europe, with an erect stem, 1 to 2 ft. high, the lower leaves obovate on long stalks, and large, deep yellow flowers. It has long been very common in British gardens, and there are varieties with double flowers. The whole plant has a slight aromatic odor, and a bitter taste. It was formerly in great repute as a carminative, and was regarded also as an aperient and sudorific. The florets were the parts used, and they were dried in autumn, to be preserved for use. They are often employed to adulterate saffron, and sometimes for coloring cheese. They were formerly a frequent ingredient in soups, and are still so used in some parts of England.—The genus *tagetes* consists of annual and perennial herbaceous plants, natives of the warmer parts of America, although *T. erecta*, one of those most frequently cultivated in Britain, bears the name of AFRICAN MARIGOLD; and *tagetes patula*, another annual well known in our flower-borders, is called FRENCH MARIGOLD. Both species are Mexican. They have been long in cultivation, and with a little assistance of a hot-bed in spring, succeed well even in Scotland, and are much admired for the brilliancy of their flowers.—CORN MARIGOLD is a *chrysanthemum* (q.v.).—Marsh Marigold (q.v.) has no botanical affinity with the true marigolds.

MARIN', a co. in w. California, bounded w. by the Pacific, s. and e. by San Pablo bay, San Francisco bay, and the Golden Gate, the last separating it from the city of San Francisco; 500 sq.m.; pop. '80, 11,325. It is traversed by the North Pacific Coast railroad. The surface is marked by many hills, the highest of which, Table mountain, is 2,600 ft. high. It is the largest butter-producing county in the state, the amount in 1870 being over 2,000,000 pounds. Chief city, San Rafael.

MARI'NA, MALINTZIN, or MALINCHE, b. Mexico, probably in the last years of the 15th century. She was of a noble family in the province of Guazacoalcos, but when a child was sold in slavery to the Maya Indians. Soon after Cortez invaded Mexico she became his interpreter and his mistress. Their son, don Martino Cortez, attained to considerable importance in Mexico. She was afterwards married to Juan de Jaramillo, and was living as late as 1550.

MARINED, a term applied in heraldry to an animal whose lower part is terminated like the tail of a fish.

MARINE ENGINE. See STEAM-ENGINE.

MARINE FORTIFICATION differs from land fortification in that the approaches of the enemy which are to be resisted take place on the level of the sea, so that he can come near without having to overcome the dangerous slope of the glacis. The combat is simply one between two powerful batteries, and the question to be decided is whether the ship or the fort will first be placed *hors de combat;* the ship having ordinarily the largest number of guns, while the fort has more solid battlements, and its fewer guns of great caliber can be fired with a steadiness unattainable on so shifting a base as the ocean. Under these circumstances, the less relief a sea-fortress has the better, as by so much the less is it likely to be hit from the shipping. Its walls are usually built perpendicular, or nearly so. The magazines and quarters for the men are bomb-proof, as also are the casemates, from which the guns are usually fired, although sometimes, as in the martello-tower, the gun is worked on the top of the structure.

Sea-fortifications may be of various importance, the simplest being the battery consisting of a mere parapet formed in a cliff or on a hill, and mounted with guns to command the sea; these are generally built in such concealed situations that it is hoped the hostile ships will not perceive them until they actually open fire. They are numerous all around the British coast. Next greater in importance is the martello-tower (q.v.). More powerful still are the beach-forts, such as those which on either shore defend the entrance to Portsmouth harbor: these are constructed of the most solid masonry, faced with massive iron plates, and armed with guns of the heaviest caliber, sweeping the very surface of the sea, so as to strike an approaching ship between wind and water. The guns are usually in bomb-proof casemates, and the fort is often defended on the land side if the coast be level; if, however, higher ground be behind, this would be useless, and then the sea-front alone is defensible. Most terrible of all sea-forts, how-

ever, are the completely isolated forts, with perpendicular faces and two or three tiers of heavy guns. Such are the tremendous batteries which render Cronstadt almost inapproachable, and by which Spithead and Plymouth sound are now fortified. These forts are generally large, with all the requisites for a garrison to maintain itself; against them wooden ships stand no chance, and in the American civil war fort Sumter, at Charleston, showed itself no mean antagonist for ironsides. In such forts iron is employed as the facing, in plates of such vast thickness and weight that it is supposed no ship can ever possess any comparable resisting power; and, as they are armed with guns the smallest of which will probably be 300-pounders, it is expected that they will be able to destroy any fleet that could be sent against them.

At the present day the value of sea-fortifications is disputed, as iron-plated vessels may pass them with impunity unless the artillery in the fort be so heavy as to destroy the armor of the ships. In the long run, however, it is apparent that the fort can command the greater power, for its armor may be of any thickness, while that of the ship must be limited by her floating powers, and, on the other hand, the limit to the size of artillery must be sooner reached in a ship than in a solid and stationary fortress.

MARINE'O, a t. of Sicily, in the province of Palermo, and 11 m. s. of the town of Palermo, near a small river which flows into the gulf of Palermo. Pop. 8,360.

MARINER'S COMPASS. See COMPASS, *ante*.

MARINES are soldiers that serve on board ships of war. The men are drilled in all respects as soldiers (light infantry), and therefore on shore are simply ordinary land-forces. On board ship they are trained to seamen's duties, but still preserving their military organization. Their ordinary functions are as sharpshooters in time of action, and at other times to furnish sentries for guarding the stores, gangways, etc. They are useful as exercising a good control over the less rigidly disciplined sailors, and, having always firearms and bayonets ready, they have often been instrumental in suppressing the first outbreaks of mutiny. The royal marines are divided into three divisions of light infantry and one of artillery. Promotion goes by seniority throughout the artillery and infantry respectively. In rank marine officers correspond with army officers of similar grades according to seniority; as a corps the marines take place between the 49th and 50th regiments of infantry of the line. Every ship, on being commissioned, has her complement of marines drafted into her. The uniform is red, with blue facings and white belts. On their colors the men proudly bear the word "Gibraltar," in the famous defense of which fortress they bore an heroic part.

Marines were first established, as a nursery from whence to obtain seamen to man the fleet, by order in council of Oct. 16, 1664. Their utility becoming conspicuous, other regiments of marine forces were raised, so that by 1741 there were 10,000 men, and in 1759 as many as 18,000. During the great French war the number rose above 30,000, but a great reduction took place after peace was concluded. By the navy estimates of 1875–76, 14,000 marines were provided, including 2,900 artillery, at a cost for the year of £940,417. Their government rests solely with the admiralty.

MARINES (*ante*). The introduction of marines into the American army took place by act of congress passed Nov. 10, 1775, by which two battalions of this arm were directed to be organized. Again, by act of July 11, 1798, "establishing and organizing a marine corps," this body became an established element in the naval force of the United States, liable to do duty either on board vessels of war at sea, or in forts or otherwise upon shore, as might be directed by the president. The commandant of the corps has the rank and pay of col. It has no regimental organization, however, but "may be formed into as many companies or detachments as the president may direct." When employed on naval service the marines are subject to the laws and regulations which govern the navy; but if engaged on shore duty they are amenable to the authority of the articles of war. The number of marines was fixed by the act of July, 1861, at 3,074 enlisted men, but this is practically lessened by the amount of the annual appropriations for the naval department. The United States marine corps consisted in 1880 of 86 officers and 1500 enlisted men.

MARINE-STORE DEALERS, in point of law, are subjected to certain restrictions as regards the business they carry on, in order to keep some check on their relations with thieves and other vendors of stolen property. They are bound, under a penalty of £20, to have their name and the words "dealer in marine stores" distinctly painted, in letters not less than 6 in. in length, over their warehouse or shop; to keep books stating the name of the person from whom they bought or received the respective articles in their possession; not to purchase marine stores from any person apparently under 16 years of age; not to cut up any cable or article exceeding five fathoms in length without a permit from justices of the peace. By the act 24 and 25 Vict. c. 101, dealers in old metals have also been subjected to similar restrictions. Whenever a dealer in old metal has been once convicted of being in possession of stolen property, justices of the peace may order him to be registered at the chief police-office of his district, and he shall keep a book containing entries of the goods he has and of the person from whom obtained, etc.

MARINI, GIOVANNI BATISTA, an Italian poet, b. at Naples in 1569. After a period of fruitless study, Marini abandoned jurisprudence for the more congenial pursuit of

poetry, a decision which so incensed his father as to lead to his expulsion from home. All through life, Marini seems to have courted troubles by his unbridled licentiousness, and many of his best compositions are polluted with a shameless obscenity, unavailingly deplored by the poet at the approach of death, when he expressed the desire that they should be suppressed and destroyed. Marini quitted Naples for Rome, and finally followed in the suite of cardinal Aldobrandini to Turin, where he was at first received with flattering notice from the reigning prince, Charles Emmanuel; but on the publication of some biting satirical verses, he was thrown into prison. On his release, he repaired to France, where Marie de' Medici received him with marked favor, and conferred on him a liberal pension. In his poem *Il Tempio* he celebrates this queen's noble qualities. His best work, the *Adone*, was written during his residence in France, and on its publication, he revisited his native country (1622), and died at Naples, aged 56, in 1625, in the midst of high public festivities in his honor. He is the founder of the *Marinist* school of poetry, of which the essential features are florid hyperbole and false overstrained imagery.

MARI'NO. See SAN MARINO, *ante*.

MARI'NO (anc. *Bovillæ*), a market-t. of central Italy, province of Rome, and 12 m. s.e. of the city of Rome, near lake Albano. Marino is situated on a high hill above a plain, and is surrounded by strong walls and towers, which were erected by the Colonna in 1480, and add much to its picturesque beauty. According to the writer of *Murray's Handbook*, the long street called the Corso, the piazza of the Duomo, and the fountain would do credit to many towns of more importance. At the foot of the hill of Marino, lying between it and the ridge of Alba Longa, is a deep glen beautifully wooded, called the *Parco di Colonna*. This valley is highly interesting as the site of the *Aqua Ferentina*, memorable as the spot on which the Latin tribes held their general assemblies, from the destruction of Alba to the consulship of P. Decius Mus, 338 B.C. Marino is also interesting in the history of the middle ages as the stronghold of the Orsini family, who first appear in the 13th c. in connection with their castle of Marino. In the 15th c. it became the property of the Colonna family, who have retained it almost without interruption to the present time. Pop. 6,500.

MARIO, GIUSEPPE, Marquis de Candia, was b. at Turin in 1810, of an aristocratic family, and evinced from his boyhood high musical abilities. In 1830 he received his commission as officer in the chasseurs Sardes; but having involved himself in some youthful escapade, was ordered from Genoa to a temporary retreat at Cagliari. From thence he threw up his commission, and finally escaped to Paris, on his resignation not being accepted. The young Sardinian deserter speedily won his way into the most exclusive circles of fashionable Paris, both by the genuine, manly stamp of his nature, and the charm of his exquisite voice. Having contracted debts, however, he accepted the appointment of first tenor of the opera, with a salary of 1500 francs per month; at the same time he changed his name from marquis of Candia to Mario. After a term of two years' study at the conservatoire, Mario made his début, on Dec. 2, 1838, in *Robert le Diable*, and achieved the first of a long series of operatic triumphs. At the théâtre Italien, he took rank with Rubini, Lablache, Malibran, Sontag, and Grisi; and by none of these great artists was he excelled in purity, sweetness, method, and taste. From 1845 to 1850 he fulfilled an engagement in Russia, and on his return appeared in London, where his success was immense. Mario's operatic career was a succession of brilliant and remunerative engagements. In his private capacity, he was esteemed for his large-handed liberality, and for his noble assistance to struggling artists. His répertoire embraced all the great works of Rossini, Bellini, Donizetti, and Verdi. Mario took farewell of the London stage in 1871.

MARIOL'ATRY (Gr. *Maria*, and *latreia*, adoration), a name given by polemical writers to the worship paid by Roman Catholics to the Virgin Mary. This name is intended to imply that the Catholic worship of the Virgin is the supreme worship of *latreia* or adoration, which Catholics earnestly disclaim, although, from her relation to our Lord, they hold her worship, which they style *hyperdulia*, to be higher than that of all other saints. See INVOCATION OF SAINTS. Many examples of prayers addressed to Mary, of acts of worship done in her honor, and of expressions employed regarding her are alleged by controversialists, for the purpose of showing that the worship of Mary in the Roman church is in effect "adoration." Such are (see Farrar's *Ecclesiastical Dictionary*, p. 372) the "Litany of the Sacred Heart of Mary;" the adaptation of the Athanasian creed as a profession of faith regarding her; addresses to her as the "hope of the desponding, and refuge of the destitute;" professions that "her son has given her such power that whatever she wills is immediately done;" kneelings and prostrations before her image; pilgrimages in her honor. To these and similar allegations, Roman Catholics reply that many of the objected prayers and devotional practices are entirely unauthorized by the church, and that some of them are undoubtedly liable to misinterpretation; but they further insist that all such prayers, however worded, are to be understood, and are, in fact, understood by all Roman Catholics, even ordinarily acquainted with the principles of their faith, solely as petitions for the intercession of Mary, and as expressions of reliance, not on her own power, but on the efficacy of her prayers to her son. It would be out of place in this work to enter into such controversies, and we shall content ourselves with a brief account of the origin and nature of the worship of the Virgin Mary in the

church, and of its present condition, as it is professed by those religious bodies among which the practice now prevails.

Although no trace is found in the New Testament of any actual worship of the Virgin Mary, yet Roman Catholic interpreters regard the language of the angel Gabriel, who saluted her as "full of grace," or highly "favored," and as blessed "among women," and her own prediction in the canticle of the magnificat, that "all nations should call her blessed" (Luke i. 48), as a foreshadowing of the practice of their church; and they rely equally on the language employed by the early fathers, as, for instance, Irenæus, regarding the Virgin, although Protestants consider it as having reference to the incarnation. But it seems quite certain that, during the first ages, the invocation of the Virgin and the other saints must have held a subordinate place in Christian worship; the reason for which, according to Roman Catholics, was probably the fear which was entertained of reintroducing among the recent converts from paganism the polytheistic notions of their former creed. But from the time of the triumph of Christianity in the 4th c., the traces of it become more apparent. St. Gregory Nazianzen, in his panegyric of the virgin martyr Justina, tells, that in her of peril she "implored Mary the Virgin to come to the aid of a virgin in her danger" (Opp. tome i. pp. 278, 279). St. Ephraim, the Syrian, in the same age, uses language which is held by Roman Catholics to be equally favorable to their view; and the fact that about this time there arose a sect, the Collyridians, who were condemned for the actual *adoration* of the Virgin, seems to them to prove that some worship of her must have existed in the church, out of which this excessive worship of the Collyridians grew. But it was only after the heresy of Nestorius that the worship of Mary seems to have obtained its full development. His denial to her of the character of mother of God, and the solemn affirmation of that character by the ecumenical council of Ephesus (430 A.D.), had the effect at once of quickening the devotion of the people, and drawing forth a more marked manifestion on the part of the church of the belief which had been called into question. The 5th and 6th centuries, both in the east and in the west, exhibit clear evidence of the practice; and the writers of each succeeding age till the reformation speak with gradually increasing enthusiasm of the privileges of the Virgin Mary, and of the efficacy of her functions as a mediator with her son. St. Bernard, and, still more, St. Bonaventura, carried this devotional enthusiasm to its greatest height; and the popular feeling found a stronger and still more strong manifestation in the public worship of the church. From a very early period, we find several festivals of the "blessed Virgin;" but in the centuries to which we refer, the number received large additions. The institution of the "Rosary of the Virgin Mary," the appointment of a special office in her honor, and more than all, the fame of many of the sanctuaries which were held to be especially sacred to her worship, gave a prominence to the devotion which Protestants find it difficult to reconcile with the honor which they hold due to God alone.

The chief festivals of the Virgin, common to the western and eastern churches, are the conception, the nativity, the purification, the annunciation, the visitation, and the assumption. All these festivals are retained in the English calendar. The Roman church has several special festivals, with appropriate offices—all, however, of minor solemnity.

MARION, a co. in n.w. Alabama, having the state line of Mississippi for its n.w. boundary; bounded on the n.e. by the Big Bear river; 900 sq.m.; pop. '80, 9,364—9,362 of American birth, 523 colored. It is drained by the Buttahatchie and Sipsey creeks, branches of the Tennessee and Tombigbee rivers. Its surface is undulating, rising into hills in some sections containing beds of bituminous coal, a large proportion being covered with forests, Its agricultural products are tobacco, cotton, wool, sweet-potatoes, butter, honey in large quantities, sorghum, oats, corn, rye, and wheat. Cattle, sheep, and swine are raised. Seat of justice, Pikeville.

MARION, a co. in n. Arkansas, having the state line of Missouri for its n. boundary, the White river for its s.e., and the Buffalo Fork, one of the chief affluents of the White river, for a part of its s. border; 600 sq.m.; pop. '80, 7,907—7,895 American birth, 43 colored. It is drained by Crooked creek, flowing centrally through it into White river, and has a surface formed of the ridges of the Ozark mountains, partially covered with groves of chestnut, ash, hickory, etc. Its soil is adapted to the raising of fruit, live stock, every kind of grain, tobacco, cotton, sweet-potatoes, and sorghum. Honey is produced in large quantities, and the products of the dairy. Its mineral products are lead ore, variegated marble, and silurian limestone. Seat of justice, Yellville.

MARION, a co. in n. Florida, intersected by the Ocklawaha river, flowing into lake Griffin in the next county; has for its n.e. boundary lake George and the St. John's river, and has Orange lake in the extreme n., and smaller lakes, including Bryant and Ware in the e. section; 2,000 sq.m ; pop. '80, 13,046—12,961 of American birth, 8,305 colored. The Withlacoochee river forms part of its s.w. boundary. Extensive forests of good building timber grow along the river banks and surround the lakes; in other sections the level surface spreads out into fertile plains. Its agricultural products are tropical fruits, rice, oats, cotton, and corn, and its soil is specially adapted to the cultivation of sugar-cane and oranges. Carriages are manufactured. Seat of justice, Ocala.

MARION, a co. in w. Georgia, drained by the head waters of the Flint river and Kinchafoonee creek; 450 sq.m.; pop. '80, 8,598—8,595 of American birth, 4,307 colored. The Southwestern railroad crosses the extreme n.w. corner. Its surface, generally level, is covered to a great extent with hardwood timber, and the growth of swampy districts. Its soil produces fruit, oats, corn, tobacco, cotton, rye, wool, sweet potatoes, butter, honey, and sugar-cane. Much attention is paid to the raising of live-stock. Seat of justice, Buena Vista.

MARION, a s. central co. of Illinois, intersected by the Illinois Central and Ohio and Mississippi railroads; 576 sq.m.; pop. '80, 23,691. It is a prairie country, the productions being grain, cattle, and wool. Co. seat, Salem.

MARION, a central co. of Indiana, the converging point of 12 completed railroad lines (see INDIANAPOLIS); 420 sq.m.; pop. '80, 102,780. It possesses a level surface, except in the northern part. The soil is fertile, producing grain and hay in large quantities. Other productions are cattle and wool. Co. seat, Indianapolis.

MARION, a s. central co. of Iowa, watered by the Des Moines river, and intersected by the Des Moines Valley railroad. It has a varied surface and fertile soil. The productions are coal, iron, cattle, grain, and wool. Co. seat, Knoxville.

MARION, a co. in s.e. central Kansas; 950 sq.m.; pop. '80, 12,457—American, 3,603. The increase in population is most remarkable, the census of '70 giving but 768; the estimate of '75, 5,907; and of '78, 8,306. The county is drained by Cottonwood creek, which furnishes water-power. The surface is a rolling plain, and produces corn, wheat, and hay in great abundance. Stock-raising is a leading industry. Traversed by Atchison, Topeka and Santa Fe railroad. Chief town, Marion Center.

MARION, a central co. of Kentucky, watered by branches of Salt river, and intersected by a branch of the Louisville and Nashville railroad; 335 sq.m.; pop. '80, 14,691. The surface is varied in character, the soil is fertile, and grain, tobacco, and wool are produced in large quantities, while live stock is largely raised. Co. seat, Lebanon.

MARION, a co. in s.w. Mississippi, having the state line of Louisiana for its s.w. border, is intersected by the Pearl river in the w. section; about 1500 sq.m.; pop. '80, 6,901—6,899 of American birth, 2,450 colored. It is drained by Black and Red creeks, affluents of Leaf river. Its surface is generally level, partially tillable, and largely covered with timber. Its soil is sandy, and not remarkably productive; but there is a fair farming district near the Pearl river, where the products are tobacco, cotton, wool, sweet potatoes, butter, honey, sugar-cane, rice, oats, corn, and live stock. Seat of justice, Columbia.

MARION, a co. in n.e. Missouri; 460 sq.m.; pop. '80, 24,837—22,828 of American birth. The Mississippi river bounds it on the e., and it is also drained by the North and South rivers, and the n. and s. forks of the Fabius. It is traversed by the Hannibal and St. Joseph railroad. The surface is in part prairie and in part forest. Principal products: wheat, oats, hay, and Indian corn. Chief town, Palmyra.

MARION, a n. central co. of Ohio, intersected by the Atlantic and Great Western and Bee-line railroads; 360 sq.m.; pop. 80, 20,564. It is a level and fertile region, producing, cattle, grain, and wool, and manufacturing large quantities of lumber. Co. seat, Marion.

MARION, a co. in w. Oregon, bounded e. by the Cascade range, and w. by the Willamette river, by which, with its tributaries, it is drained; pop. '80, 14,576. It is traversed by the Northern California railroad. The principal products are the cereals, and in 1870 there were raised 232,091 bushels of wheat, and 164,087 of oats. Sheep-breeding is carried on to some extent. The e. part of the county is hilly and mountainous, but contains considerable quantities of the precious metals, and of iron and coal. The chief town, Salem, is also the capital of the state.

MARION, a co. in e. South Carolina, having the Little Pedee river for its e. boundary, Lynch's river for its s. and s.w.; intersected in the w. section by the Great Pedee, and having the state line of North Carolina for its n.e. boundary; 1050 sq.m.; pop. '80, 34,107—34,042 of American birth, 18,228 colored. The Wilmington, Columbia and Augusta railroad crosses it centrally. Its surface is generally level and equally divided between forest and cultivated land. Its soil is a sandy loam, very fertile in some localities, producing fruit, tobacco, cotton, oats, corn, sweet potatoes, wool, wine, butter, sugar-cane, and large quantities of honey, rye, and wheat; other products are turpentine and tar. Cattle, sheep, and swine are raised. Seat of justice, Marion Court-House.

MARION, a co. in e. Tennessee, having the state line of Alabama for its s. boundary, is drained by the Tennessee river running at the foot of a range of the Cumberland mountains in the s.e. section, and the Sequatchie river emptying into it in the same region; 700 sq.m.; pop. '80, 10,911—10,712 of American birth, 1369 colored. It is traversed in the s. section by the Bridgeport, Alabama, to Victoria, Tennessee, division of the Nashville, Chattanooga and St. Louis railway; by the Sequatchie branch centrally to Victoria; and the Sewanee railroad crossing its n.w. corner. A large proportion of the surface, which along the rivers rises into steep high bluffs or buttes, is covered with forests or occasional groves, and the soil is productive. Corn, tobacco, cotton, fruit,

wool, sweet potatoes, wine, and great quantities of honey are produced; other products are sorghum, maple sugar, every kind of grain, and live stock in large numbers. Bituminous coal, iron ore, and fire-clay are mined, and its principal industries are connected with their mining and manufacture. In the n.w. are medicinal springs impregnated with iron. Seat of justice, Jasper.

MARION, a co. in n.e. Texas, having the state line of Louisiana for its e. boundary, is drained by the navigable Caddo lake 20 m. in length, comprising a third of the e. section, and Big Cypress bayou, flowing through it from n.w. to the s.e. section; about 300 sq.m.; pop. '80, 10,985—10,745 of American birth, 7,229 colored. It is traversed centrally by the Jefferson division of the Texas and Pacific railroad, forming a junction with the East Line and Red River railroad at Jefferson. Its surface is uneven and well wooded with every kind of timber. Iron ore is among its mineral products, and mineral springs appear in some localities. Its soil has every element of fertility, especially the bottom lands, producing sweet potatoes, corn, live stock in general; great numbers of beef cattle and large quantities of cotton are raised, which are among its exports. Its manufactories include iron foundries and tanneries. Seat of justice, Jefferson.

MARION, a co. in n. West Virginia, intersected from s.w. to n.e. by the Monongahela river, and from n.w. to s.e. by the Baltimore and Ohio railroad; 330 sq.m.; pop. '80, 17,198—17,052 of American birth, 155 colored. The Monongahela river is navigable to Fairmont, and the co. is also drained by Trygart's Valley river. Its surface is uneven, and largely covered with forests. Its soil is very fertile, and its agricultural products are fruit, buckwheat, Indian corn, wool, flax, maple sugar, sorghum, oats, wheat, honey, live stock, and dairy products. Among its mineral products are bituminous coal, iron ore, and glass sand. Its manufactories are tanneries and lumber mills; also, thrashing-machines, flour, cigars, furniture, and machinery are manufactured, and coal is mined. Seat of justice, Fairmont.

MARION, the chief t. of Perry co., in w. central Alabama; pop. 2,646. It is 28 m. from Selma, on the Selma, Marion and Memphis railroad, and is the seat of the Howard Baptist college, founded in 1837; and also of the Marion and Judson seminaries for girls. There are two weekly papers, a bank, six churches, a few machine-shops; and the place has a good trade in cotton and corn with the surrounding country.

MARION, a t. in Ohio, near the center of Marion co., 85 m. n.e. of Dayton, 40 m. n. of Columbus. It is on the Atlantic and Great Western, Columbus and Toledo, and Cleveland, Columbus, Cincinnati and Indianapolis railroads. It has a court-house, 3 newspapers, banks, and 9 churches. There are grain-elevators, machine and carriage shops, and manufactories of chairs, sashes and blinds, chains, and rakes. Pop. of whole township, '70, 3,486.

MARION, FRANCIS, 1732–95; b. near Georgetown, S. C. He received a scanty education, and after a trial of seafaring life, in which he was wrecked and with difficulty rescued, engaged in farming. When the war with the Cherokee Indians arose, 1759, he immediately enlisted, and as a cavalry lieut. did good service in the campaigns of 1759–61. At the outbreak of the revolution, Marion was chosen a delegate to the South Carolina congress, but soon organized a company of volunteers in his neighborhood, and placed it under the command of col. William Moultrie. His first active service was in Charleston harbor, and later in the defense of fort Moultrie, June 28, 1776; and his gallant conduct there was rewarded by promotion to the rank of lieut.col. He was present at the siege of Charleston, 1780, having meanwhile been actively engaged in various parts of Georgia and South Carolina. He was not in the city at the time of its surrender to gen. Clinton, owing to a severe accident which kept him from duty. After that disaster, Marion, then a col., raised several companies of volunteers among the country lads, or "cowboys" as the tories called them, and with this force marched to the relief of gen. Gates, at that time in North Carolina. Though poorly armed, wretchedly dressed, and at first exposed to much ridicule on that account, Marion's brigade proved of the greatest value, through their intimate knowledge of localities and the native shrewdness which earned for their leader the *sobriquet* of "Swamp Fox." From the Pedee to the Santee river, and from the sea-coast back to the central counties, the imperfectly drilled, but sturdy and enthusiastic brigade seemed to cover all points at once, and caused no little embarassment to the British forces. Among the most noted of the engagements in which Marion took part, may be named fort Moste, fort Wilson, Granby, Parker's ferry, and Eutaw. At the close of the war gen. Marion resumed his former occupation, and remained on his plantation till his death.

MARIONETTES, little jointed puppets of wood or cardboard, representing men and women, and moved by means of cords or springs by a concealed agent. They are exhibited in what are called marionette theaters, the exhibitor varying his voice, so that a sort of dramatic performance is accomplished. This entertainment was known to the Greeks, and from them passed to the Romans. In modern times, it has chiefly prevailed in France and Italy, and has there reached a very respectable degree of artistic perfection

MARION HARLAND (*pseud.*). See TERHUNE, MARY VIRGINIA.

MARIOTTE, EDME, a distinguished French natural philosopher, was b. in Burgundy during the first half of the 17th c., and was the prior of St. Martin-sous-Beaune, when the academy of sciences admitted him within its pale in 1666. His life is devoid of particular interest, having been almost wholly spent in his cabinet, among his books and instruments. He died in 1684. Mariotte's forte consisted in an extraordinary power of drawing conclusions from experiment. He repeated Pascal's experiments on gravitation, and detected some peculiarities which had escaped that ingenious philosopher; confirmed Galileo's theory of motion; enriched hydraulics with a multitude of discoveries; and finally made a thorough investigation into the subject of the conduction of water, and calculated the strength necessary for pipes under different circumstances. His collected works were published at Leyden in 1717, and at the Hague (2 vols. 4to) in 1740. His *Traité du Mouvement des Eaux* was published by La Hire (Paris, 1786, 12mo).

MARIOTTE, LAW OF, an empirical law deduced by Boyle (q.v.) and Mariotte (q.v.) from two independent series of experiments, though, strangely enough, reached by both at about the same time. It is generally expressed as follows: *The temperature remaining the same, the volume of a given mass of gas is in inverse ratio to the pressure which it sustains.* This law may be held to be substantially correct within a considerable range of pressure. But the labors of Regnault have made it evident that atmospheric air and most other gases, especially under very high pressures, are really more compressed than if they followed the law. This deviation is most marked in the case of gases capable of being liquefied, as they approach the point of liquefaction.

MARIOTTE'S INSTRUMENT, a J-shaped tube for demonstrating the law of Mariotte or Boyle, that the volume of a gas is inversely as the pressure upon it. The closed end of the J is only a few inches in length, while the open end is over 30 inches. Mercury being poured in till it is 30 in. higher in the long than in the short leg, it will be found that the air in the latter will occupy one-half its former space. If the column of mercury is 15 in. higher in the long leg, or half an atmosphere, making the pressure altogether $\frac{3}{2}$ of an atmosphere, the volume of air in the closed or short end will have $\frac{2}{3}$ of its former volume. See MARIOTTE, LAW OF, *ante*.

MARIPO'SA, a co. in e. central California; 1440 sq.m.; pop. '80, 4,339—1839 being foreign. It is drained by the Merced and Mariposa branches of the San Joaquin river; on the n. and e. it is bounded by spurs of the Sierra Nevada. In the n.e. part are the far-famed Yosemite falls and some of the grandest and most picturesque scenery of the world. More to the s. are three collections of mammoth trees, containing more than 425 specimens, of which 134 are over 15 ft. in diameter. Many of them are from 275 to 375 ft. in height and from 25 to 34 ft. in diameter. It is supposed that the age of some of these trees is at least 2,500 years. The entire country is rich in gold mines and has been the scene of very extensive mining operations. The western part is level and fertile; in 1870 there were produced over 12,000 bushels of wheat and barley; wool and hay are also staples, and sheep breeding is carried on with great success. Chief town, Mariposa

MARIS'CAL, IGNACIO, b. Mexico, 1829; called to the bar in 1849, and the next year made solicitor-general of Oaxaca. He was appointed judge of the Oaxaca court in 1859, and of the circuit court in 1860. He was secretary of legation at Washington from 1863 to 1866, and *chargé d'affaires* from 1867 to 1868. In the latter year, Juarez made him minister of justice; in 1869 he came to the United States as envoy extraordinary; and 1871–72 he was Mexican secretary of state. In 1872 he was once more appointed minister to this country, where he remained till the Diaz revolution in 1877.

MARIT'ZA (the anc. *Hebrus*), a river of European Turkey, rises in the Balkans, and flows e.s.e. through the province of eastern Roumelia to Adrianople, where it bends s., and falls into the Ægean by the gulf of Enos. It is upwards of 300 m. in length, and is navigable to Adrianople, about 100 m. from its mouth.

MARIU'POL, or MARIAMPOL, a seaport in the government of Ekaterinoslav, Russia, is situated near the place where the Kalmius falls into the sea of Azov, 60 m. w. of Taganrog. It was founded in 1779 by Greek emigrants from the Crimea, and the port was opened to foreign vessels in 1836, when 20 ships entered it; but afterwards their number increased to more than 300. The articles of export are wheat, linseed, wool, and hides from the adjacent provinces, the value being about £500,000. The imports are insignificant, ships most commonly arriving in ballast. Pop. '67, 7,760, who speak a corrupt jargon derived from the Turkish and Greek languages.

MARIUS, C., a Roman general, was born of an obscure family, at the village of Cereatæ, near Arpinum, 157 B.C. In the Numantine war (134 B.C.) he served with great distinction under the younger Scipio Africanus, who treated him with high consideration, and even indicated that he thought him a fit successor to himself. In 119 B.C. he was elected tribune of the plebs, and signalized himself by his vigorous opposition to the nobles, by whom he was intensely hated. In 114 B.C. he went to Spain as proprætor, and cleared the country of the robbers who infested it. He now married Julia, the aunt of Julius Cæsar. He accompanied Q. Cæcilius Metellus to Africa in 109 B.C., was elected consul 2 years after, and intrusted with the conduct of the Jugurthan war, which he brought to a successful close in the beginning of 106 B.C. From

this period dates the jealousy between him and L. Sulla, then his quæstor, which was ultimately productive or so many horrors. Meanwhile, an immense horde of Cimbri, Teutones, and other northern barbarians, had burst into Gaul, and repeatedly defeated the Roman forces with great slaughter. Marius was again called to the consulate for the year 104 B.C., and for the third, fourth, and fifth time in the following years, 103-101 B.C., for it was felt that he alone could save the republic. The war against the Teutones in Transalpine Gaul occupied him for more than 2 years; but he finally annihilated them in a battle of 2 days' duration at Aquæ Sextiæ, now Aix, in Provence, where 200,000—according to others, 100,000—Teutones were slain. After this he assumed the chief command in the n. of Italy against the Cimbri (q.v.), whom he also overthrow, near Vecellæ to the w. of Milan, with a like destruction (101 B.C.). The people of Rome knew no bounds to their joy. Marius was declared the savior of the state, the third founder of Rome, and his name was mentioned along with those of the gods at banquets. He was made consul for the sixth time in 100 B.C. It has often been remarked that, had he died at this period, he would have left behind him one of the greatest reputations in Roman history. When Sulla, as consul, was intrusted with the conduct of the Mithridatic war, Marius, who had long manifested an insane jealousy of his patrician rival, attempted to deprive him of the command, and a civil war began (88 B.C.). Marius was soon forced to flee, and after enduring the most frightful hardships, and making numerous hairbreadth escapes, he reached Africa, where he remained until a rising of his friends took place under Cinna. He then hurried back to Italy, and, along with Cinna, marched against Rome, which was obliged to yield. Marius was delirious in his revenge upon the aristocracy; a band of 4,000 slaves carried on the work of murder for 5 days and nights. Marius and Cinna were elected consuls together for the year 86 B.C., but the former died after he had held the office 17 days.

MARIVAUX, PIERRE CARLET DE CHAMBLAIN DE, 1688–1763; b. Paris. He wrote many comedies, mostly for the Italian theater, but they are not now performed. The best are *Le jeu de l'Amour et du Hasard*, and *Les Fausses Confidences*. He wrote also the romances *La viè de Mariane*, and *Le Paysan Parvenu*. He was elected a member of the French academy in 1743.

MAR'JORAM, *Origanum*, a genus of plants of the natural order *labiatæ*, having a 10-ribbed, 5-toothed calyx, loose spikes, and broad bracts. The species are annual, perennial, and shrubby plants, natives chiefly of the east, and of the countries bordering on the Mediterranean. They abound in a yellow essential oil—*oil of marjoram* or *oil of origanum*—which is obtained from some of the species by distillation. The COMMON MARJORAM (*O. vulgare*) is the only species found in Britain, and is not unfrequent in dry hilly and bushy places. It is a perennial plant, has a stem 1 foot high, ovate leaves, and roundish, panicled, crowded heads of purple flowers, with large bracts. It is used, as are also other species, as a seasoning in cookery, and an infusion of it is a stimulant, tonic, and remedy for nervousness. The powder is an errhine. The essential oil is used as a palliative of toothache, and is mixed with olive oil, to make a stimulating liniment, which is used as a remedy for baldness and in rheumatic complaints, and in cases of sprains and bruises.—The SWEET MARJORAM of our gardens (*O. majorana*) is an annual plant, a native of Greece and the east, with ovate grayish-green leaves, covered on both sides with a thin down, about 3 roundish heads of flowers growing close together, wrinkled bracts, and small white flowers. Its uses are similar to those of the common marjoram.

MARK, the standard weight of the money system of various countries of Europe. In Germany, during the Carlovingian period, a pound-weight (the Roman pound of 12 oz., which had been adopted as the standard of weight by the Frankish kings) of pure silver was coined into 240 pennies (*denarii*), so that a pound of money, or 240 silver pennies, actually weighed a pound. But in the course of time the coin having become debased, a new standard was found necessary, and as 240 of the pennies then commonly contained about half a Cologne pound of pure silver, it was agreed to accept this as the standard. The Cologne pound was divided into 32 oz., and the half-pound of 16 oz. had been known by the name of a *mark* as early at least as 1042; and thus the mark of 16 Cologne oz. of pure silver, equivalent to 7 oz. 14 dwt. 14 gr. English, and now coined into 14 thalers, has come to be the fundamental standard of reference. In France the mark was divided into 8 ounces=64 drams=192 deniers or pennyweights=4608 grains. The mark of Holland is the same as that of France. The pound or *livre poids de marc* used in all retail dealings in France prior to the revolution, was equivalent to 2 marks or 16 oz., or rather more than half a kilogram of modern French weight. The name mark was also given to a coin once current in England, in value 13s. 4d. The value of the Scotch mark was 13⅓d. sterling. The mark formerly in use in Hamburg was worth 1s. 2½d. sterling; the mark banco, in which accounts were kept, 1s. 5¾d. In the new uniform currency of the German empire, the unit of reckoning is the mark, approximately equal to 1s.

MARK, a German geographical term, signified primarily the *mark* of a country's limits (the *march*); and hence was applied as a designation of the border countries or districts of the German empire, conquered from neighboring nations. Thus, we read of the marks of Austria, of Northern Saxony or Brandenburg, Lausatia, Moravia,

Steiermark, etc. Tho governors intrusted with the charge of these border districts, or *marks*, were called *mark-grafs*, corresponding to the English and Scottish *wardens of the marches*. See MARQUIS.

MARK the Evangelist is probably the same who, in the Acts of the Apostles, is called John Mark. He came originally from Jerusalem, was a nephew of Barnabas, and accompanied the apostle Paul and him to Antioch, Cyprus, and Perga in Pamphylia, returned to Jerusalem, and went afterwards to Cyprus, and thence to Rome (see Acts xiii.; Col. iv. 10; 2 Tim. iv. 11). Ecclesiastical tradition speaks of a missionary expedition of Mark to Egypt and the west of Africa, of his suffering martyrdom about the year 62 or 66 (the Coptic church still consider him their founder and first bishop), and of the transmission of his corpse to Venice, which city has chosen him for its patron saint. The festival (April 25) which the Roman Catholic church holds in his honor is no older than the close of the 7th century. The canonical gospel which passes under his name is believed by some scholars to have sprung from a primitive collection of notices of the life and acts of Christ, drawn up by Mark, and to have been worked up into its present form by a later writer, who had before him the gospels of Matthew and Luke. Others, on the contrary, are of opinion that in Mark's work we have the primitive gospel from which the rest have orignated. Compare Wilke, *Der Urevangelist* (Dresd. and Leip. 1838), and Baur, *Das Marcusevangelium* (Tüb. 1851). See GOSPELS.

MARK THE EVANGELIST (*ante*), called "John whose surname was Mark," and simply "John" in the earlier parts of the Acts, but in a subsequent passage and in the epistles "Mark" only; was, perhaps, a native of Jerusalem, as his mother lived there in the first days of the church; probably became a disciple under Peter's ministry, as Peter calls him his "son;" was a companion of Paul and Barnabas as far as Perga in Pamphylia, where he left them and returned to Jerusalem. When they were about to start the second time Barnabas was resolute in his purpose to take Mark with them, but Paul thought that it was not proper to have with them one who had once before left them in the midst of the work. This difference of opinion on a matter so vital produced a sharp contention between the zealous co-laborers and friends which resulted in a division of their work, Barnabas taking Mark with him to Cyprus, and Paul, with Silas as his companion, going by land through Syria and Cilicia and thence to the west. Nearly all the information concerning Mark which the Scriptures after this supply is found in Paul's epistles in which the apostle's references to the evangelist are highly honorable to both. Paul may have thought, on subsequent reflection, that he had been hasty in his judgment, or, as is more probable, Mark's steadfastness of character may have been increased by experience and especially by the remarkable dispute and separation to which his earlier conduct had given rise. One thing is certain, that Paul's notices of him are all nobly commendatory. To Philemon he ranks him with Luke among his fellow-laborers, words which from Paul mean much; to the Colossians he sends the salutation of Marcus's sister's son to Barnabas, adding the significant parenthesis—"touching whom ye received commandments, if he come unto you, receive him;" and to Timothy among the last recorded words before his martyrdom, after telling him to use diligence in coming quickly unto him, he says, "Take Mark and bring him with yourself, for he is very profitable to me in the ministry." While the New Testament thus describes Mark as, during different portions of his life, a companion of Paul, Peter speaks of him as, probably at an intermediate time, present with him when he wrote his first epistle. By the earliest Christian writers after the apostolic age he is described as the companion of Peter rather than of Paul.

MARK, GOSPEL OF (*ante*), was received in the earliest times by the Christian churches as canonical, and as the work of Mark, under the guidance of the apostle Peter. The first written declaration to the effect, now extant, is recorded by Eusebius as quoted by Papias from John the presbyter, who probably was contemporary with John the apostle. "Mark having become Peter's interpreter wrote accurately all that he remembered, but did not record the words and deeds of Christ in order; for he was neither a hearer nor a follower of our Lord, but afterwards, as I said, became a follower of Peter, who used to adapt his instruction to the requirements of his hearers, but not as making a connected arrangement of our Lord's discourses; Mark, therefore, committed no error in writing down particulars as he remembered them, for he made one thing his object—to omit nothing of what he heard and to make no erroneous statement." Without committing ourselves to all the details of this statement, two facts we may consider as established by it: first, that Mark's gospel was in general use among the churches at the close of the 1st c.; and second, that in writing it he was in a greater or less degree under Peter's guidance, so that the second gospel may be regarded as having received his sanction to the same extent, at least, that the third was approved by Paul. While nearly all the facts which it records are given also in one or more of the other gospels, Mark's shorter gospel abounds in word-painting and precise descriptions which imply that at some stage of the narrative an eye-witness had furnished the writer with particulars which otherwise he could not have known. In one instance, while Matthew says Jesus "stretched forth his hand towards his disciples," Mark's description is, "Looking around on the circle of those who were seated about him." Where Matthew says, "He turned and said unto Peter," Mark's account is, "When he had turned about and looked on his

disciples, he rebuked Peter." In the account which three evangelists give of the rich young man who came to Jesus, only Mark adds, "Jesus looking earnestly on him loved him." In narrating the healing of the withered hand on the Sabbath day, while Luke says, "Looking around on them all," Mark says, "Looking around on them with anger, being grieved for the hardness of their hearts." Matthew describes the demoniacs of Gadara as "exceeding fierce, so that no man could pass by the way:" Luke says of one of them that "often times the spirit had caught him, and he was kept bound with chains and in fetters, and he brake the bands and was driven by the demon into the wilderness." Mark's account is the most picturesque of all, "No man could bind him, no, not with chains; because that he had been often bound with fetters and chains, and the chains had been plucked asunder by him, and the fetters broken in pieces; neither was any man strong enough to restrain him; and always, night and day, he was in the mountains, and in the tombs, crying and cutting himself with stones." Matthew and John were eye-witnesses, and had personal knowledge in other ways, of what they narrate; Luke's narrative in some parts gives information that he had probably obtained from Mary and from historical records; and when Mark relates so many particulars which imply the presence of an eye-witness from the beginning, the testimony of the early church is confirmed that that eye witness was Peter. In two instances, the probability rises almost to certainty: while Matthew gives Peter's confession in full, "Thou art the Christ, the son of the living God," followed by the benediction which it drew from Jesus, "Blessed art thou, Simon Barjona, for flesh and blood hath not revealed it unto thee, but my Father, who is in heaven," and by the remarkable promises as well as stern rebuke to which we can here only refer, Mark gives the confession only in the briefest form, "Thou art the Christ," and, omitting all intimation of benediction and promises, records the rebuke in its full force. Again, while the other gospels all speak in general terms of the cock-crowing in connection with Peter's denial, Mark specifies the crowing twice, both in the Savior's prediction and in the progress of the denial itself. In both these instances we seem warranted in saying that it was Peter, who dictated in the narrative these striking discriminations against himself.

Synopsis of Contents.—Omitting all notice of the birth and minority of Jesus and recording briefly the ministry of John the Baptist, Mark introduces Jesus at his baptism, followed by the descent of the Holy Spirit upon him, with the voice from heaven, and by the temptation in the wilderness. He then begins the account of his public ministry at the imprisonment of John; narrates the call of Simon and Andrew and of James and John; the mighty works wrought in Capernaum, followed by the circuit in Galilee; the forgiveness of the paralytic, attested by his restoration to health; the calling of Levi, followed by the entertainment at his house where many publicans and sinners were guests; the disciples in the corn-fields and the authority claimed by Jesus over the Sabbath day; the withered hand restored on the Sabbath; the multitudes drawn to Jesus from all parts of Palestine, Idumea, and Syria; the choice of the 12 apostles; the effort of the mother and brethren of Jesus to restrain him; the parable of the sower; the emblems of the lighted candle, of the seed sown, and of the grain of mustard seed; the stilling of the storm on the lake; the legion of demons that, cast out of the man, entered into the swine; the woman healed, and the daughter of Jairus raised up; the preaching at Nazareth, and unbelief of the people there; the twelve instructed, empowered, and sent forth, two by two; the perplexity of Herod, explained by a full narrative of his having put John the Baptist to death; the return and report of the twelve; the feeding of 5,000 men with five loaves, followed by the walking on the sea, and by the multitude of the sick brought together from all the region around and healed; the traditions of the elders condemned as making void the commandments of God, and counter-instructions concerning true religion given; the Syrophenician mother, at first apparently rejected in order to manifest her faith, rewarded by finding her daughter restored; the deaf stammerer cured; the 4,000 fed with seven loaves; warning against hypocrisy under the emblem of leaven; a blind man led out of the town and healed; Peter's confession of faith, followed by his presumption and stern rebuke; the disciples warned concerning future trials; the transfiguration and instructions connected with it; the dumb, deaf, and desperate demon cast out; the death of the Son of man foretold; the ambition of the disciples reproved, and humility taught under the emblem of a child; John's narrow views corrected; offenses warned against under the emblems of a hand and foot to be cut off and of an eye to be plucked out; the unlawfulness of divorce declared; little children blessed; the rich inquirer concerning eternal life; the disciples amazed and afraid; the ambitious request of James and John; Bartimæus restored to sight; the entrance into Jerusalem; the fig-tree dried up, and instructions afterwards drawn from it; the temple cleansed, and the subsequent demand for authority silenced; the hypocritical question of the Pharisees and Herodians, the scoffing question of the Sadducees, the earnest question of the scribe, and the silencing question of Jesus; warning against the scribes; the offerings of rich men and of the poor widow compared; the destruction of the temple foretold, with the attending tribulations and the sudden coming of the Son of man; the conspiring of the chief priests and scribes; the broken box of ointment, and the prediction concerning it; the covenant of Judas with the chief priests; the passover kept, the supper instituted, the betrayal and Peter's denial foretold; the conflict in Gethsemane; the betrayal, apprehension, denial by Peter, condemnation by the council, and accusa-

tion before Pilate; Barabbas released, and Jesus scourged and crucified; scenes at the cross and at the tomb; resurrection, attested by appearances to the disciples; commission and promise to the apostles; the ascension of Jesus, followed by the successful preaching of the apostles everywhere in his name. The last 12 verses of the xvi. chapter are not found in two of the oldest and best manuscripts, and their genuineness has, therefore, been questioned; but their genuineness is claimed as fully proved by the quotations from them by Irenæus and other writers of the 2d c., whose testimony is much older than any manuscript extant.

MARK ANTONY. See ANTONIUS, *ante*.

MARKET OVERT, a term in English law, used to denote an open market. If stolen goods are sold in open market without fraud on the part of the buyer, the real owner cannot reclaim them from such purchaser till he has prosecuted the thief.—In Scotland, the real owner can reclaim the goods at any time, whether in the meantime sold in open market or not.

MARKETS. See FAIRS.

MARKHAM, CLEMENTS ROBERT, b. England, 1830; educated at Westminster, and appointed a naval cadet in 1844. He was made lieut. in 1850, but left the navy the next year. He had been attached to the expedition in search of sir John Franklin in 1850–51, and from 1852 to 1854 he traveled in Peru and among the Andes. He was appointed a clerk to the board of control in 1855; introduced the cinchona plant into India in 1860; went to Ceylon and India in 1865, and in 1867 took charge of the geographical department of the India office. He went with the English expedition against Abyssinia as geographer in 1867, and was present at the capture of Magdala. He has published *Franklin's Footsteps*, 1852; *Cuzco and Lima*, 1856; *Travels in Peru and India*, 1862; *A Quichua Grammar and Dictionary*, 1863; *Spanish Irrigation*, 1867; *A History of the Abyssinian Expedition*, 1869; *A Life of the Great Lord Fairfax*, 1870; *Ollanta, a Quichua Drama*, 1871; *Memoir on the Indian Surveys*, 1871; general sketch of the *History of Persia*, 1873; *The Threshold of the Unknown Region*, 1874; *A Memoir of the Countess Chinchor*, 1875. He is secretary of the royal geographical society and editor of the *Geographical Magazine*.

MARKHAM, GERVASE, 1570–1655; b. Gotham, Nottinghamshire, England; was a capt. in the army of Charles I., and an author of great versatility, having employed his pen upon poetry, the drama, military tactics, angling, archery, etc. The most important of his works are *The Poem of Poems; Sir Richard de Grinville* (a tragedy); *The English Husbandman;* and *The Whole Art of Angling*.

MARKHAM, WILLIAM, a relative of William Penn; deputy-governor of Pennsylvania and Delaware in 1681–82; secretary of the province in 1684; deputy-governor of Delaware, 1691–93; deputy-governor of Pennsylvania under gov. Fletcher, 1693–95; and under William Penn, 1695–99.

MARKING-NUT, the fruit of *semecarpus anacardium*, a tree of the natural order *anacardiaceæ*, a native of the mountains of India. It is a large tree, with oblong leaves, and terminal panicles of flowers. The fruit is a heart-shaped nut, seated on a large swollen receptacle. The receptacle, when ripe, is roasted and eaten, and resembles a roasted apple; although, when raw, it is astringent and acrid. The nut is black, and between the two coats of its shell there is a black acrid juice, much in use for marking cotton-cloths, a mixture of quick-lime and water being applied, to prevent it from running, and to brighten the color. It is also used as an external application in rheumatism.

MARKIRCH. See SAINTE-MARIE-AUX-MINES.

MARL (Ger. *Mergel*), a mixture, naturally existing, of clay and carbonate of lime. Marls are found in very different geological formations, but everywhere seem to owe their origin to deposition by water. The name is sometimes applied to friable clays, or mixtures of clay and sand, in which there is almost no trace of lime; but the presence of a notable proportion of carbonate of lime is essential to marls, properly so called. This proportion varies from 6 to 20 per cent. Marly soils are in general of great natural fertility. Marl is very advantgeously used as a manure, acting both chemically and mechanically; but different kinds of marl are of very different value in this respect. The use of marl as a manure has been known from ancient times. An English statute of 1225 (10 Henry III.) gave every man a right to sink a marl-pit on his own ground, and there is other evidence that the application of marl to land was common in England in the 13th century. Old marl-pits are very common in some parts of England. The quicker action and greater efficiency of lime have led to its use in many cases instead of marl, although some kinds of marl are extremely useful in some soils. The bulkiness of marl confines its use to the neighborhood in which it is found.—Marl is sometimes indurated into a rock, and a slaty variety, containing much bitumen (*bituminous marl-slate*), is found in Germany and other countries.

MARL'BOROUGH, a co. in n.e. South Carolina; 500 sq.m.; pop. '80, 20,598. The surface is generally level, and there are extensive forests. The chief productions are wheat, corn, oats, rice, and cotton. Co. seat, Bennettsville.

MARLBOROUGH, a t. in Middlesex co., Mass., 32 m. w. of Boston; pop. '80, 10,126. The Boston, Clinton and Fitchburg and a branch of the Fitchburg railroads pass through it. The principal business is the manufacture of boots and shoes, which is extensive. There are 7 churches, 2 newspapers, a national and a savings bank, 3 hotels, a public library, a soldiers' monument, and a handsome town-hall.

MARLBOROUGH, an old and interesting t. of England, Wiltshire, is a municipal and parliamentary borough, pleasantly situated in the valley of the Kennet, 75 m. w.s.w. of London. It consists principally of one street of picturesque houses. The chief edifice is the "college," a handsome building occuping the site of the old castle. As early as the days of Cœur-de-Lion there was a castle at Marlborough; and a parliament, whose enactments were called the "statutes of Marlbridge," was held here in the reign of Henry III. The college was incorporated in 1845; the pupils are about 300 in number. Marlborough was formerly an important posting-station between London and Bath and Bristol. It still carries on a trade in coal, corn, and malt. Pop. '71, of parliamentary borough, which returns one member to parliament, 5,034.

MARLBOROUGH, JOHN CHURCHILL, Duke of, the greatest general and statesman of his time, was b. June 24, 1650, at Ashe, in Devonshire, of an old family impoverished by the civil wars. Without having received much education he became a page in the service of the duke of York, who gave him a commission as an ensign of guards in his 16th year. He was present at the relief of Tangiers, and a number of engagements with the Moors, and after his return to England rose to the rank of capt. in a regiment which was sent to the Netherlands to the support of the French. In the campaign from 1672 to 1677 his brilliant courage and ability gained him the praise of the celebrated Turenne. On the conclusion of the war by the peace of Nimeguen, Churchill, now a col., returned to England. His advancement had been obtained not merely on account of his own merit, but through the influence of his sister Arabella, mistress of the duke of York. His prosperity was afterwards still further secured by his marriage with Sarah Jennings, a lady as remarkable for her talents and imperious disposition as for her beauty. When James II. ascended the throne, Churchill was made baron of Sundridge, and was raised to the military rank of general. He took an active part in suppressing Monmouth's rebellion, but on the landing of the prince of Orange he passed over to the side of the invader very unscrupulously. He was rewarded by being made earl of Marlborough. He aided in reducing Ireland to subjection, and, having received from William III. the command of the troops employed against France in the Netherlands, displayed great ability as a gen. in the campaigns of 1689, 1690, and 1691. But in 1692 he fell into disfavor with the king and was dismissed from all his offices, and shortly after he was even thrown into the Tower for a few days on the charge of maintaining treasonable correspondence with the exiled king. On the commencement of the war of the Spanish succession he was intrusted with the command of the British army in the Netherlands. The death of William, and the accession of Anne to the throne in March, 1702, made Marlborough virtually regent, although without the title. His wife governed the queen, and he himself directed the minister Godolphin, whose son had married his daughter. A constant succession of victories strengthened his political power. In the campaign of 1702 he drove the French out of Spanish Guelders, in reward for which service the queen raised him to the rank of duke; and in 1703 he campaigned again in the Low Countries. In 1704 he went to the support of the emperor in Germany, and joined prince Eugene of Savoy; in July, 1704, he stormed the French and Bavarian lines at Donauwörth; and on Aug. 13 overthrew a stronger French and Bavarian army in the memorable and decisive battle of Blenheim. The parliament bestowed on him the estate of Woodstock, and the queen caused Blenheim palace to be built for him, though it had to be finished at his own expense. In 1705 Marlborough was made a prince of the empire. During the year 1705 Marlborough was chiefly occupied with diplomatic negotiations, but in 1706 he resumed that career of victory by which Louis XIV. was so completely humbled. In May of that year the battle of Ramillies was fought, which compelled the French to evacuate the whole of Spanish Flanders. In the summer of 1708 an attempt made by the French, under Vendome, to recover Flanders, brought on an engagement at Oudenarde, July 11, which resulted in the total defeat of the French. On Sept. 11, 1709, he fought the bloody and unprofitable battle of Malplaquet; in 1710, his final campaign, he took town after town from the French. Meanwhile, however, important events took place at the British court: the queen shook off the tyranny of the duchess of Marlborough, which had become intolerable to her; Godolphin and Sunderland ceased to be ministers, and the earl of Oxford and the tories came into power. Marlborough was accused of having embezzled the public money, and on Jan. 1, 1712, he was deprived of his offices, but the charge against him was not prosecuted. On the accession of George I. he was treated with distinction and made capt.gen. and master of the ordnance. But on May 28, 1716, he had a stroke of apoplexy. This, though it slightly impaired his speech, did not prevent him from continuing to sit in parliament and attending to his other duties till six months before his death, which happened on June 16, 1722. He left an immense fortune. Marlborough was unquestionably guilty of political dissimulation, was inordinately fond of money, and may have been parsi-

monious. But his character had many elements of singular excellence. He was generous in action, gentle in temper, a devoted husband, and a pious Christian.

His wife, Sarah Jennings, was b. on May 29, 1660, and when about 12 years of age came into the service of the duchess of York, and became the chosen and most intimate friend of the princess Anne, over whom, after her accession to the throne, she exercised the influence due to a superior and extremely active mind. Her power was almost boundless; the whig ministry depended upon her support, and she disposed of places and offices at her pleasure, and is even said to have accumulated money by the sale of them. Her rule became, however, at last intolerable to the queen, in whose favor her own cousin, lady Masham, whom she herself had brought to court, supplanted her. She retired from the court in January, 1711. She long survived her husband, living in complete retirement, and died on Oct. 29, 1744, leaving a fortune of £3,000,000 sterling. The only son of the duke and duchess of Marlborough died young, and the title has been inherited by the descendants of one of their daughters.

MARLINE-SPIKE, a ponderous iron pin, with a large head and taper point, used on shipboard for separating the strands of rope preparatory to splicing or knotting; also employed as a lever in tightening rigging, etc.

MARLOW, GREAT. See GREAT MARLOW.

MARLOWE, CHRISTOPHER, familiarly *Kit*, an English dramatic writer, was b., it is supposed, in 1565. But little is known of the events of his life. He studied at Corpus Christi college, Cambridge, and took the degree of master of arts in 1587. After leaving the university, he came up to London, and wrote for the stage. His chief works are *Dr. Faustus, Edward II., Tamburlaine the Great*, and two cantos of *Hero and Leander*, a narrative poem which was afterwards completed by Chapman. He appears to have led a reckless life; and on June 1, 1593, he perished in a tavern brawl, it is supposed by the hand of a jealous rival.

Of all the dramatic writers before Shakespeare, he was the greatest genius; indeed, his *Edward II.* may be considered a foreshadow of Shakespeare's historical dramas. His "mighty line" has been the subject of much critical laudation. His imaginative force and splendor are at their best in *Faustus;* his delicacy and sweetness in *Hero and Leander*. An edition of his works, with a life and a literary-historical introduction, was published by Dyce in 1850.

MAR'MALADE (Port. *marmelada*, from *marmelo*, a quince; which, again, is from Mid. Lat. *malomellum*, Gr. *melimelon*, honey-apple or sweet apple) is a semi-liquid preserve, made by boiling the pulp of thick-rinded fruits, such as oranges, pine-apples, quinces, etc., with portions of the rind. The most common kind of marmalade is made from the bitter or Seville oranges, the common or sweet sorts being considered inferior for this purpose, though also occasionally used. The mode of preparing it is generally as follows: the rind is boiled by itself, and the white woolly coating on the interior being then removed, the rind is cut up into thin strips, and boiled along with the expressed juice of the pulp and a quantity of sugar equal in weight to the other ingredients. After the mixture has attained the proper consistence, it is treated in a similar manner to jam, jelly, and other preserves. A species of marmalade is commonly made in France from apricots, peaches, plums, pears, etc.

MARMANDE, an old t. of France, in the department of Lot-et-Garonne, on the right bank of the Garonne, 50 m. above Bordeaux. An important general trade is carried on with Bordeaux, with which Marmande is in daily communication by steamboat. Pop. '76, 6,037, who manufacture hats, woolen stuffs, brandy, etc.

MAR'MAROS, the name of a co. in n.e. Hungary, bounded on the n. by Gallicia, e. by Gallicia and Bukowina, and s. by Transylvania. It is the third county in size in Hungary; 3,998 sq.m.; pop. '70, 220,506. The population is made up of Wallachs, Jews, Magyars, Germans, and Ruthenians, the latter being fully half the whole number. The prevailing church is the united Greek. It is a mountainous region, being crossed and intersected by the Carpathian chain, many of whose peaks reach a great height. It is a rich mineral country, containing iron, lead, coal, and gold; there are also great salt mines, alabaster, marble, crystals, and diamonds. Mineral springs are frequent, the land is heavily timbered, chiefly with oak; and there are vast numbers of horses and sheep. The river Theiss waters this county, and its valley is fertile, and produces grain, fruits, and wine; elsewhere maize is the only important food product.

MARMIER, XAVIER, b. in Pontarlier, France, 1809. After journeys through Europe he translated Krummacher's stories from the German into French, and their success enabled him to make further travels and to become director of the *Revue Germanique*. In 1835 he was attached to the scientific voyage of the *Recherche* to the Arctic sea. During the voyage he acquired a knowledge of the Danish, Swedish, and Finnish languages; and on his return in 1839 was made professor of foreign literature at Rennes, and two years later was given a sinecure under the minister of public instruction. In 1842 he visited Russia; traversed the Indies, passing from the Danube to the Nile; in Syria in 1845; Algeria in 1846; North America in 1848; South America, 1849, etc.; everywhere studying the languages, idioms, and literature of the country. His works are numerous,

and valued as a fund of information for students of the languages and manners of all the people among whom he has been—for he has written continuously as he traveled.

MARMONT, AUGUSTE FRÉDÉRIC LOUIS VIESSE DE, duke of Ragusa and marshal of France, was b. July 20, 1774, at Châtillon-sur-Seine, entered the army at an early age, served as a brig.-gen. in Egypt, returned with Bonaparte to France, supported him in the revolution of the 18th Brumaire, and afterwards continued in active military service. Having defended the Ragusan territory against the Russians and Montenegrins, he was made duke of Ragusa. He joined the great army in 1809, the day before the battle of Wagram, was intrusted with the pursuit of the enemy, won the battle of Znaym, and was made a marshal. He was thereafter for eighteen months governor of the Illyrian provinces; and in 1811 succeeded Massena in the chief command in Portugal, where he assumed the offensive, caused the siege of Badajoz to be raised, and kept Wellington in check for fifteen months. A wound compelled him to retire to France. In 1813 he commanded a *corps d'armée*, and fought at Lützen, Bautzen, and Dresden. He maintained the contest with great spirit in France in the beginning of 1814; and it was not until further resistance was hopeless that he concluded a truce with Barclay de Tolly, on which Napoleon found himself compelled to abdicate. The Bourbons loaded Marmont with honors. On the return of Napoleon from Elba, he was obliged to flee. After the second restoration, he spent much of his time in agricultural pursuits, till the revolution of 1830, when, at the head of a body of troops, he endeavored to reduce Paris to submission, and finally retreating with 6,000 Swiss, and a few battalions that had continued faithful to Charles X., conducted him across the frontier. From that time he resided chiefly in Vienna. In 1852 he engaged in an effort for the fusion of the French legitimists and Orleanists, but died at Venice on Mar. 2 of that year. He was the last survivor of the marshals of the first French empire.

MARMONTEL, JEAN FRANÇOIS, an elegant French writer, b. of an obscure family at Bort, in the Limousin, July 11, 1723. He studied for the church, but turned aside to literature, and after obtaining some reputation in Toulouse as a poet, he went to Paris on an invitation from Voltaire in 1746. Here he wrote tragedies and operas without any great success, but was fortunate enough to get a secretaryship at Versailles, through the influence of Mme. Pompadour, in 1753. Afterwards, he received a more lucrative appointment, the *Mercure* being intrusted to his charge. His *Contes Moraux* (2 vols., Par. 1761), part of which originally appeared in the *Mercure*, have been translated into many languages, but are in some measure liable to the charge of monotony. He wrote other works, the most celebrated of which is his *Bélisaire*, a political romance, containing a chapter on *toleration*, which excited the most furious hostility on the part of the doctors of the Sorbonne. The book was condemned as "heretical and blasphemous." The clergy declaimed against it from the pulpits; the city was in a ferment; even the wise Turgot was borne away by the current. Pamphlets, epigrams, caricatures appeared in great numbers. There was a dead set-to between the philosophers and wits on the one hand, and the theologians on the other; but the latter were defeated, and Marmontel was named historiographer of France. In 1787 appeared his *Elémens de Littérature*, consisting of his contributions to the *Encyclopédia*, in which he had charge of the departments of poetry and general literature. It is really his best book, and the one on which his reputation most securely rests. After the revolution, he retired to the village of Abloville, near Evreux, where he died, Dec. 31, 1799. An edition of his *Œuvres Complètes* was published by himself in 17 vols.; another 18 vols. (Par. 1818); a third, 7 vols. (Par. 1819–20).

MAR'MORA, THE SEA OF, the *Propontis* of the ancients, a small sea between European and Asiatic Turkey, communicating with the Ægean sea by the strait of the Dardanelles (anciently *Hellespont*), and with the Black sea by the strait of Constantinople (anciently *Bosporus*). It is of an oval form, and about 135 m. in length by 45 in breadth, but has besides a large gulf, the gulf of Isnikmid or Ismid, which extends about 30 m. eastwards into Asia. The depth is great. There is a current from the Bosporus through it and the Hellespont to the Archipelago; but its navigation is by no means difficult. It contains many islands, of which the largest is Marmora or Marmara, famous for its quarries of marble and alabaster. The scenery around the sea of Marmora is soft and beautiful.

MAR'MOSET, a name often given to a number of small and beautiful species of American monkeys of the genera *hapale* and *jacchus*, also called OUISTITI, and sometimes also to species of the genus *midas* of naturalists. They are all distinguished from the other American monkeys by the smaller number of their grinders, resembling in this the monkeys of the old world, also by the sharpness and crookedness of their nails. They depart from the true quadrumanous character in having the thumb not opposable. The tail is very long, and thickly covered with hair, but not prehensile. They exhibit a very affectionate disposition; but unhappily all of them prove very delicate when removed from a warm climate. The name Marmoset is sometimes restricted to the species also called the STRIATED MONKEY, or STRIATED OUISTITI (*hapale jacchus*, or *jacchus vulgaris*), a native of Guiana and Brazil, a species often brought to Europe, and a favorite pet whenever it can be obtained. It is about seven or eight inches long, exclusive of the tail, which measures a foot. Its fur is long and soft, of a fine dark gray or reddish-yellow color, banded with black; a long tuft of white hairs on each side of the black head.

MARMOT, *Arctomys*, a genus of rodents, usually ranked among the *muridæ*, but regarded as forming a connecting link between that family and *sciuridæ;* resembling squirrels in their dentition, although in their form and habits they more resemble rats and mice. They have two incisors and two premolars in each jaw, four molars on each side above, and three below. The COMMON MARMOT, or ALPINE MARMOT (*A. alpinus*), is a native of the Alps, the Pyrenees, and the more northern mountains of Europe, up to the limits of perpetual snow. It is not a native of Britain. It is about the size of a rabbit, grayish yellow, brown towards the head. It feeds on roots, leaves, insects, etc. It is gregarious, and often lives in large societies. It digs large burrows with several chambers and two entrances, generally on the slopes of the mountains, where the marmots may be seen sporting and basking in the sunshine during the fine weather of summer. They spend the winter in their burrows, in one chamber of which is a store of dried grass; but the greater part of the winter is passed in torpidity. The alpine marmot is easily tamed. The QUEBEC MARMOT (*A. empetra*), found in Canada and the more northern parts of America, in woody districts, is a burrowing but not a gregarious animal.

MARNE, a river of France, the *Matrŏna* of the ancients, the most considerable tributary of the Seine, on the right. It rises in the plateau of Langres, flows through the departments of Haute-Marne, Marne, Aisne, and Seine-et-Marne, in a course at first to the n.w., and then to the w., with many windings; passes Chaumont, Joinville, St. Dizier, Vitry, Châlons, Epernay, Château-Thierry, and Meaux; and joins the Seine at Charenton, about four miles above Paris. Its length is about 205 m.; and it is navigable for 140 miles. It is rather a rapid stream, and in most places with a wide bed. The commerce carried on upon this river has been extended by means of canals, of which the most important is one completed in 1851, connecting it with the Rhine.

MARNE, an inland department in the n.e. of France, formed out of the old province of Champagne, is traversed by the river Marne, and extends southward from the frontier department of Ardennes. Area, 2,021,488 English acres, of which 1,519,320 acres are cultivable, and 45,704 are in vineyards. Pop. '76, 407,780. The soil is very fertile in the s., but chalky and arid in the north. It is in the dry and chalky soil of the n. of this department where the best varieties of the famous champagne wine (q.v.) are grown. In 1875, 15,318,345 bottles of champagne were exported. Of wines of all kinds, about 15,400,000 gallons are produced annually. The rearing of a Spanish breed of sheep is a chief industry, and woolen manufactures are largely carried on. The department is divided into the 5 arrondisements of Châlons-sur-Marne, Epernay, Reims, Sainte-Ménéhould, Vitry-le-François. Capital, Châlons-sur-Marne.

MARNE, HAUTE, an inland department in the n.e. of France, s.e. of the department of Marne. Area, 1,545,460 acres; pop. '76, 252,448. The surface is generally hilly, and is mountainous in the s. and east. More than one-half of it is cultivable, and about one-third is in forests. The principal rivers are the Marne, with its tributaries, and the Meuse. About 13,000,000 gallons of wine of an ordinary quality are produced. The department is rich in iron ore; there are numerous furnaces, and the production of iron is the principal branch of industry. There are three arrondissements, of Chaumont, Langres, and Vassy; capital, Chaumont-en-Bassigny.

MARNIX, PHILIP VAN. See ALDEGONDE, SAINTE.

MAROCCO. See MOROCCO.

MAROCHETTI, CARLO, Baron, chevalier of the legion of honor, an Italian sculptor of merit, b. at Turin in 1805. Having completed his primary studies at the lyceum Napoléon, he entered Bosio's study. On the completion of a tour through Italy he took up his abode in France in 1827, and carried off a medal the same year for his beautiful statue of "A Young Girl sporting with a Dog." In 1831 he exhibited the "Fallen Angel." On the outbreak of the Paris revolution of 1848, Marochetti repaired to London, where he continued to reside, having met with splendid encouragement both from the public and a host of royal and noble patrons. Among his best works are an equestrian statue of Emmanuel Philibert, executed gratuitously for the city of Turin; the tomb of Bellini, in Père la Chaise; the grand altar in the Madeleine at Paris; statues of the emperor, the duke of Orleans, and queen Victoria; the colossal figure of Richard cœur-de-lion, exhibited at the portal of the Crystal palace. One of his last works was a statue of lord Clyde in Waterloo place, London. He died in 1867.

MAR'ONITES, a Christian tribe of Syria, of very ancient origin, regarding which considerable controversy has arisen. The most probable account represents them as descendants of a remnant of the Monothelite sect (see MONOTHELISM) who, fleeing from the repressive measures of the emperor Anastasius II,, in the early part of the 8th c., settled on the slopes of the Lebanon, their chief seats being around the monastery of Maron, a saint of the 5th c., whose life is found in Theodoret's *Religious Histories* (iii. p. 1222). The emigrants are said to have elected as their chief and patriarch a monk of the same name, with the title of patriarch of Antioch, and, throughout the political vicissitudes of the succeeding centuries, to have maintained themselves in a certain independence among the Moslem conquerors. In the 12th c., on the establishment of the Latin kingdom of Jerusalem, the Maronites abandoned their distinctive monothelite opinions,

and recognized the authority of the Roman church. Again, in the council of Florence, 1445, they entered into a formal act of union with Rome. In 1584 a college was founded in Rome for the education of the Maronite clergy; and in 1736 they formally subscribed the decrees of the council of Trent. Nevertheless, although united with Rome, they are permitted to retain their distinctive national rites and usages. They administer communion in both kinds; they use the ancient Syriac language in their liturgy; their clergy, if married before ordination, are permitted to retain their wives; and they have many festivals and saints not recognized in the Roman calendar. The Maronites at present are about 150,000 in number, distributed into 150 parishes. Their patriarch is still styled patriarch of Antioch, and resides in the convent of Canobin on the Lebanon. He acknowledges the supremacy of the pope, and is bound to lay before him every tenth year a report of the state of his patriarchate. Under him are 17 bishops, to whom are subject the officiating clergy of the 150 districts alluded to above. The revenues of all orders of ecclesiastics, however, are very narrow, and the inferior clergy live in great measure by the labor of their hands. Very many convents for both sexes are spread over the country, containing, in the whole, from 20,000 to 25,000 members, who all wear a distinctive costume, but follow the rule of St. Anthony. The chief seat of the Maronites is the district called Kesrawan, on the western declivity of Mount Lebanon; but they are to be found scattered over the whole territory of the Lebanon, and in all the towns and larger villages towards the n. in the direction of Aleppo, and southwards as far as Nazareth. Their political constitution is a kind of military republic, regulated for the most part by ancient usages and by unwritten, but well-recognized laws. Like the Arabs of Syria, they have a political hierarchy, partly hereditary, partly elective. The chief administration is vested in four superior sheiks, who possess a sort of patriarchal authority, and under these are subordinate chiefs, with whom, as in the feudal system, the people hold a military tenure. They retain even still a custom similar to that of the Sardinian *vendetta*, by which the kindred of the slain are bound to avenge his death. The relations of the Maronites with the Druses have been already detailed. See DRUSES By an arrangement adopted since the recent sanguinary conflicts, both populations alike are subject to one governor, who is appointed by the porte as governor of the Lebanon.

MAROONS, a name given in Jamaica and Dutch Guiana to runaway negro slaves. The term was first applied to those slaves who were deserted by their masters, the Spaniards, when the British conquered Jamaica (1655), and who took refuge in the uplands, where for 140 years they maintained a constant warfare with the British colonists; but in 1795 they were subdued, and a portion of them removed to Nova Scotia, and afterwards to Sierra Leone. The remnant fraternized with their manumitted brethren in 1834–35. The Maroons of Dutch Guiana form a number of small independent communities.

MAROS' RIVER, in the Austro-Hungarian empire, takes its rise in the Carpathian mountains of Transylvania, near Mt. Magos; flowing s.w. through Transylvania it enters Hungary, where it forms the n. boundary of the Banat or military frontiers. It empties into the Theiss; length 350 miles. On the left side its principal branches are the Nyarad, Kokel, Sebes, and Strehl; on the right, the Aranyos. In its upper portion it flows through a country rich in almost all the metals and minerals; its lower course is through fertile plains. It is navigable as far as Karlsburg, which is the principal city upon its banks.

MAROS-VASARHE'LY, a market t. of Austria, in Transylvania, in a fruitful district, on the Maros, 55 m. n.n.e. of Hermanstadt. It contains a strong castle, a beautiful Gothic church (Reformed), and a public library of 60,000 vols. Tobacco, wine, and fruit are extensively grown. Pop. '69, 12,678.

MAROT, CLÉMENT, 1495–1544; b. in Cahors, France; studied law, found it repugnant, attracted the attention of Marguerite de Valois, and was made valet de chambre to Francis I. His father was court poet of Anne of Bretagne, and had also been valet de chambre of the same king. Marot's wit, poetic faculty and charming manners secured the favor of the monarch, to whom he had dedicated a poem, the *Temple of Cupid.* At the battle of Pavia, in Italy, he was taken prisoner with Francis I. Returning to France not long after, he was imprisoned for supposed sympathy with the reformers in religion, suggested by his poem *L'Enfer.* Released by his friend, the bishop of Chartres, his pen became more lively and caustic than before, as will be seen by the following verse from *L'Épitre aux Dames de Paris:*

L'oisiveté des moines et cagots,
Je la diraes, mais je crains les fagots;
Et des abus dont l'église est fourée,
J'eu parlerais, mais garde la bourée.

He was again imprisoned (1530), but obtained the favor of the king by a poem and was again released. Dreading further imprisonment, he sought refuge, in 1535, at the court of the queen of Navarre. In 1536 we find him at Ferrare, Italy, at the court of the duchesse Rénée, where he formed a friendship with Calvin. Pope Paul III. ordered the duchess not to harbor those pestilent men. They left together and went to Venice. But he was no suitable companion for Calvin; Marot was simply a free-thinker. Their bond of friendship was hatred of the corruptions of the church. Calvin was building a

faith hedged round about with the same dogmatism that he was combating. Marot would soon have lampooned that as caustically as he had the Roman church had Calvin not been a fellow-sufferer from persecution. Marot reappeared at court between 1538 and 1545, but was considered a dangerous heretic; yet he obtained employment in translating the Psalms of David from the Hebrew into French rhythm. The church condemned it, the king interdicted its publication; but it circulated nevertheless, and became one of the favorite studies of the Jansenists and Calvinists. The psalms were set to music by Goudimel, and sung in the meetings of the Protestants. Marot felt himself in danger in Paris, and joined Calvin in Geneva. But he found the austerities of the latter and his followers as repugnant to him as the weaknesses of the monks. Accused of playing backgammon and other frivolities, he found it more pleasant to leave the city than to reside in it, and sought refuge in Turin, where he died poor at the age of 50. La Harpe says of him: "The name of Marot marks the first epoch really notable in the history of our poetry." Another critic considers him remarkable chiefly as being the first to mold French to a really polished and melodious verse. His works form a singular variety of tracts, songs, ballads, letters, cock-and-bull stories, madrigals, epigrams, epitaphs. He was the Tom Moore of his day—precise in the expression of his thought, and at once witty and graceful. The *Roman de la Rose*, *Frère Lubin*, *Frère Thibeaud*, *A Madame d'Alençon*, and the translations of the Psalms, are a few of his numerous works. His letters, *Épitres*, are considered his finest work.

MAROZIA, a Roman lady of noble birth, but of infamous reputation in the scandalous chronicles of her age, daughter of the equally notorious Theodora, was b. in the close of the 9th century. On the dissolution of all the moral ties of public and private life which the war of factions occasioned in Rome in the 10th c., Marozia, by her beauty and her intrigues, contrived to exercise great influence. She was married three times, and, if we may credit the narrative of Luitprand, had skill and address enough to procure the deposition and death of the pope, John X., and the elevation of her son—the fruit, it is alleged, of adulterous intercourse—to the pontificate, under the name of John XI. This, however, rests on the testimony of Luitprand, who wrote some time after the period, and whose authority is considered more than doubtful not merely by Muratori, but even by so critical and unbiased a writer as Dr. Pertz. Marozia's latter years brought on her the punishment of her crimes. She died in prison at Rome in 938.

MARQUE, Letters of. See Letters of Marque.

MARQUESAS ISLES are, properly speaking, the southern group of the Mendaña archipelago, in Polynesia, the northern group bearing the name of the Washington islands; but the name is also applied to the whole archipelago. The Marquesas isles, in lat. 7° 30′ to 10 °30′ s., long. 138° to 140° 20′ w., were discovered by Mendaña de Neyra, a Spanish navigator, in 1596; the Washington isles were discovered in 1791, by Ingraham, an American. Area of the group as under the French protectorate, 500 English sq.m.; pop. 10,000. The Marquesas isles were named after the viceroy of Peru, Marquesas de Mendoza. In 1842 the Marquesas isles submitted to the French, and they are now governed by independent chiefs, under the protectorate of France.

MARQUETRY (Fr. *marqueterie*), the art of inlaying wood with wood of other colors, or with various other materials, as metal, ivory, shell, etc.

MARQUETRY (*ante*). See Buhl-work; Inlaying; Mosaic; *ante*.

MARQUETTE, a co. in n. Michigan, intersected in the e. and n.e. by the Marquette, Houghton and Ontonagon railroad, and the Chicago and Northwestern railway; about 3,425 sq.m.; pop. '80, 25,393—11,868 of American birth, 154 colored. In the n.e. it forms part of the shore of lake Superior, and it is drained by numerous rivers and creeks, the Escanaba and Michigamme being the most important, and has lake Michigamme in the north. Pine forests cover a large extent of the surface, which is generally level. Its agricultural products are potatoes, butter, maple-sugar, and oats. Live stock is raised to some extent. Its mineral products are granite, iron ore (red oxide), lead, and limestone. Iron is found in great abundance, especially in Iron mountain, a ridge rising in the n.e. section to the height of 900 ft. above the level of lake Superior. Under the most favorable circumstances the yield is about 200,000 tons from this mine annually. Mining is the chief industry. Its manufactories consist of furnaces for the manufacture of pig-iron, mining powder, charcoal, and nitro-glycerine. There are lumber and lath works and machine shops. Seat of justice, Marquette.

MARQUETTE, a co. of s. central Wisconsin; 490 sq.m.; pop. '80, 8,907. Surface level and traversed by Fox river; soil fertile; corn, wheat, and wool are the staple products. Capital, Montello.

MARQUETTE, a city in Michigan, a shipping point for the coal-mines of Marquette co. and depot of supplies, by the s. shore of lake Superior; on a bluff 25 ft. in height; pop. '70, 5,242. It has an excellent harbor with convenient piers reaching far into the lake. It is 500 m. from Detroit by water, and 430 m. by rail from Chicago. It is 95 m. s.e. of Houghton, and is the e. terminus of the Marquette, Houghton and Ontonagon railroad, besides having communication with the large cities by steamer. It is lighted with gas, has several machine-shops, foundries, rolling-mills, and blast furnaces. It has a fine opera-house; 3 banks, with an aggregate capital of $700,000, 2 of them national;

6 churches, 3 public halls, a park of forest trees, good schools with expensive edifices, a newspaper, a well-organized fire department, and a public library. Its water supply is brought from the lake by the Holly system. Roofing-slate and brown stone are quarried.

MARQUETTE, JACQUES, 1637–75, b. France; came to Canada as a Jesuit missionary in 1666, and after spending a year and a half in the valley of the Three Rivers learning the Indian languages of several of the Algonquin tribes, was assigned to the Mohawk mission; but before going his direction was changed, and he was sent to lake Superior, where he founded the mission of the *Sault Sainte Marie* in 1668. In 1669 he was sent to La Pointe, among the Ottawas and Hurons. The Sioux broke up the mission and dispersed the Hurons, whom he followed to Mackinaw and the mission St. Ignatius, on the north shore, where he built a chapel in 1671. The following year, writing with great show of piety and holy zeal to father Dablon, the head of the order in Montreal, he congratulated himself with what he had accomplished, and expressed himself "ready to seek new nations toward the South sea who are still unknown to us, and to teach them of our great God," etc. He had heard in many ways from the Indians of the existence of a great river to the westward, whose course was south, and which they called by its present name, Mississippi. It was imagined by the missionaries to empty into the South sea or Pacific. Marquette was something of a surveyor and ambitious of explorations. As early as 1669, while at La Pointe, he had this voyage of discovery in his mind. The sagacious governor Frontenac was made familiar with the rumors of the great river, and while the unfortunate La Salle had been turned from his projected expedition in the same direction, Louis Joliet was commissioned by the governor to undertake the tour of discovery, and Jacques Marquette was instructed by the Jesuits to accompany him. The shores of lakes Huron, Superior, and Michigan had already been explored and rudely mapped. May 17, 1673, they started from Mackinaw in two canoes, with five French *voyageurs*, and proceeded to Green bay of lake Michigan, where the mission of St. François Xavier had been established in 1669. They reached the mouth of Fox river, ascended it to the rapids, which they passed by portage, and then to its source, where they found a village of Miami Indians. There procuring two fresh Indian guides, they carried their canoes over to the waters of the *Mescousin* or Wisconsin river. Down this they floated by day, till on June 17 they entered the Mississippi. They descended it for 300 m. without seeing a human being, when they perceived a trail on the e. side of the river, and discovered a village of Illinois Indians, by whom they were well treated. When they reached the junction of the Missouri, Marquette described it as a river whose rapids were violent, and in whose muddy stream the floating timber trunks and branches of trees swept by with a force that inspired fear. He proceeded down to the mouth of the Ohio. Still further down they discovered iron on the river bank, and were now greatly tormented by mosquitoes. They met Indians on this part of the river who had guns, hatchets, knives, hoes, and glass bottles for their gunpowder; and were informed that they were within ten days' journey of the sea; that they purchased goods that came from people of the east; and that those people dressed like themselves, and had images and beads. They found numerous and more civilized Indians as they proceeded, and when arrived at the mouth of the Arkansas, were received with much comfort and state in the Indian villages. Having arrived at lat. 34°, they feared to go further lest they should fall into the hands of the Spaniards, and on July 17 started to ascend the river. On reaching the Illinois they ascended it, instead of going farther up to the mouth of the Wisconsin. From the head of this stream they are supposed to have made the portage to lake Michigan at or near Chicago; and were greatly impressed with the beauty and fertility of the country. After an absence of 4 months, and a voyage in canoes of 2,550 m., they were back at Green bay the latter part of September, where Marquette remained, and Joliet proceeded to report to the governor at Montreal. On Oct. 25, 1674, Marquette with a party, in ten canoes, set out to form a mission settlement in Illinois. From the head of Green bay, at Sturgeon cove, they carried their canoes through the forest to the shore of lake Michigan, thence skirted the western shore of the lake to the Chicago river, where, enfeebled by sickness, he stopped, built a log hut, and spent the winter. On Mar. 30, 1675, their hut was inundated by a freshet in the river, and they gathered their necessaries to pursue the journey to the Illinois, which they made by the portage to the Des Plaines river, and finally arrived at the Indian town of Kaskaskia, where he says "he was received like an angel from heaven." After Easter he returned to lake Michigan, on which he embarked with two companions and explored in their canoe the eastern shore of lake Michigan. They had proceeded as far as a small stream, south of the one which now bears his name, when his strength failed, and he died peacefully, and was buried. The party continued their journey to Michilimackinac, or Mackinaw. In 1676 his bones were dug up by a party of Ottawas, who washed, dried, and boxed them carefully in birch bark, and forming a procession of 30 canoes, bore them with funereal chants to the mission of St. Ignace, north of Mackinaw, where the relics were received with solemn ceremonies, and buried beneath the floor of the chapel of the mission.

MARQUEZ, LEONARDO, b. Mexico, 1818; prominent during the war between Mexico and the United States, 1845–48, and in 1847 was active in the defense of the valley of

Mexico. In 1849 the successful revolutionary movement of Santa Anna was supported by Marquez, who headed a rising in Guanajuato. In reward for this service, Santa Anna, on receiving the presidency, promoted him to high command. Alvarez and Comonfort found a bitter and persistent antagonist in Marquez, who conducted against them a fierce guerilla warfare during 1856–57, and who, during the next three years, sustained Miramon and Zuloaga in their conflict with Juarez. This conflict he continued to wage independently after Miramon had retired from the field, and until the occurrence of the French intervention in 1861. He supported Maximilian in his progress through Mexico, and on the latter assuming the crown of the new empire, Marquez was appointed minister of the new government to Constantinople. From this mission he returned in 1866, and witnessed the downfall of the empire, partaking of the last struggles of Maximilian, and commanding the defense of the city of Mexico against the operations of Porfirio Diaz. On the surrender of the capital he fled to Havana, and has since made that city his residence. The career of Marquez, though brave and adventurous, was stained by unnecessary cruelty. In 1859 he gained the bloody victory of Tacubaya, and signalized his success by the execution, not only of prisoners of war, but of non-combatants, an act which gave him the significant name of "the tiger of Tacubaya." Other instances of a similar sanguinary temper occur in the execution, by his orders, of the prime minister Ocampo, and generals Valle and Degollado, who were his prisoners. In view of these facts, the established government of Mexico, after the downfall of Maximilian, set a price upon the head of Marquez; and on the occasion of the general amnesty granted in 1870, he was expressly excluded by name. It is due to him to state that he has made published statements denying the charges of cruelty which had been brought against him.

MAR'QUIS, or MARQUESS, the degree of nobility which in the peerage of England ranks next to duke. Marquises were originally commanders on the borders or frontiers of countries, or on the sea-coast, which they were bound to protect. In England the title of marquis was used in this sense as early as the reign of Henry III., when there were marquises or lords-marchers of the borders of Scotland and Wales; and the foreign equivalent of *markgraf* was common on the continent. The first English marquis in the modern sense was Robert de Vere, earl of Oxford, who was created marquis of Dublin by Richard II., to the no small offense of the earls who had to yield him precedence. The oldest existing marquisate is that of Winchester, created by Edward VI. in 1551. The title was first introduced into Scotland in 1599, when the marquises of Huntly and Hamilton were created.

The coronet of a marquis, as worn in the United Kingdom, is a circle of gold, with four strawberry leaves (or oak leaves), and as many pearls alternating with them, and placed on pyramidal points of the same height with the leaves. The mantle is scarlet, with three and a half doublings of ermine. A marquis is styled "the most honorable;" his wife is a marchioness; his eldest son takes by courtesy the next lower title in the peerage, except where that is identical with the title of the marquisate, in which case he must take the next lower still, as in the case of the marquis and earl of Salisbury, whose eldest son bears the courtesy-title of viscount Cranborne. The younger sons of a marquis are styled "lord," and daughters "lady," with the addition of Christian name and surname.

MARRIAGE, the union of a man and woman in the legal relation of husband and wife. This in one form or another is the oldest institution of society and the source of its most ancient laws. Society, indeed, could not long exist without some rules being imposed by necessity for the appropriation of men and women to one another, securing them in the enjoyment of one another's society, and defining their obligations to their children. According to the law or practice of the greater part of the civilized world, one man marries one woman at a time. The Mormon heresy on this subject is now being suppressed by force. But this familiar system of monogamy is a comparatively recent development of marriage. A great diversity of opinion exists as to the particular form of primitive marriage. It is conceivable that there may have been many forms. Polygynia and polyandria—one man with many wives, one wife with many husbands; these have certainly existed. By the most recent writer on the subject (Morgan, *Systems of Consanguinity and Affinity*, 1871; and *Ancient Society*, 1877) it is asserted that intercourse was originally promiscuous. This negation of marriage is vehemently disputed. Morgan also affirms a primitive custom of intermarriage between brothers and sisters; the consanguine family of the Malay civilization; and a custom of intermarriage of several sisters with each other's husbands, and of several brothers with each other's wives. This custom is said to result in the formation of a *gens*, governed in its marriage relations by the principle of exogamy—viz., selection of wives outside the *gens*. After this comes the marriage of single pairs with or without exclusive habitation. The patriarchal family was largely monogamous; and true monogamy does not appear before the rise of private property, lineal succession, and slavery. (See on this subject, McLennan, *Primitive Marriage*, 2d ed.; Tylor, *Early History of Mankind;* Lubbock's *Origin of Civilization;* Bachofen, *Das Mutterrecht.*) The primitive ceremonies of marriage are of immense number, and some of striking beauty. Those which have left the most distinct survivals in modern custom are sale and capture. As regards Christian Europe, in 1085 Hilde-

brand declared marriage to be a sacrament of the church; and at the reformation Calvin declared it to be an institution of God. The school of Grotius described it as a contract of partnership. Throughout Christendom marriage is generally accompanied by a religious ceremony. In the eye of the law, even where the intervention of a priest is on public grounds declared essential, marriage is a contract, but differs from other contracts because its incidents are fixed by public law, and because it affects the *status* of the contracting parties. The varieties of marriage as a modern legal institution are well summarized in Bergson's introduction to *Concordance entre les Codes Civils* (Paris, 1856). We can describe only the modes of constituting marriage in use in England, Scotland, and Ireland. For rights connected with the dissolution of marriage, see DIVORCE. For the effects of marriage on property, see HUSBAND AND WIFE.

England.—To insure deliberation and to preserve indisputable evidence of so important a fact, the English law makes certain forms essential to marriage. A breach of the contract to marry gives rise to an action of damages (though this remedy is being gradually condemned by public opinion); but marriage itself will not be set aside and treated as null merely because either party procured it by fraudulent representations. Marriage cannot be rescinded by either party or both at pleasure, though that effect is brought about in another way by certain kinds of misconduct, whether studied or not, of either party. See DIVORCE, JUDICIAL SEPARATION. Another circumstance in which marriage differs from other contracts is, that it cannot be entered into in a moment, but certain preliminary notices must be given, and forms gone through. From the year 1753 (the date of lord Hardwicke's act, 26 Geo. II. c. 33) to 1836 (the date of lord Russell's act, 6 and 7 Will. IV. c. 85, which first authorized marriages in registered buildings and before a registrar), the power of solemnizing lawful marriages, when the parties were neither Quakers nor Jews, was conferred by the legislature on the clergy of the established church only. Since the latter date persons have the option of two forms of contracting marriage: it may be with or without a religious ceremony; and if with a religious ceremony, it may be either in the established church or in a dissenting chapel. If the marriage is to take place in an established church, there must be publication of bans of marriage for three preceding successive Sundays, either after the second lesson or during the communion office; but a marriage license obtained from the ordinary of the district, or a special license from the archbishop, will dispense with bans; fifteen days' previous residence in the parish by one of the parties being necessary. A registrar's certificate, obtained on 7 days' residence and 21 days' notice, will also dispense with bans, but an established church clergyman is not bound to marry on this. The marriage must take place in the church, the marriage service of the church of England being read over, and this must be done in canonical hours—i.e., between 8 and 12 A.M., in presence of two witnesses. If the marriage is celebrated in a dissenting chapel (and for that purpose such chapel must be duly licensed and registered under lord Russell's act), a certificate or license must be got after notice from the registrar; and there must be present the registrar of the district as one of the witnesses, except in Quaker and Jewish marriages. If the marriage is not with any religious ceremony, it must take place in the office of the superintendent-registrar, and in presence of witnesses; both parties in the presence of witnesses there exchanging a declaration that they take each other for man and wife. The canonical hours must be attended to in all cases. The omission of any of these requisites with the knowledge of the parties, makes a marriage void. It is felony to celebrate a marriage in a private house, unless by special license from the archbishop. And in all cases the fact of the marriage must be entered in a church, and also in a civil, register; the latter being ultimately filed and kept in Somerset house, London, where a copy of the certificate of registration can be had for a small sum. The guilt of perjury is incurred by making or signing a false declaration on giving notice to the officer. When one of the parties to a marriage celebrated under the act 6 and 7 Will. IV. c. 85, resides in Scotland or Ireland, a certificate by the session-clerk in Scotland of due proclamation of bans there, or a certificate from an Irish registrar, is equivalent to a certificate by an English district registrar. In the case of the marriage of an infant—i.e., a person under 21 years of age—evidence of the consent of parents or guardians has to be produced to the registrar or other officer. If one of the parties applying for license or bans fraudulently represent that such consent has been obtained, he or she forfeits all benefit arising from the property of the infant; which will be ordered by the court of chancery to be settled on the innocent party, or, if both parties concurred in the fraud, on the children of the marriage. The absence of consent of parents or guardians, however, does not make a marriage null. It may sometimes happen that persons go through the form of marriage, and yet are not married; as where one of the parties is already married, the spouse being alive. In such case it is quite immaterial whether the party so remarrying is really ignorant that his or her spouse is alive, provided such is the fact; for though, after seven years, if nothing has been heard of one of two married parties, the other will escape the penalties of bigamy on marrying again, yet it depends entirely on whether the first spouse is really dead at the time, whether the second marriage is valid. Other instances where the marriage is void, though the ceremony is complete, are where the persons are related to each other within the forbidden degrees of consanguinity and affinity; where either of them is under age, or of unsound mind, or physically disqualified. In the last case the nullity must be declared in the divorce court. As regards

members of the royal family (except the issue of princesses married into foreign families), they must either get the sovereign's consent, or give 12 months' notice to the privy council, subject to objection from both houses of parliament, in terms of 12 Geo. III. c. 11. Marriage betwixt a divorced party and the adulterer is lawful in England. But no clergyman of the established church can be compelled to marry any person whose previous marriage has been dissolved on the ground of adultery.

The marriages of Quakers and Jews were excepted from the acts prior to 6 and 7 Will. IV. c. 85, and are now subject to a peculiar legislation. They need not be in a registered building, and the registering officer of the Quakers, or the secretary of the synagogue, is authorized to be present instead of the registrar. (For mixed Quaker marriages, see 23 and 24 Vict., 18 and 35 Vict. c. 10.)

The marriages of European British subjects in India are regulated by the imperial act 14 and 15 Vict. c. 40, and the Indian marriage act of 1865. As regards the colonies, the chief imperial statute is 28 and 29 Vict. c. 64, which, however, leaves the matter of registration to local acts. Generally, marriages celebrated in foreign countries according to the *lex loci* are recognized as valid if the parties are capable of marriage. Marriages abroad within the lines of the British army are sanctioned by 4 Geo. IV. c. 91; and marriages may take place before British consuls under 12 and 13 Vict. c. 68, and 31 and 32 Vict. c. 61.

Considerable changes have been made in the details of the marriage law of Ireland by the acts of 1870 and 1871, viz., 33 and 34 Vict. c. 110, and 34 and 35 Vict. c. 49. The first of these acts was required partly as a readjustment after the disestablishment of the Anglican church in Ireland; but it also provides a form of license to be issued by Episcopalian bishops or their nominees, and by the heads of the non-Episcopalian Protestant communions; and it contains important provisions relating to the legalization of marriages of different religious persuasions. Such marriages must be performed by a clergyman in a building set apart for the celebration of divine service, with open doors, between 8 A.M. and 2 P.M., and in the presence of two or more credible witnesses. A certificate from the local registrar is also required under pain of nullity. The act of 1871 gives the form of certificate required for a marriage by special license; it enables Roman Catholic bishops to issue licenses for mixed marriages, and it extends to such marriages the power of licensing previously given to other church officials.

Scotland.—In Scotland, the principle of the civil law, *consensus non concubitus facit matrimonium*, has been adopted; and this consent can be proved either by a regular ceremony *in facie ecclesiæ* publicly recorded, or in three other modes known to the law. The chief impediments to this consent are nonage, insanity, impotency, relationship within the prohibited degrees, subsisting marriage, adultery in the case of the adulterers, and, since lord Brougham's act (19 and 20 Vict. c. 96), non-residence in Scotland. There are many notorious cases of sham marriages, where a form has been gone through to prevent scandal or by way of joke, but no serious intention to marry was present. Also, if force has been used; or where an error as to the woman's chastity has been caused by her misrepresentation or concealment; or a mistake of personal identity occurs; or where a fraudulent conspiracy has been formed, the marriage is null. In Scotland, as elsewhere, down to the council of Trent, a sacerdotal benediction was essential to marriage; and the Scotch clandestine or inorderly marriage was one celebrated with an improper religious ceremony, and quite different from the irregular marriage (without religious ceremony) punishable under 19 and 20 Vict. c. 96. By 10 Anne. c. 7, Episcopalian ministers, and by 4 and 5 Will. IV. c. 28, all other priests or ministers not of the established church were permitted to celebrate marriage. This had previously been the privilege of the established church. Proclamation of bans takes place in the parish church, whether civil or *quoad sacra*, in which at least one of the parties has resided for six weeks. Irregular marriages are constituted by consent, and proved by a written or verbal declaration of interchange of consent *per verba de præsenti;* or by a promise to marry, on the faith of which intercourse has followed (these facts, according to one opinion, requiring to be proved by a decree of declarator); or by cohabitation and habit and repute. The consent which makes an irregular marriage may, of course, be given before the registrar, or may be proved by a conviction before the justices of the peace, under 17 and 18 Vict. c. 80, the registration act. An order appointing registration can be obtained on proof before the sheriff, under lord Brougham's act, 19 and 20 Vict. c. 96.

Much discontent was felt in Scotland with the corrupt practice in proclaiming bans. The proclamation was generally not made on three successive Sundays, as required by law, but thrice on one Sunday; and for this illegality the session-clerks were in the habit of charging higher fees than would otherwise have been exigible according to custom. Indeed, the fees charged varied largely over the country, and in some places were so exorbitant that, in the opinion of many authorities, they were a direct occasion to concubinage and irregular marriage. The dissenters too, rightly or wrongly, felt aggrieved by the necessity of having recourse to the parish church. To remedy this state of things, the marriage notice (Scotland) act, 1878, was passed, "to encourage the celebration of regular marriages." According to this act, where two persons residing in Scotland wish to marry regularly, but without bans, each of them gives notice, in a form provided by the act, to the registrar of the parish or district in which he or she has lived for fifteen days immediately before; and this notice is entered by the registrar in "the marriage

notice book," which anybody can inspect for one shilling; and for seven consecutive days after receiving the notice, the registrar is bound to keep posted up in a conspicuous and accessible place on the door or outer wall of his office, a public notice of the marriage, in another form provided by the act. Where both persons live in the same parish or district, one notice is enough. After the seven days, if no objection to the marriage appears on the face of the notice, and if no objection is stated by a third perty in a writing subscribed by him and supported by a declaration taken before the registrar, the latter must grant to the person giving notice a certificate of due publication; and this certificate is sufficient authority for a minister, clergyman, or priest to celebrate a regular marriage, just as if it were a certificate of proclamation of bans. The certificate must be used within three months of its date; and no minister of the church of Scotland is obliged to celebrate a marriage not preceded by proclamation of bans. One party to the marriage may produce a registrar's certificate, and the other a certificate of bans. The act imposes severe penalties on those who celebrate a marriage with a religious ceremony but without a certificate of the one kind or the other; on registrars granting certificates not authorized by the act; and on persons guilty of willful falsehood in a notice, a declaration, or an objection. The registrars keep a supply of forms for use under the act. As regards the treatment of objections made to the registrar; where these relate merely to some formality or statutory requirement, the registrar must make inquiry, and report to the sheriff, who may direct the notice to be either amended or canceled; but where the objection relates to a legal incapacity to marry or a legal impediment to marriage, the registrar is forbidden to issue a certificate until he sees the judgment of a court of law disposing of the objection.

Ireland.—As regards marriages celebrated in what was once the established church of Ireland, not much difference existed between England and Ireland, except that bans, being under the canons and rubrics of the church, were more easily proclaimed, and the use of licenses (which were much cheaper) was more common. Roman Catholic marriages were under the common law, and if celebrated by a priest were valid without bans, license, notice, residence, or consent. Mr. Monsell's act, 26 and 27 Vict. c. 90, directs them to be registered. Presbyterian marriages were regulated by the Irish marriage act, 7 and 8 Vict. c. 81, passed in consequence of the famous case of *Queen and Millis*, invalidating all celebration of mixed marriages by Protestant non-conformists. This act and the act of 26 and 27 Vict. c. 27, relating to the registration of places of public worship for the solemnization of marriage, are extended by the act 36 Vict. c. 16 to meet the case of communities "who are not Roman Catholic, and who do not describe themselves as Protestant." Other non-conformist marriages were by registrar's certificate or license. For a long time, mixed marriages by the Catholic clergy were forbidden by 19 Geo. II. c. 13.

MARRIAGE (*ante*). The common statement that marriage is a contract is open to many objections. It is argued that the stipulations are *in futuro*, and that there can be no conditions or limitations attached, and that, while the law of contract supposes all parties to stand on an equal footing, the law of marriage, like that of other *status*, presupposes that they are not equal, and has even been called the "law of unequals." Undoubtedly the best statement is that the term marriage is used in law, as, indeed, in common language, in two entirely distinct senses: first, to denote the contract itself; and, secondly, to designate the resulting condition or *status*. The relations of the parties to one another in this *status*, their mutual rights, duties, and restraints, and, more especially, the powers of the wife as to tenure and disposition of property, are treated under the heads of HUSBAND and WIFE; and DIVORCE, *ante*. The question now in hand is, What constitutes a legal marriage in the United States? In the first place, it may be stated, generally, that the law on this subject is, in this country, far more liberal in relation to ceremonies and formalities than in any other civilized land, with the single exception of Scotland. The statutes of the various states, it is true, differ greatly, and in some instances the discrepancies amount to positive contradiction; but the general tendency is in the direction indicated. In defense of this tendency it may be said that public policy favors marriage, that liberal construction often protects an innocent but ignorant party from the consequences of imposition, and that it tends to discourage vice. On the other hand, it might be urged that to accept very slight evidence as proof of a valid marriage is to encourage thoughtless and improvident union, to open a door for the legal sanction of vicious entanglements, and that the most sacred engagement of life cannot be surrounded by too many safeguards.

To constitute a valid marriage there must first be legal capacity; which, in most states, is held to exist in the case of males at the age of 14, and of females at 12. There must next be free consent and mutual agreement. But not even in Scotland does consent alone complete the contract. The wording of the law is: "*consensus et concubitus*," in other words, there must be cohabitation. Yet the *essence* of the contract is consent, and many rulings indicate that in the United States subsequent cohabitation is not a requisite. The consent must be *in verba præsenti*, in words of the present and not the future. Here arises a remarkable discrepancy in the method by which the courts in different states have arrived at the same result—the enforcement of loosely constructed marriages. Some few, following the law of Scotland, have declared that an agreement

in futuro followed by cohabitation was sufficient, while most maintain the opposite doctrine. Thus, in a case where the parties agreed to live as if man and wife, and to allow their fellow-boarders to suppose them so, and that after the occurrence of certain events they should in fact be married, it has been held in one state that this was a good contract, while in another state the opposite was held in a very similar state of facts. But besides consent, the statutes of all the states impose regulations as to license, religious ceremony, consent of parents if under a certain age, and others, many and various. Are these requirements of such a nature as to render a contract entered into without compliance with their provisions void or voidable? In the earlier cases great reluctance was shown to admit that such a contract could stand. In *Milford vs. Worcester*, 7 Metcalf, 48, it was held by the courts of Massachusetts that a marriage without statutory compliance was absolutely void. So Parsons, in his work on contracts, says that he knows of no case in which a mere agreement to marry, with no formality and no compliance with any law or usage regulating marriage, is actually permitted to give both parties and their children all the rights, and lay them under all the obligations and liabilities, civil and criminal, of a legal marriage. But he reluctantly admits that recent decisions tend very strongly that way. And in not very recent cases it has been held, both in Pennsylvania and in New Hampshire, that a marriage contract in words of the present is valid without forms or witnesses; while the Illinois supreme court has gone so far as to say that, where there has been cohabitation, the presumption of marriage exists until overthrown by direct evidence—a very doubtful doctrine. See also *Fenton vs. Reed*, 4 Johnson, 54. In New York the rulings have been very strong in support of recognizing such marriages, and it may be regarded as now well-established law that the non-compliance with statutory provisions does not render a *bona-fide* contract void, and can be dealt with only by inflicting the prescribed penalties of fine or imprisonment on the negligent parties; though in certain cases it may render the marriage *voidable*. It is not necessary that both parties should know that the agreement to be legal man and wife is good in law. The actual agreement—which of course must be to assume the legal relations of man and wife, not simply to live together—is enough; and if, while one of the parties is acting in good faith, the other believes that he can legally renounce the contract, he is not to benefit by his treacherous conduct. As to whether such a contract as has been described has actually been completed, the question is purely one of evidence; and it is admitted on all sides in this country that circumstantial evidence, such as cohabitation, general repute, reception as man and wife by the family and by neighbors and friends, may be admitted, and their weight passed upon by the jury.

It is in general true that the *lex loci* applies to marriage contracts; that is, if a marriage is good where it is contracted, it is good anywhere; and it has even been held that where, in Massachusetts, a white man and negro woman went to Rhode Island for the ceremony, in order to avoid a prohibitory statute of the first state, their marriage could not be treated as void in Massachusetts. But suppose the laws of Utah allow polygamy, is it to be recognized as valid elsewhere? or, if the people of one state regard as incestuous what is allowed in another, are the people of the first to have no protection from the presence of what they consider a disgraceful example? Probably the courts in such cases would hold that *lex loci* may be overruled by public policy, but the decisions on the point are not yet clear. A peculiar class of cases of recent date, in this country, arises from the laws of Southern states in regard to the condition and marriage of colored persons, and especially their intermarriage with whites. It is held in *Frusher vs. The State*, 3 Texas Court of Appeals, 263, that such intermarriage is illegal; in North Carolina a marriage of the kind made in another state, but without intent to avoid the law, was ruled good; and by similar reasoning it has been decided that, in a case where the intent to avoid the law was obvious, the contract was void. But the main point of interest as to these cases is whether such laws are constitutional, or whether they conflict with the 15th amendment. On this point, we believe, there is as yet no decision by the supreme court.

Here, as in England, the common-law principles as to contracts in restraint of marriage and marriage-brokerage contracts are in full force. Thus, a bond by a widow not to marry again is absolutely void; and, in general, the law regards with extreme disfavor any undertakings or contracts as regards marriage which might have been the result of coercion or fraud.

MARRIED WOMAN. See HUSBAND AND WIFE.

MARROW is a substance of low specific gravity, filling the cells and cavities of the bones of mammals. There are two varieties, which are known as *watery marrow* and *oily marrow*. In some of the short bones, as the bodies of the vertebræ and the sternum, the marrow has a reddish color, and is found on analysis to contain 75 per cent of water, the remainder consisting of albuminous and fibrinous matter with salts and a trace of oil. In the long bones of a healthy adult mammal, the marrow occurs as a yellow, oily fluid, contained in vescicles like those of common fat, which are imbedded in the interspaces of the medullary membrane, which is a highly vascular membrane lining the interior of the bones. This marrow consists of 96 per cent of oil, and 4 of water, connective tissue, and vessels.

The oily matter of the marrow is composed of the same materials as common fat, with the oleine (or fluid portion) in greater abundance. Being of low specific gravity, it

is well suited to fill the cavities of the bones, and forms an advantageous substitute for the bony matter which preceded it in the young animal. Its special uses are not very clearly known, but the fact that it loses much of its oil, when the general nutritive powers fail, or when certain forms of disease attack the bone, shows that it plays some definite part in the economy.

MARROW CONTROVERSY, one of the most strenuous and memorable struggles in the religious history of Scotland, took its name from a book entitled the *Marrow of Modern Divinity*, written by a Puritan soldier in the time of the commonwealth. The highly "evangelical" character of this work, and especially its doctrine of the free grace of God in the redemption of sinners, had made it a great favorite with the few zealous and pious ministers then to be found in the church of Scotland, and in 1718 an edition was published by the rev. James Hog of Carnock, followed, in 1719, by an explanatory pamphlet. The general assembly of the same year appointed a commission to look after books and pamphlets promoting such opinions as are contained in the *Marrow*, and to summon before them the authors and recommenders of such publications. The committee, after an examination, drew up a report, which was presented to the next assembly, that of 1720, and the result was the formal condemnation of the doctrines of the *Marrow*, a prohibition to teach or preach them for the future, and an exhortation (strong, but vain) to the people of Scotland not to read them. This act of the assembly was immediately brought by the celebrated Thomas Boston (q.v.) before the presbytery of Selkirk, who laid it before the synod of Merse and Teviotdale. The "evangelical" ministers in the church, few in number, but supported by a very considerable amount of popular sympathy (for the *Marrow* by this time ranked next to the Bible in the regards of the religious portion of the Scottish peasantry), resolved to present a representation to the next general assembly (1721), complaining of the late act, and vindicating the "truths" which it condemned. Twelve ministers signed the representation—James Hog, Thomas Boston, John Bonnar, James Kid, Gabriel Wilson, Ebenezer Erskine, Ralph Erskine, James Wardlaw, James Bathgate, Henry Davidson, William Hunter, and John Williamson. These are the famous "Marrow-men"—also known as the "twelve brethren" and the "representers"—whose names were long held in great veneration by the lovers of "evangelical" religion. A commission of the assembly of 1721 was appointed to deal with the twelve, and a series of questions was put to them, to which answers were drawn up by Ebenezer Erskine and Gabriel Wilson. These replies did not prove quite satisfactory, and the "Marrow-men" were called before the bar of the assembly (1722), and solemnly rebuked. Nevertheless, as the assembly was not supported in the position it had assumed by the religious sentiment of the nation, no further steps were taken in the matter, and thus the victory virtually lay with the evangelical recusants. It was, however, substantially the same controversy—though it did not go by the name—which, 11 years later, resulted in the deposition of Ebenezer Erskine, and the origination of the "secession" body. See BOSTON, THOMAS, and ERSKINE, EBENEZER.

MARRUCINI, an ancient people in central Italy, on a narrow tract of land along the right bank of the river Aternus. Their territory extended from the Apennines to the Adriatic; between the Vestini on the n. and the Frentani on the s.; and between the Peligni and the Adriatic on the e. and west. They were an independent nation, said to be descended from the Sabines, and generally were in alliance with their neighbors, the Marsi and Peligni. They entered into alliance with the Romans in 304 B.C., but rebelled at the beginning of the social war. Their only place of importance was Teste, now Chieti, on the right bank of the Aternus, now the Pescara.

MARRUM. See AMMOPHILA.

MARRYAT, FREDERICK, an English sailor and novelist, was the son of a West India merchant, and was b. in London, July 10, 1792. On leaving school he entered the navy as a midshipman under lord Cochrane. In 1812 he attained his lieutenancy, and was made commander in 1815. While afloat he saw much active service, established a high character for bravery, and was made a C.B. in June, 1825. About 1830 he wrote his first novel, entitled *Frank Mildmay*, and this was followed in rapid succession by those graphic and humorous pictures of sea-life which have taken a permanent place in every English circulating library. He died at Langham, in Norfolk, Aug. 2, 1848. He was married, and left six children. Marryat's works are too numerous to be enumerated here; the most popular are perhaps *Midshipman Easy; Peter Simple; Jacob Faithful;* and *Japhet in Search of a Father.* His fictions are full of adventure, and are characterized by a certain rude breadth of humor. Since Smollett's time, no novels have provoked so much laughter as his.

MARS, a contraction of MAVERS or MAVORS; in the Oscan or Sabine language, MAMERS, the name of an ancient Italian divinity, identified by the Græcizing Romans with the Thracian-Hellenic *Ares.* It will, however, be better to treat the two conceptions separately.

The Roman Mars, who as a war-god is surnamed *Gradivus* (= *grandis divus*, the great god), also bore the surname of *Silvanus*, and appears to have been originally an agricultural deity; and propitiatory offerings were presented to him as the guardian of fields and flocks; but as the fierce shepherds who founded the city of Rome were even more

addicted to martial than to pastoral pursuits, one can easily understand how *Mars Silvanus* should have, in the course of time, become the "god of war." Mars, who was a perfect personification of the stern, relentless, and even cruel valor of the old Romans, was held in the highest honor. He ranked next to Jupiter; like him he bore the venerable epithet of *Father* (Mars-*piter*); he was one of the three tutelary divinities of the city, to each of whom Numa appointed a flamen; nay, he was said to be the father of Romulus himself (by Rhea Silvia, the priestess of Vesta), and was thus believed to be the real progenitor of the Roman people. He had a sanctuary on the Quirinal; and the hill received its name from his surname, *Quirinus*, the most probable meaning of which is *the spear-armed*. It was under this designation that he was invoked as the protector of the *Quirites* (citizens)—in other words, of the state. The principal animals sacred to him were the wolf and the horse. He had many temples at Rome, the most celebrated of which was that outside the *Porta Capena*, on the Appian road. The *Campus Martius*, where the Romans practiced athletic and military exercises, was named after him; so was the month of March (*Martius*), the first month of the Roman year. The *Ludi Martiales* (games held in his honor) were celebrated every year in the circus Aug. 1.

ARES, the Greek god of war, was the son of Zeus and Hera, and the favorite of Aphrodite, who bore him several children. He is represented in Greek poetry as a most sanguinary divinity, delighting in war for its own sake, and in the destruction of men. Before him into battle goes his sister *Eris* (Strife); along with him are his sons and companions, *Deimos* (Horror) and *Phobos* (Fear). He does not always adhere to the same side, like the great *Athena*, but inspires now the one, now the other. He is not always victorious. Diomede wounded him, and in his fall, says Homer, "he roared like nine or ten thousand warriors together." Such a representation would have been deemed blasphemous by the ancient Roman mind, imbued as it was with a solemn Hebrew-like reverence for its gods. The worship of Ares was never very prevalent in Greece; it is believed to have been imported from Thrace. There, and in Scythia, were its great seats, and there Ares was believed to have his chief home. He had, however, temples or shrines at Athens, Sparta, Olympia, and other places. On statues and reliefs, he is represented as a person of great muscular power, and either naked or clothed with the chlamys.

MARS, one of the planets. See SOLAR SYSTEM.

MARS, ANNE FRANÇOISE HYPPOLYTE BOUTET, 1779–1847; b. France; called Mademoiselle; one of the most illustrious French actresses, daughter of an excellent actor named Monvel and an actress *Mlle.* Mars-Boutet, both of Paris. At the age of 14 she appeared at the comédie Française in personations of ingenuous childhood, under the care of Mlle. Contat, the prima donna of the theater. These simple parts continued for many years to be her rôle, and it was not till she had reached her 24th year that her first grand success was obtained in *L'Abbé de l'Epée* in the part of the deaf and dumb girl. From that time forward, through a period of nearly 40 years, she acted through the whole range of dramatic art with a fullness of talent that never failed to present with delicacy, power, and good taste each new character in which she appeared. Beginning her career as a child in the stormy days of the revolution, a mother at 16 achieving her first great triumphs in the early days of the first empire, rendering more admirably than her predecessors the heroines of the classic drama of the great poets of France before the revolution, and finally taking up one after another the works of succeeding generations of dramatists and poets, Victor Hugo, Alfred de Vigny, Scribe, Dumas, and breathing into their heroines the glow of her own talents. She prolonged her apparent youth, beauty, and power almost to her dying day. The habit of playing ingenuous characters in her youth, and many years of practice in simple rôles before assuming leading parts, seem to have ripened those delicate and superb coquetries which beauty and genius combined find latitude to exhibit on the stage. Beautiful in face, imposing in form, suave in manner, tasteful in dress, with a voice melodiously modulated at will to suit every emotion, she was in appearance the ideal actress. Her *liaison* with the emperor Napoleon seems to have made a real impression on her heart, for on the accession of Louis XVIII. she refused to use the customary ejaculation of *vive le roi*, and had some trouble with the theatrical manager about it; but the king covered the misunderstanding by settling upon her 30,000 livres. She was not married, and her private life was that of the corrupt society of her time. Although a generous giver, she left at her death an estate of 800,000 francs.

MARSA'LA, a large fortified seaport on the w. coast of Sicily, 16 m. s.s.w. of Trapani. Pop. of commune '72, 24,202. It stands in a fruitful and well-cultivated district, and is a regularly built and pleasant town, with a college, a cathedral, a gymnasium, and several conventual establishments. It occupies the site of Lilybæum, the ancient capital of the Carthaginian settlements in Sicily, and was selected by Garibaldi as the landing-point of his volunteers in his famous Sicilian campaign, 1860. It obtained its present name from the Arabs, who, when they held Sicily, esteemed this part so highly that they called it *Marsa Alla*, "Port of God." Its harbor is encumbered with sand, but its celebrated wines form an export trade of great importance, chiefly since 1802, when they were adopted by lord Nelson for the use of the British fleet. Thirty thousand pipes of Marsala wine, which resembles sherry, are annually manufactured, two-thirds being exported. Marsala has also a large export trade in grain, oil, salt, and soda.

MARSCH'NER, HEINRICH, 1795–1861; b. Germany; a self-educated composer. His opera, *Der Kyffhäuserberg*, appeared in 1816; *Heinrich IV. und Aubigné*, in 1819; *Der Vampyr*, his best work, in 1828. In the meantime he had become director of the opera at Dresden, a post which he gave up in 1830, when he was appointed chapel-master to the king of Hanover. There he composed *Das Schloss am Aetna* and *Hans Heiling*, and set to music Mosenthal's *Goldsmith of Ulm*.

MARSDEN, SAMUEL, 1764–1838; b. England; educated at the free grammar-school at Hull. He began life as a tradesman at Leeds. He joined the Methodists, and belonged to them for some time; but, desiring to obtain a collegiate education, he entered the English church; studied at St. Joseph's college, Cambridge; and before taking his degree was offered the chaplaincy to New South Wales. He was ordained in 1793, and in 1794 sailed as chaplain to the new penal colony at Paramatta, near Sydney, Australia. Seven years previously, the first convict ship had been sent out, yet up to this time religious instruction was unknown. For soldiers, settlers, convicts, and all, Marsden was the only Christian teacher. Receiving a grant of land and 13 convicts to till it as part payment for his services, he made it the model farm in New South Wales, and devoted the profits from it to the support of schools and missions. A mutinous spirit showing itself among the convicts, Marsden sailed for England, mainly for the purpose of obtaining permission for the friends of the convicts to accompany them to the penal colony. This was refused, but his proposal that the convicts should be taught trades was well received. Having had some intercourse with the Maoris of New Zealand, and found them to be superior to the Australian native, he endeavored, while in England, to obtain funds for the formation of a mission among them, and missionaries to accompany him. He endeavored to obtain help from the church missionary society. No clergyman could be found to undertake the mission, but two laymen, William Hall and John King, consented to go as pioneers, and accompanied Marsden to Australia, Aug., 1809. They were soon followed by Thomas Kendall. Marsden having vainly endeavored to get aid in fitting out a missionary ship to transfer these lay missionaries to their field of labor, purchased a small vessel at his own expense, which was named the *Active*. He sailed with them, and was kindly welcomed by the natives. He employed these teachers in laying the foundations of a Christian civilization. He frequently visited them, and in his fourth visit took with him the rev. Henry Williams, who afterwards became bishop of a Maori district. He procured reinforcements for the mission from the English and Wesleyan churches, induced the natives to adopt a fixed form of government, provided for the preparation of a grammar and dictionary of the Maori language, and lived to see the people Christianized. In his 72d year of age he made his seventh and last visit, and was greeted everywhere as the friend of the Maori. He found Sunday generally observed, polygamy and cannibalism fast diminishing, and the people in many respects greatly improved.

MARSDEN, WILLIAM, D.C.L., son of a merchant; 1754–1836; b. Dublin. In 1771 he was appointed to the civil service of the East India company at Bencoolen, Sumatra; became secretary to the government, and acquired a thorough knowledge of the Malay language; returned to England in 1779 with a pension, and devoted himself to literature, and published a *History of Sumatra*. In 1795 he was made second secretary, and afterwards first secretary, to the admiralty. In 1807 resigning, he retired to private life and study. In 1812 he published his *Grammar and Dictionary of the Malay Language*, and in 1817 a translation of *Marco Polo*. In 1831 he voluntarily resigned his pension. In 1834 he presented to the British museum his rich collection of oriental coins, and his library of books and oriental MSS. to King's college. He published also *Numismata Orientalia* (eastern coins); *Catalogue of Dictionaries, Vocabularies, Grammars, and Alphabets;* and some papers on the language, manners, and antiquities of the east in the *Philosophical Transactions* and the *Archæologia*.

MARSEILLAISE, the name by which the grand song of the first French revolution is known. The circumstances which led to its composition are as follows. In the beginning of 1792, when a column of volunteers was about to leave Strasbourg, the mayor of the city, who gave a banquet on the occasion, asked an officer of artillery named Rouget de Lisle, to compose a song in their honor. His request was complied with, and the result was the *Marsellaise*—both verse and music being the work of a single night! De Lisle entitled the piece *Chant de Guerre de l'Armée du Rhin*. Next day it was sung with that rapturous enthusiasm that only Frenchmen can exhibit, and instead of 600 volunteers, 1000 marched out of Strasbourg. Soon from the whole army of the north resounded the thrilling and fiery words *aux armes, aux armes;* nevertheless the song was still unknown at Paris, and was first introduced there by Barbaroux when he summoned the youth of Marseilles to the capital in July, 1792. It was received with transports by the Parisians, who—ignorant of its real authorship—named it *Hymne des Marseillais*, which name it has ever since borne.

MARSEILLES, the first seaport of France and of the Mediterranean, in the department of Bouches-du-Rhone, is situated on the gulf of Lyons, 410 m. in a direct line s.s.e. of Paris, and in lat. 43° 17′ n., long. 5° 22′ east. Marseilles is a military place of the fourth class, and is defended by a citadel and other works; the roads are protected by the fortified isles of If (crowned by a castle, once a state-prison), Pomegue, and Ratonneau

Its harbor is formed by an inlet of the sea running eastward into the heart of the city, and from its extent (nearly 70 acres), and its great natural and artificial advantages, it is capable of accommodating 1200 vessels. The new harbor consists of a series of docks or *bassins* (*de la Joliette, de l'Entrepôt, Napoléon, Impérial*), upwards of a mile long, with an area of about 100 acres. Alongside the bassins de l'Entrepôt and Napoléon are the bonded warehouses, erected at an outlay of a million sterling, and the finest of the kind in Europe. From the margin of the old harbor the ground rises on all sides, forming a kind of amphitheater; and beyond the city proper the encircling hills, covered with vineyards and olive-gardens, are dotted with white country-houses. Immediately north of the harbor is the old town, with its narrow streets lined with high closely piled houses; but through it a wide avenue, with branches, has recently been driven. South of the old harbor is the church of St. Victor, the most ancient of Marseilles; and farther to the south rises the rocky hill of *Notre Dame de la Garde*, with its church, held in the highest veneration by the sailors of the Mediterranean. At the foot of the hill is the wide promenade, Cours Bonaparte. Other fine promenades are Le Cours and Le Prado. The principal public buildings are the hôtel de ville, the museum, the public library with its 78,000 vols., and the exchange. The *cafés* and shops of Marseilles rival those of Paris in splendor. Marseilles is the first commercial emporium of France. It has many soap-works, iron manufactories, sugar refineries, etc. The large vessels and steamers annually entering its harbor number upwards of 8,600, and measure above 2,600,000 tons. Marseilles is directly connected by rail with Lyons, Toulouse, and Nice; and is the packet station for Italy and the east. It is in point of population the third town of France, having had, in 1876, 234,690 inhabitants. (Total pop. of commune, including military, 318,868.) The formerly barren country round Marseilles has been of late greatly fertilized by means of the canal which supplies Marseilles with water from the Durance. During a portion of the year the climate of Marseilles is delightful, but in summer and autumn the heat is often intense. Cold, dry, and cutting winds from the n.e. render the climate at times exceedingly trying. In the environs of the town are about 6,000 *bastides*, or country villas.

Marseilles was founded by a Greek colony from Phocæa, in Asia Minor, about 600 years B.C. Its ancient name was *Massalia*, written by the Romans *Massilia*. It was an important member of the ancient Greek community, planted numerous colonies along the north Mediterranean shores, and introduced the germs of Greek civilization into Gaul. The Massaliots were long in intimate alliance with the Romans; but the city was at last taken by Julius Cæsar. In the 8th c. it was destroyed by the Arabs, and the maritime republics of Italy inherited the commerce of the Mediterranean which formerly had been centered in Marseilles. It was united, with the whole of Provence, to France in the reign of Charles VIII. In 1720, when it had again risen to great importance, it was ravaged by a fearful epidemic, and 40,000 of its inhabitants swept away. Since 1830 the commerce and industry of the city have increased vastly. The conquest of Algeria has brought increasing prosperity to Marseilles, and its North African trade is now an important part of its commerce.

MARSH, ANNE CALDWELL, 1798–1874; b. at Lindley Wood, Staffordshire, England. She was the author of more than 20 novels and tales, of which *Emilia Wyndham*, *Mt. Sorel*, and *Mordaunt House* are usually thought the best. Most of her works were written anonymously, and it is not certain how many are rightly attributed to her. Her best work is free from sensationalism, and of delicate conception, but lacks power; several of the stories have been republished in this country. During the latter part of her life she assumed the name of Marsh-Caldwell, and succeeded to the estate of Lindley Wood.

MARSH, GEORGE PERKINS, LL.D., an American philologist, was born at Woodstock, Vt., Mar. 17, 1801; graduated at Dartmouth college, New Hampshire, 1820; studied law at Burlington, Vt.; was elected to the supreme executive council of the state in 1835, and to congress in 1842 and 1849. He was for several years afterwards United States minister resident at Constantinople, and in 1852 was charged with a special mission to Greece. He traveled in the north of Europe, and became an adept in the Scandinavian languages. Between 1857 and 1859 he served as railroad commissioner for Vermont. In 1861 he was appointed U. S. minister in Italy. His most important works are a *Grammar of the Icelandic Language; The Camel, his Organization and Uses; Lectures on the English Language; The Origin and History of the English Language; Man and Nature.*

MARSH, DEXTER, 1806–53; b. Mass.; although possessed of little education, and occupying the humble position of a day-laborer, was a keen observer, and interested in natural history. While engaged in his work he often came across many fossil footprints on the large stone slabs which he quarried for paving-stones. Of these he made an extensive collection from many parts of the Connecticut valley, New Hampshire, and New Jersey. Many of his specimens were sold during his life, and are now distributed among various colleges and museums; but among those retained by him, and sold for over $2,500 after his death, were more than 500 slabs covered with footprints and marks of rain, and about 200 fossil fishes.

MARSH, HERBERT, D.D., 1757–1839; b. London. Having received his education and a fellowship at St. John's college, Cambridge, graduating with great distinction, he

removed to Germany in 1783, and resided several years at Göttingen and Leipsic, where he published, in German, several articles in defense of the policy of England in the continental wars. For this service he was rewarded with a pension on the recommendation of Mr. Pitt. In 1806 he received the title of D.D. by royal mandate. On the French invasion of Germany he returned to England, and in 1807 was appointed lady Margaret's professor of divinity at Cambridge. He abandoned the custom of lecturing in Latin, and lectured only in English. In 1816 he was made bishop of Landaff, and in 1819 of Peterborough. Bishop Marsh was learned in theology, politics, Greek, Latin, German, and oriental literature. He was the first who brought into England the biblical criticism of Germany. His principal works are a translation into English of Michaelis's *Introduction to the New Testament; Authenticity of the Five Books of Moses considered; The National Religion the Foundation of National Education; Lectures on the Criticism and Interpretation of the Bible; Lectures on the Authenticity and Credibility of the New Testament and on the Authority of the Old Testament.* Bishop Marsh was a strong opponent of both Calvinists and Roman Catholics.

MARSH, JAMES, D.D., 1794–1844; b. Hartford, Vt.; graduated at Dartmouth in 1817, and entered the Andover theological seminary, but suspended his studies there after the first year to return to Dartmouth as tutor. Returning to the seminary in 1820, he graduated in 1822. His studies at Andover extended beyond the ordinary limits, and included not only the modern languages, but the then new field of German erudition, and the works of Plato. He was also an appreciative reader of Wordsworth and Coleridge, and an article contributed by him in his senior year to the *North American Review* on ancient and modern poetry attracted wide attention. He also began at the same time a translation from the German of Bellerman's work on the geography of the Scriptures. His intense application to study injured his health, on which account, before his graduation, he visited the southern states. Though strongly disinclined to become a preacher, he was ordained as a Congregational minister in 1824. From 1824 to 1826 he was professor of languages in Hampden Sidney college, Va., giving a portion of his time, however, to the adjacent theological school. Here he began his translation of Herder's *Spirit of Hebrew Poetry*, the first parts of which appeared in the *Christian Repository* at Princeton. In 1826 he was appointed president of the university of Vermont, and it was at his suggestion that some important changes were made in the courses of study in that institution. Finding the duties of president irksome, he resigned the post, and accepted instead the professorship of moral and intellectual philosophy, which he held to the close of his life. In 1829 he contributed to the *Christian Spectator* a review of Stuart's *Commentary on Hebrews*, which contained the germ of his most characteristic writings. At this period he became acquainted with the writings of Coleridge, in which he found much to confirm and strengthen his own convictions. His introduction to the first American edition of the *Aids to Reflection* won him a high reputation at home and abroad. It was reproduced in London, and in 1853 prefixed to a complete American edition of Coleridge's works. In 1830 he published a volume of selections from the old English divines, including Howe's *Blessedness of the Righteous*, and Bates's *Four Last Things*. In 1833 he completed his translation of Herder's *Spirit of Hebrew Poetry*. He contemplated several important works, including a system of logic and a treatise on psychology, which he did not live to complete. His *Remains*, with a *Memoir* by prof. Joseph Torrey, appeared in 1843. He died in Colchester, Vt.

MARSH, OTHNIEL CHARLES, b. Lockport, N. Y., 1831; educated at Phillips academy, Andover, Mass., and at Yale college, where he graduated in 1860; and then took a two years' course of study in the Sheffield scientific school. He was then engaged in the same line of study at the German universities of Heidelberg, Breslau, and Berlin. On his return to this country he was, in 1866, appointed professor of paleontology at Yale, and still holds this position as well as the curatorship of the geological and kindred scientific collections. He is also one of the trustees of the fund of $150,000 given by the late George Peabody to the college "to found and maintain a museum of natural history, and especially in the departments of zoology, geology, and mineralogy," and was most actively concerned in the planning and erection of the massive and fire-proof Peabody museum, which is to form but one wing of the completed building when the funds for building and maintenance have sufficiently accumulated. From 1868 to the present time he has been constantly engaged in the discovery and classification of fossils of extinct animals of the Rocky mountain region, leading many expeditions in person, and directing the operations of others. In these explorations his parties have penetrated into the wildest solitudes under considerable personal hardships and dangers, and have obtained extensive collections of immense scientific value, including fossil animals hitherto unknown, to the number of several hundred. Among the new orders discovered are the *dinocerata*, a six-horned animal of the eocene period; the *pterodactyls*, or flying lizards; the *ichlyornithes*, a cretaceous bird furnished with teeth; and a great variety of bats, monkeys, and marsupials. In many papers published at intervals up to the present time (1881) he has described these and many other species, and is constantly adding to the collection by discovery and purchase. Within a few years the description by prof. Marsh of certain fossil bones found by him and, though belonging to the equine race, differing from the modern horse in several particulars, and markedly in the construction of the foot and

number of toes, has added to the evidences of the doctrine of natural selection and of the evolution of species, exhibiting, as is claimed, the gradual divergence by a species from the primary form, and the result therefrom of what have hitherto been regarded as orders of entirely distinct creation. Prof. Huxley has repeatedly claimed that these discoveries of Marsh completely supply the proof alleged to be wanting by the opponents of the doctrine of the "survival of the fittest."

Prof. Marsh has written many articles on scientific subjects which have appeared in almost all the scientific journals. He is a fellow of the royal geographical society and a member of many other associations at home and abroad.

MARSHAL (Fr. *maréchal*, Teut. *mare*, horse, and *sceale* or *schalk*, servant), a term, in its origin, meaning a groom or manager of the horse, though eventually the king's marshal became one of the principal officers of state in England. The royal farrier rose in dignity with the increasing importance of the *chevalerie*, till he became, conjointly with the constable (q.v.), the judge in the *curiæ martiales*, or courts of chivalry. An earldom is attached to the dignity, and the office of earl-marshal is now hereditary in the family of the duke of Norfolk. When the king headed his army in feudal times, the assembled troops were inspected by the constable and marshal, who fixed the spot for the encampment of each noble, and examined the number, arms, and condition of his retainers. With these duties was naturally combined the regulation of all matters connected with armorial bearings, standards, and ensigns. The constable's functions were virtually abolished in the time of Henry VIII., and the marshal became thenceforth the sole judge in questions of honor and arms. The earl-marshal is president of the English college of arms, and appoints the kings-at-arms, heralds, and pursuivants. The marshal's functions were formerly exercised in time of peace in the *aula regis* or king's great court, and on the division of the *aula regis*, he appointed deputies in the new courts; hence arose the offices of marshal of the king's (queen's) bench and of exchequer, whose principal duty is to take charge of persons committed to their custody by the court. Besides the earl-marshal there is a knight-marshal, or marshal of the king's (queen's) household. The marshal of the king's bench held two different courts, which have been altogether discontinued since 1849. The marshal or provost-marshal of the admiralty is an officer whose duty it is to act ministerially under the orders of the court of admiralty in securing prizes, executing warrants, arresting criminals, and attending their execution.

The dignity of marshal existed formerly in Scotland, where a different orthography was adopted, and the office of marischal was hereditary in the family of Keith. Sir Robert Keith, the marischal, was one of the most distinguished warriors in the army of Robert the Bruce; and his descendant, the marischal, in 1456, had the dignity of earl conferred on him with no other title but that of earl-marischal. There is little doubt that the lyon king-at-arms was, like the English kings-at-arms, originally subject to the marischal, but his dependence ceased at a very early period, and the heraldic functions discharged by the earl-marshal in England devolved in Scotland on the lord lyon, who held office directly from the crown. Scotland had no knight-marischal till 1633, when Charles I., at his coronation, created the office. In 1716 George, tenth earl-marischal, was attainted in consequence of his share in the rebellion of the previous year, and the office has since been in abeyance. In France the highest military officer is called a marshal, a dignity which originated early in the 13th century. There was at first only one *maréchal de France*, and there were but two till the time of Francis I. Their number afterwards became unlimited. Originally the marshal was the esquire of the king, and commanded the vanguard in war; in later times the command became supreme, and the rank of the highest military importance. From the title of this class of general officers the Germans have borrowed their feld-marschall, and we our field-marshal, a dignity bestowed on commanders distinguished either by elevated rank or superior talents.

MARSHAL (*ante*), in the United States, is used in three significations: 1. To denote the ministerial officer of the United States courts, there being one appointed to each judicial district. The duties of this officer resemble those of a sheriff in the state courts; he opens and closes the sessions of the district and circuit courts, serves warrants, and with his deputies enforces the execution of the internal revenue and other U. S. statutes. 2. To denote a leader or director of ceremonies, festivities, or processions. 3. In many states of the south and west the marshal is the head of the municipal police force, and is to be distinguished from the officers of the county called sheriffs, and from the officers of the justice courts called constables. In a few northern cities, formerly, the name was applied with doubtful propriety to special police officers.

MARSHALING OF ARMS is the combining of different coats-of-arms in one escutcheon, for the purpose of indicating family alliance or office. In the earlier heraldry, it was not the practice to exhibit more than one coat in a shield, but the arms of husband and wife were sometimes placed *accollée*, or side by side, in separate escutcheons; or the principal shield was surrounded by smaller ones, containing the arms of maternal ancestors; and we not unfrequently find maternal descent or marriage indicated by the addition of some bearing from the wife's or mother's shield. Then followed *dimidiation*, where the shield was parted per pale, and the two coats placed side by side, half of each being shown. By the more modern custom of impaling, the whole of each coat is exhibited, a reminiscence of the older practice being retained in the omission of bordures,

orles, and tressures on the side bounded by the line of impalement. The most common case of impalement is where the coats of husband and wife are conjoined, the husband's arms occupying the dexter side of the shield, or place of honor, and the wife's, the sinister side. Bishops, deans, heads of colleges, and kings-of-arms, impale their arms of office with their family coat, giving the dexter side to the former.

A man who marries an heiress (in heraldic sense) is entitled to place her arms on a small shield called an *escutcheon of pretense*, in the center of his achievement, instead of impaling.

Quartering, or the exhibiting different *coats* on a shield divided at once perpendicularly and horizontally, is the most common mode of marshaling arms, a practice which, however, was unknown till the middle of the 14th century. The divisions of the shield are called quarters, and are numbered horizontally, beginning at the dexter chief. The most common object of quartering is to indicate descent. The coats quartered in an escutcheon must all have been brought in by successive heiresses, who have intermarried into the family. In the case of a single quartering, the paternal arms are placed in the first and fourth quarters, and the maternal in the second and third. The third and fourth quarters may, in after-generations, be occupied by the arms of a second and third heiress. Sometimes an already quartered coat is placed in one of the four quarters of the escutcheon, then termed a grand quarter. We occasionally find a shield divided by perpendicular and horizontal lines into six, nine, or even more parts, each occupied by a coat brought in by an heiress; and in case of an odd number of coats, the last division is filled by a repetition of the first. In the course of generations, a shield may thus be inconveniently crowded by the accumulation of coats, including the several coats to which each heiress may, in a similar way, have become entitled, and in Germany, sometimes twenty or thirty coats are found marshaled in one escutcheon; but in British heraldry, families entitled to a number of quarterings, generally select some of the most important. Quarterings, at least in Scotland, are not allowed to be added to the paternal coat without the sanction of the heraldic authorities.

Sovereigns quarter the ensigns of their several states, giving precedence to the most ancient, unless it be inferior to the others in importance. In the royal escutcheon of the United Kingdom, England is placed in the first and fourth quarters, Scotland in the second, and Ireland in the third; the relative positions of Scotland and England, being, however, reversed on the official seals of Scotland. Spain bears the arms of Leon in the first and fourth quarters, and Castile in the second and third. An elected king generally places his arms surtout on an escutcheon of pretense.

MARSHALL, a co. in n.e. Alabama, watered by branches of the Tennessee river and by the Black Warrior; 450 sq.m.; pop. '80, 14,585. It has a rugged surface, broken by mountain ridges, a part of the Appalachian chain. The soil is generally fertile, productions being wheat, Indian corn, sweet potatoes, tobacco, butter, and cotton. Co. seat, Warrenton.

MARSHALL, a co. in n. Illinois, intersected centrally by the Illinois river, navigable to Lacon, and entering lake Peoria in the extreme s.w.; also, by the Peoria and Bureau Valley division of the Chicago, Rock Island and Pacific railroad; the Chicago to Illinois river branch of the Chicago and Alton, forming a junction with the Dwight to Washington and Lacon branch. The Illinois Central forms its e. border, with a junction at Wenona; 360 sq.m.; pop. '80, 15,036—12,610 of American birth, 37 colored. It is drained by Sandy creek, along whose banks and those of the Illinois river the soil is very fertile, and the surface is for the most part level prairie. Its products are: grain, tobacco, wool, sweet potatoes, wine, dairy products, sorghum, honey, and corn. At Henry, in the n. section, is a combination bridge, lock, and dam of the Illinois Improvement. It has manufactures of carriages, woolen goods, pumps, agricultural implements, cooperage, tin, copper, and sheet-iron ware; among its manufactories are foundries, machine shops, and distilleries. Bituminous coal is found and easily mined. Seat of justice, Lacon.

MARSHALL, a co. in n. Indiana, intersected by the Pittsburg, Fort Wayne and Chicago, and the Indianapolis, Peru and Chicago railroads, forming a junction at Plymouth; also by the Baltimore and Ohio railroad; 450 sq.m.; pop. '80, 23,416—22,111 of American birth, 9 colored. It is drained in the s.e. by the head waters of the Tippecanoe river, the Yellow river, and other branches of the Kankakee. Its surface is generally level, and diversified by groves of sugar maple and openings of hard-wood trees. Its soil is fertile and adapted to the raising of live stock, and the cultivation of fruit and vegetables, every kind of grain, wool, dairy products, honey, maple sugar, sorghum, and hops. It has manufactories of furniture, flour, lumber, hubs, wagons, carriages, and wooden goods; also breweries. Iron ore is found. Seat of justice, Plymouth.

MARSHALL, a co. in n. Iowa, intersected by the Central railway of Iowa, and the Cedar Rapids and Missouri river division of the Chicago and Northwestern railway, forming a junction at Marshalltown; 576 sq.m.; pop. '80, 23,752—20,680 of American birth, 123 colored. It is drained by the head waters of the Iowa river and other small streams. Its surface is mostly undulating prairie, with a moderate growth of timber, in which oak and ash predominate. It has a fertile soil, particularly in the valley of the Iowa, producing immense quantities of wheat, every variety of grain, fruit, live stock in great numbers,

wine, tobacco, hops, wool, sweet potatoes, dairy products, honey in large quantities, and sorghum. Its mineral deposits are coal, limestone, and marble. Its leading industries are the quarrying of marble, and the manufacture of soap, wagons, flour, oil, saddlery, and harness. It has machine shops, steam saw-mills for sawing stone, iron foundries, and breweries. Seat of justice, Marshalltown.

MARSHALL, a co. in n. Kansas; 900 sq.m.; pop. '80, 16,135—13,000 of American birth. It borders on Nebraska, and is traversed by the Big Blue and Little Blue rivers, and by the St. Joseph and Denver City and the Central Branch Union Pacific railroads. The surface is in great part a very fertile prairie, on which all the cereals are raised in large quantities. Chief city, Marysville.

MARSHALL, a co. in w. Kentucky, having the Tennessee river for its e. and n. boundary near its confluence with the Ohio, and drained by Clark's river and other tributaries; 400 sq.m.; pop. '80, 9,647—9,619 of American birth, 440 colored. It is intersected in the extreme n. by the Paducah and Elizabethtown railroad. Its surface is uneven and two-thirds covered with timber. Its soil is adapted to the raising of live stock, fruit, every variety of grain, wool, sweet potatoes, wine, sorghum, maple sugar, and hops. Among its manufactures are wagons, tobacco, and flour. Seat of justice, Benton.

MARSHALL, a co. in n. Mississippi, on the border of Tennessee, watered by the Coldwater, Tippah, and Tallahatchie rivers; 750 sq.m.; pop. '80, 29,333. It is intersected by the Mississippi Central railroad. The surface is varied, generally undulating, and the soil fertile. Productions are Indian corn, sweet potatoes, wheat, butter, and cotton. Co. seat, Holly Springs.

MARSHALL, a co. in central Tennessee, watered by the Duck river; 350 sq.m.; pop. '80, 19,260; the surface is generally level and the soil fertile. Productions are lumber, wool, grain, cattle, and live stock. Co. seat, Lewisburg.

MARSHALL, a co. in the s. part of that portion of West Virginia known as the "Panhandle," having the Ohio river on the w. and Pennsylvania on the e.; intersected by the Baltimore and Ohio railroad; 280 sq.m.; pop. '80, 18,840. A level country along the shore of the river, farther back it is undulating, the soil in all instances being fertile and under generally high cultivation. The productions are live stock, grain, and wool; and this county is rich in coal measures, not as yet extensively worked. Co. seat, Moundsville.

MARSHALL, the chief city of Calhoun co., Mich., and part of the township of the same name; pop. '70, 4,623. It is on the Kalamazoo river, and reached by the Michigan Central railroad; 108 m. w. of Detroit and 36 e. of Kalamazoo. The city was incorporated in 1859. Among the public buildings are a court-house, high school, and very fine union school, three banks, many churches, a paper mill, etc. The place is largely engaged in manufacturing flour, for which there are several great mills.

MARSHALL, Humphrey, 1812–72; b. Ky.; graduated at West Point in 1832, and resigned from the army the following year. He studied law and practiced in Louisville. On the outbreak of the Mexican war he joined the command of gen. Taylor, and at the battle of Buena Vista he behaved with great gallantry, leading a memorable charge of the Kentucky volunteer cavalry. At the close of the war he retired to a farm in Kentucky, but in 1849 was elected to congress; and in 1852 represented the United States in China. From 1855 to 1859 he was again in congress, and in 1860 espoused the confederate cause, and received a general's commission in that army. He was defeated by gen. Garfield at Prestonbury, Jan. 7, 1862; but afterwards fought under the command of gen. Kirby Smith. He was a member of the confederate congress during the latter part of the war, having resigned his commission. The latter part of his life was passed in Louisville in the conduct of a lucrative law practice.

MARSHALL, John, ll.d., 1755–1835; b. Va.; educated at Westmoreland school and by a private tutor. He began the study of law in 1773, but before he was called to the bar the revolution broke out, and he soon joined the *Culpeper minutemen*, a Virginia company, and participated in the battle of Great Bridge, where he led a flanking party. The next year he was transferred to the 11th Virginia regiment as a lieut., and in 1777 he was made a capt. He was with the American army in the New Jersey campaign, and was present at Brandywine, Germantown, and Monmouth. He resigned from the army in 1781, and began to practice law, whose study he had resumed at William and Mary college in the winter of 1779 when he was waiting in Virginia to take command of a new force, which was never raised. He was admitted to practice in 1780. His success at the bar was immediate and marked. In 1782 he was returned to the house of delegates from Fauquier co., and the same year became a member of the executive council. In 1787 he was a member of the legislature from Henrico co., to which he had removed. The next year he sat in the Virginia convention called to ratify or reject the constitution framed at Philadelphia. He and James Madison were the foremost supporters of the new instrument, which they succeeded in carrying through the convention. In 1789, 1790, 1791, Marshall served again in the delegates, this time as member for Richmond. He acted with the federalist party, to which the majority of Virginians were opposed; but he succeeded in retaining the confidence of his political opponents.

In 1792 he resumed his law practice, but in 1795 was again elected to the delegates. Jay's treaty had been most bitterly attacked in Virginia, but was defended by Marshall with such ability that the constitutional points, on which the house of delegates had wished to condemn it, were given up; and the delegates passed a simple resolution of disapproval. Marshall, who, for the sake of his practice, which was now grown very large, had refused from Washington the posts of attorney-gen. and minister to France, consented, after considerable demurrer, to go to Paris in 1797 as envoy extraordinary with gen. Pinckney and Elbridge Gerry. The object of their mission was to induce the French directory to remove the restrictions which it had laid upon American commerce. The negotiations proved fruitless, but the ambassadors were warmly received on their return to America in 1798. A public address was presented to Marshall, and members of both houses of congress united in giving him a public dinner. In 1799, at the urgent solicitation of Washington, he permitted the use of his name as federalist candidate for congress, and was elected by a narrow majority. While the canvass was going on, he had been offered, and had refused, a seat upon the U. S. supreme court. In congress he became the leader of the federal party, which was fast losing popular confidence. He did not support, without reserve, the alien and sedition laws, against which Virginia had resolved to protect herself by force, if necessary. In all other measures he supported the administration. His most notable speech was in the case of Jonathan Robbins, who had murdered a man on a British frigate and escaped to this country. President Adams, in accordance with a provision in Jay's treaty, gave Robbins up to the British government, which claimed him as its subject. Mr. Livingston, for the republicans, introduced into congress a resolution censuring the president for his action. Marshall defended Adams in a powerful speech, showing that the surrender of Robbins was an act distinctly within the political power of the executive. In May, 1800, he was appointed by president Adams secretary of war, but before accepting he was made secretary of state. His instructions to Rufus King, our minister to England, in regard to several important controversies then pending between this country and England, form one of the ablest of American state papers. In 1801 he was nominated and unanimously confirmed chief-justice of the United States. His decisions in the supreme court raised it to a point of public respect and professional reputation which certainly have not since been surpassed. Chief-Justice Marshall's decisions, particularly in the departments of constitutional and commercial law, are of the highest authority. Many judges, more familiar with the books, have sat upon the supreme bench; but none with such an acute and penetrating judicial intellect, or so dispassionate in the hearing of causes. "He was," said one of his admirers, "conscience made flesh, reason incarnate." Between the years 1804 and 1807 appeared his *Life of Washington*, in 5 volumes, founded upon study of original documents then unprinted, and defending the political career of Washington and the measures of his administration from the attacks which both—and, it must be added, Washington's private life—had suffered from the republicans. The book received much adverse criticism from the English reviewers, on account of the alleged impurity of its English and its undue size. It was abbreviated and published in 2 volumes in 1832. Justice Story published, in 1839, a selection from Marshall's decisions and other papers under the name of *The Writings of John Marshall upon the Federal Constitution*. "His judgments," says justice Story, "for power of thought, beauty of illustration, variety of learning, and elegant demonstration are justly numbered among the highest reaches of the human mind." In person and manner Marshall was not graceful, but his amiable and genial character made him a pleasant companion and gained warm friends.

MARSHALL, THOMAS FRANCIS, 1801–64; b. Frankfort, Ky.; nephew of the great chief-justice John. At an early age he began practice in the legal profession, and in 1831 opened an office at Louisville. Here he became noted as an eloquent speaker in political campaigns, and was made judge of the Louisville circuit of the superior court. From 1841 to 1843 he served in congress, where he distinguished himself by his eloquence and ready wit. He was a man of brilliant abilities and attractive personal qualities; but, unfortunately, the highest development of his powers was rendered impossible by habits of dissipation. A collection of his speeches and essays has been published by W. L. Barre.

MARSHALL, WILLIAM CALDER, b. Edinburgh, 1813; studied sculpture at the royal academy, under the instruction of Chantrey and Bailey, where he won a gold medal and traveling scholarship, and from 1836 to 1838 continued his studies in Rome. From the time of his return to London, 1839, he contributed to almost every annual art exhibition some graceful piece of statuary. His work may be classed in three divisions: idealistic statuary, historical sculpture, and decoration. Among his numerous productions in the first class may be mentioned: "The Creation of Adam" (1842); "Christ Blessing Little Children" (1844); "Paul and Virginia" (1845); "Sabrina" (1846), perhaps the most popular of all his figures; "The First Whisper of Love;" and "The Dancing Girl Reposing," which last work gained the art-union prize of £500. In historical figures he has modeled the bronze statue of sir Robert Peel at Manchester, one of Dr. Jenner; and in the Westminster palace, busts of Chaucer, lord Clarendon, and lord Somers. In decoration, he has been extensively engaged in the ornamentation of the new houses of

parliament and the Wellington chapel in St. Paul's cathedral. He was also the designer of the Wellington monument. The style of all his productions is marked by simplicity and refinement, and the conception of his statuettes is especially delicate and poetical.

MARSHALLTOWN, capital of Marshall co., Iowa; at the intersection of the Chicago and Northwestern with the Central railroad of Iowa; pop. '70, 4,384. It is the center of a prosperous agricultural region, has 7 churches, 3 banks, 3 public schools, a public library, 3 newspapers, 2 flouring-mills, 2 breweries, 3 grain elevators, and a foundry.

MARSHALSEA PRISON, in Southwark, London, was built in the 12th century. It was for a long time a king's bench prison, but finally used for confining poor debtors. It was broken open by the Gordon rioters in 1780. It was abolished, with the ancient Marshalsea courts, in 1849, and has since been torn down.

MARSH-GAS, or METHANE, also called light carbureted hydrogen and fire-damp. It is generated in muddy bottoms of pools in which water-plants grow. When the mud is stirred bubbles of gas rise to the surface, and are easily collected in an inverted bottle. This gas is a mixture of methane and carbonic acid; the latter is readily removed by agitation with limewater or caustic potash or soda. It is also often disengaged in coal mines, sometimes issuing in streams from fissures, having been pent up in the coal. It is one of the products of the distillation of coal in making illuminating gas. Its formula is CH_4, and it contains 12 parts of carbon and 4 parts of hydrogen, by weight. Its specific gravity is 0.559, having a little more than half the density of common air. Containing, as it does, a large proportion of hydrogen, it forms, when mixed with oxygen, a highly explosive compound. Mixed with common air it is also very explosive, as the terrible accidents in coal mines have unhappily demonstrated. It was a long time before marsh gas could be obtained pure by artificial means. That contained in coal gas and made by passing alcohol through a red-hot tube is exceedingly difficult of separation. Dumas, however, has discovered a method by which it can be readily procured in large quantities, perfectly pure. A mixture is made of 40 parts of crystallized acetate of soda, 40 parts of caustic soda, and 60 parts of quicklime in powder, strongly heated in a retort. The gas is given off in great abundance and may be collected over water. The reaction is as follows: $NaC_2H_3O_2+NaHO=CH_4+Na_2CO_3$. It will be perceived that lime does not enter as an element in this calculation. It is introduced only to prevent the soda from attacking the glass of the retort.

MARSH-HAWK. See HARRIER, *ante*.

MARSH-HEN. See RAIL, *ante*.

MARSH-MALLOW, *Althæa*, a genus of plants of the natural order *malvaceæ*, differing from the true mallows chiefly in the 6 to 9 cleft outer calyx. The species, which are not numerous, are annual and perennial plants, with showy flowers, natives of Europe and Asia. Only one, the COMMON MARSH-MALLOW (*A. officinalis*), is an undoubted native of Britain, and is common only in the south, growing in meadows and marshes, especially near the sea. It has a stem 2 to 3 ft. high, entire or 3-lobed leaves, both leaves and stem densely clothed with soft, starry down, and large, pale, rose-colored flowers on short 3 to 4 flowered axillary stalks. Lozenges made from it (*pâtes de guimauve*) are in use. The whole plant is wholesome, and in seasons of scarcity, the inhabitants of some eastern countries often have recourse to it as a principal article of food. It is said to be palatable when boiled, and afterwards fried with onions and butter. The hollyhock (q.v.) is commonly referred to this genus.

MARSHMAN, JOSHUA, D.D., an English missionary; 1767–1837; b. at Westbury-Leigh, Wiltshire. While young he showed a great passion for reading. His parents being poor, he was obliged to struggle for an education. In 1794 he became master of a school in Bristol, and at the same time a student of Bristol academy, where he studied Latin, Greek, Hebrew, and Syriac. Deciding to devote his life to the missionary work, he was sent in 1799 by the Baptist missionary society to India to join Carey and his colleagues. The East India company being opposed to missions in their territories, they established their mission at Serampore, a town on the Hoogley, 16 m. above Calcutta, containing a mixed population of Danes, Dutch, English, and natives. Finding soon after his arrival the support granted by the society insufficient for the wants of the colony, he, with the aid of his wife, opened two boarding-schools for European children, and shortly after a school for natives, which was soon filled, and the income from this enterprise, supplemented by that of Carey as instructor in the government college at Fort William, enabled them soon to make their mission independent of home support. But their course did not meet the approval of the committee of the society, who censured without sufficient information, pinched the mission, and dictated their management. Some American subscribers remonstrated "against any part of their contributions for training young men to the ministry being employed in teaching science." This disagreement continued for some time, threatening the success of the enterprise. In 1822 Dr. Marshman sent his son John to England to endeavor to restore amicable relations, which mission being unsuccessful, he himself in 1826 returned in order to confer with the society. But he failed in his object, and the matter ended in a separation of the Serampore mission from the society. He returned in 1829 to Serampore. He had experienced a great affliction in the death from cholera of Mr. Ward, with whom he and Dr. Carey

had labored for 23 years. The treatment of the parent society deeply distressed him. He became very melancholy, wandering about unable even to write a letter. In 1834 Dr. Carey died, leaving him alone. In 1836 his daughter, who had married the famous Christian soldier, gen. Henry Havelock, barely escaped with her life from her bungalow, which had caught fire, losing one of her three children in the flames. Soon after Dr. Marshman died from complete nervous prostration. A few days before his death arrangements were made in London for the reunion of the Serampore mission with the parent society, and the retention of Dr. Marshman as superintendent. In addition to his special missionary duties, Dr. Marshman gave himself with great zeal to the study of the Bengalee, Sanskrit, and Chinese languages, which he mastered. He translated into Chinese the book of Genesis, the four Gospels, the epistles of Paul to the Romans and Corinthians. He published also a *Dissertation on the Characters and Sounds of the Chinese Language; The Works of Confucius, containing the Original Text, with a Translation; Clavis Sinica; Elements of Chinese Grammar, with a Preliminary Dissertation on the Characters and Colloquial Medium of the Chinese.* He assisted Dr. Carey in preparing a Sanskrit grammar and a Bengalee and English dictionary. Rammohun Roy having assailed the miracles of Christ in a work entitled *The Precepts of Jesus the Guide to Peace*, Dr. Marshman replied in a series of articles in the *Friend of India* (a periodical issued by the Serampore missionaries), subsequently republished in a volume under the title of *A Defense of the Deity and Atonement of Jesus Christ.* Rammohun Roy replied to this.

MARSH-MAR'IGOLD, *Caltha*, a genus of plants of the natural order *ranunculaceæ*, having about 5 petal-like sepals, no petals, and the fruit consisting of several spreading, compressed, many-seeded follicles. *C. palustris* is a very common British plant, with kidney-shaped, shining leaves, and large yellow flowers, a principal ornament of wet meadows and the sides of streams in spring. It partakes of the acridity common in the order; but the flower-buds, preserved in vinegar and salt, are said to be a good substitute for capers.

MARSH-ROSEMARY, the *statice limonium*, variety *Caroliniana*, natural order *plumbaginaceæ*, a perennial plant, growing in salt marshes along the sea-shore of southern and western Europe. The variety *Caroliniana* is an American plant, growing in similar localities on the American coast. Extending northward along the coast of British America, it passes into *S. bahusiensis.* Marsh-rosemary has a tuft of spatulate-oblong, bristly pointed, one-ribbed leaves, developing in August, a much-branched, panicled scape, from 1 to 2 ft. high, bearing numerous small lavender-colored flowers; fruit, a one-seeded utricle, contained in the base of the calyx. The root is used in medicine. Edward Parrish found it to contain about 12 per cent of tannin, a trace of volatile oil, a little caoutchouc-like matter, gum, and other vegetable principles. Chlorides of sodium and magnesium, and sulphates, are among the inorganic constituents. Marsh-rosemary was long ago a celebrated remedy for hemorrhages, and in recent times has been used for gargles in ulcerated sore throats.

MARSH'S TEST. See ARSENIOUS ACID.

MARSI, an ancient tribe of central Italy, inhabiting the district around the lake Fucinus (*Lago di Celano*). Their origin, like that of other Italian tribes, is involved in obscurity and fiction. They were probably of Sabine origin. They are worthy of notice chiefly on account of their warlike spirit. The Marsians were at one time allies of the Romans, but, in 308 B.C., they revolted and joined the Samnites. After being subdued they again, 301 B.C., shook off the alliance of Rome, but were beaten in the field, and lost several of their fortresses. From this time they continued the firm allies of Rome, contributing by their valor to her triumphs until the Italians were aroused in 91 B.C. to demand a redress of their wrongs and a share in the privileges of Roman citizens. A war ensued, generally known as the social war, but frequently called the Marsic war, because the Marsi were prominent among the malcontents. Their leader was Silus Pompædius. Though often defeated, their perseverance gained the object for which they had taken up arms in 87 B.C. The Marsians, inhabiting a mountainous district, were simple and temperate in their habits, but hardy, brave, and unyielding. So marked was their valor that there was a proverbial saying recorded by Appian, "that Rome had achieved no triumph *over* the Marsi, or *without* the Marsi." The ancient Marsi were represented as enchanters, able to tame serpents and to heal their bites; and it is worthy of note that the jugglers who now amuse the people by handling serpents are natives of the region in the vicinity of *Lago di Celano.* Their only important town was *Marruvium* (San Benedetto), the ruins of which are visible on the east shore of the lake

MAR'SICO NUO'VO, a t. in the Italian province of Potenza, 18 m. S. of the town of Potenza, built on a height, and exposed to violent winds. Pop. '72, 6,125.

MARSILEA'CEÆ, or RHIZOCARPEÆ, a natural order of acotyledonous plants, nearly allied to *lycopodiaceæ*, but differing in the want of a stem, and in the usually stalked leaves. The species are all inhabitants of ditches and pools, chiefly in temperate regions, and two of them occur in various parts of Great Britain. No species was known to be of any importance till the discovery of the nardoo (q.v.) of Australia.

MARSIPOBRANCH'II, the second of the six orders of fishes instituted by Huxley, including the lampreys and the hag-fishes. They are the dermopterous fishes of Owen. See HAG; LAMPREY; *ante*.

MARSIVAN', or MARSOVAN, a village of Asia Minor, in the pashalic of Sivas, and 120 m. n.w. of the town of that name, in a wide undulating plain. Marsivan is a post station of the first class, has many mosques and fountains, and some manufactures of cotton stuffs. Its Greek name is Merziphone.

MARS-LA-TOUR, a village and commune of France, 15 m. from Metz, on the route between Metz and Verdun; pop. 652. It is a manufacturing place of woolens, hard ware, oils, and dye-stuffs. Lumber and grain also are products. In the 15th c. it had a fortified chateau. On Aug. 16, 1870, it was the scene of the bloody battle of Gravelotte between the French and the Germans.

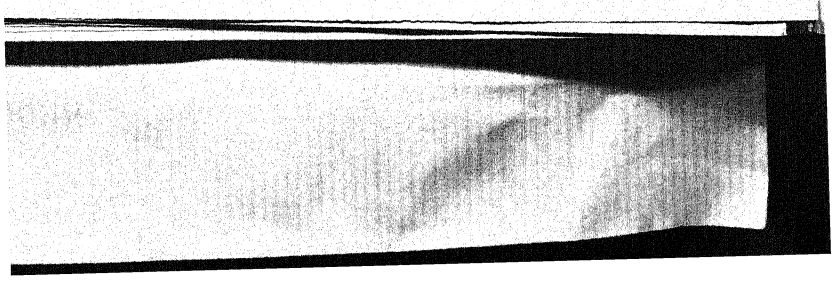
MARSTON, GILMAN, b. in Oxford, N. H., about 1815; graduated at Dartmouth college in 1837, and at the Cambridge law-school in 1840; settled at Exeter, N. H., in 1841; was a member of congress, 1859–63 and 1865–67. He served with distinction in the war for the union, first as col. of the 2d New Hampshire, and afterwards as a brig.gen. of volunteers.

MARSTON, JOHN, 1575–1634; b. England; educated at Corpus Christi college, Oxford, according to Anthony Wood, though this, like many other points in the poet's life, is doubtful. He is satirized under the name of Demetrius in Ben Jonson's *Poetaster*, 1601. The hostility between the two poets seems to have been at an end in 1605, when Marston dedicated to Jonson his play of *The Malcontent*. The same year he joined with Jonson and George Chapman in the authorship of *Eastward Hoe*. James I. imprisoned the three authors on account of some satire which the play contained against the Scotch. Soon after their release the ill-feeling between Jonson and Marston broke out again, for the latter, in the preface to *Sophonisba*, 1606, taunts Jonson with his plagiarisms from Latin writers, and Jonson, in a conversation with Drummond of Hawthornden refers to an enmity of long-standing between himself and Marston. The other works of Marston are: *The Metamorphosis of Pigmalion*, 1598; *Antonio and Mellida*, a tragedy, 1602; *Antonio's Revenge*, a tragedy, 1602; *The Dutch Courtesan*, a comedy, 1605; *Parasetaster*, a comedy, 1606; *What You Will*, a comedy, 1607; *The Insatiate Countess*, a tragedy, 1613; and *The Scourge of Villanie*, a satire of great power. His miscellaneous poetical works were collected and published by Mr. Bowle in 1764.

MARSTON, WESTLAND, LL.D., b. England, 1820; studied law, but left it for literature. He was at one time an editor of the *National Magazine*, and an occasional contributor to the *Athenæum*. He has published *Gerald and other Poems* (1842); a novel called *A Lady in her own Right* (1860); and a collection of stories called *Family Credit and other Tales* (1861). His principal literary activity, however, has been in the direction of dramatic literature, and of his numerous plays we may mention *The Patrician's Daughter*, a tragedy (1841); *The Heart and the World* (1847); *Ann Blake* (1852); *The Favorite of Fortune*, a comedy produced at the Haymarket theater in 1866; *A Hero of Romance* (1867); and *Life for Life*, a play in blank verse, produced at the lyceum theater in 1868, and whose principal character was played by the late Adelaide Neilson.

MARSTON MOOR, a plain in Yorkshire, England, where, July 2, 1644, the royalist force, under prince Rupert, was beaten by the parliamentary forces, English and Scotch, under Fairfax and the earl of Leven. The approach of Rupert forced Fairfax to abandon the siege of York, and he took up his position on Marston Moor, with about 25,000 men. Rupert, with about the same number, came up with him on the afternoon of July 2. It was not till about 7 o'clock that the battle, which had up to this time been little more than a desultory cannonade, began in earnest. Rupert, at the front of the royalist right, made a fierce charge upon the parliamentary left, which broke and fled in disorder. The parliamentary center had likewise been broken by the infantry royalist center, and had suffered heavily. The battle seemed irretrievably lost to the parliamentary leaders, who left the field. But while the royalists were dispersed in search of plunder or in pursuit of the enemy, Cromwell's famous "Ironsides" brigade, with the Scotch regiments, commanded by David Leslie, and some others, rallied, charged the royalists vigorously, and remained masters of the field, capturing 1500 prisoners and all the royalist artillery. The killed and wounded on each side numbered about 2,000. This victory resulted in the occupation of York and the control of the whole north of England by the parliamentary force.

MARSTRAND, WILHELM, 1810–73; b. Copenhagen; studied art there, at Munich, and at Rome. He attained high rank by his *genre* paintings, and became a professor and director of the Copenhagen academy. His most meritorious works are, perhaps, "Return of a Society from a Popular Festival," and "Erasmus Montanus."



MARSUPIA'LIA, or MARSUPIA'TA, an extensive order or group of mammals, differing essentially from all others in their organization, and especially in their generative system. The animals of this aberrant group originally received the name of *animalia crumenata*, or purse-bearing animals; and the names now employed have a similar signification, being derived from *marsupium*, a pouch or bag. This marsupium, or pouch, which is situated on the abdomen of the female, contains the teats, and serves for the protection

of the immature young; and is unquestionably the most marked characteristic of these animals. As the different genera of this order live upon various kinds of food—some being herbivorous, others insectivorous, and others, again, purely carnivorous—we find various modifications of their organs of progression, prehension, and digestion; but as the most important of these modifications are noticed in the articles on the principal genera, we shall confine ourselves to the characters common to the group.

The leading peculiarity presented by the skeleton is the presence of the marsupial bones (see MAMMALIA), which are attached to the pubis, and are imbedded in the abdominal muscles. Another constant but less striking peculiarity is a greater or less inversion of the angle of the lower jaw. The organs of digestion, including the teeth, vary extremely, according to the nature of the food; a complex stomach and a cæcum of considerable size being present in some, while others (the carnivorous genera) have a simple stomach and no cæcum. The brain is constructed on a simpler type than in the placental mammals. The size of the hemispheres is so small that they leave exposed the olfactory ganglion, the cerebellum, and more or less of the optic lobes, and they are but partially connected together by the "fornix" and "anterior commissure," the great cerebral commissure known as the "corpus callosum" being absent. In accordance with this condition of the brain, these animals are all characterized by a low degree of intelligence, and are said (when in captivity) not to manifest any sign of recognition of their feeders. It is, however, in the organs of generation and mode of reproduction that these animals especially differ from all the ordinary mammals. Professor Owen, who has done more to elucidate this subject, and indeed the anatomy and physiology of marsupiata generally, than any other anatomist, observes that in all the genera of this order the uterus is double, and the introductory passage more or less (sometimes wholly) separated into two lateral canals. Both the digestive and generative tubes terminate within a common cloaca (q.v.), and there are various other points in which these animals manifest their affinity to the oviparous vertebrates. The marsupial bones serve important purposes in connection with their generative economy. "In the female," he observes, "they assist in producing a compression of the mammary gland necessary for the alimentation of a peculiarly feeble offspring, and they defend the abdominal viscera from the pressure of the young as these increase in size during their marsupial existence, and still more when they return to the pouch for temporary shelter," while in the males they are subservient to the reproductive process. The marsupials belong to the *aplacental* division of the mammalia (q.v.). The period of their gestation is short (26 days in the Virginian opossum, and 39 days in the kangaroo), and the young are produced in so immature a state that the earlier observers believed that they were produced like buds from the nipples to which they saw them attached. The appearance presented by a young kangaroo of one of the largest species, within 12 hours of its being deposited in the pouch, is described by professor Owen (from personal observation in the zoological gardens) as follows: "It resembled an earthworm in the color and semi-transparency of its integument, adhered firmly to the point of the nipple, breathed strongly but slowly, and moved its fore-legs when disturbed. The body was bent upon the abdomen, its short tail tucked in between the hind-legs, which were one-third shorter than the fore-legs. The whole length from the nose to the end of the tail, when stretched out, did not exceed one inch and two lines." The mother apparently employs her mouth in placing the young at the nipple, where it remains suspended, involuntarily absorbing milk for a considerable time (probably about two months on an average), after which it sucks spontaneously for some months. Although able from the first, by the muscular power of its lips, to adhere firmly to the nipple, it does not possess the strength to obtain the milk by the ordinary process of sucking. In the process it is assisted by the adaptation of a muscle to the mammary gland, which, by contracting, injects the milk from the nipple into the mouth of the adherent fetus; and to prevent the entrance of milk into the air-passage, the larynx is prolonged upwards to the aperture of the posterior nares, where it is closely embraced by the muscles of the soft palate. The air-passage is thus entirely separated from the throat, and the milk passes on either side of the larynx into the esophagus.

Professor Owen has proposed that these animals should be divided into five tribes or primary groups, viz., *sarcophaga, entomophaga, carpophaga, poephaga,* and *rhizophaga,* according to the nature of their food. With the exception of one American and one Malayan genus, all known existing marsupials belong to Australia, Tasmania, and New Guinea.—For further details regarding this order, the reader is referred to Waterhouse's *Natural History of the Mammalia*, vol. i., and to Owen's article "Marsupialia" in the *Cyclopædia of Anatomy and Physiology.*

MARSUPIALIA (*ante*), one of the two orders of non-placental mammals, including the opossum and kangaroo. The other order, *monotremata* (q.v.), includes the *ornithorhynchus*, duck-mole or duck-bill (q.v.). The marsupialia, with the exception of the genus *didelphys* (opossums), are exclusively natives of Australia, Van Diemen's Land, New Guinea, and neighboring islands. They are divided into two primary sections, *diprotodontia* and *polyprotodontia.* Diprotodontia contains three sub-sections: 1. *Rhizophaga*, containing the wombat, a stout, heavy animal 2 or 3 ft. long, having curved, digging claws upon the fore-feet, and a dentition resembling that of the herbivorous rodents. There are two incisors in each jaw, growing from permanent pulps. There are no

canines, and the incisors and premolars are separated by a considerable space. Dental formula: *i.*, $\frac{1-1}{1-1}$; *c.*, $\frac{0-0}{0-0}$; *pm.*, $\frac{1-1}{1-1}$; *m.*, $\frac{4-4}{4-4}$=24. It is nocturnal in habits, feeding upon roots and grass in Australia and Tasmania. 2. *Poephaga.* This section contains the kangaroo (q v.) (*macropodidæ*) and the kangaroo-rat (*hypsiprymnus*). The kangaroo-rats differ from the true kangaroo in their smaller size and well-developed upper canines, and also in having scaly tails, like the opossums. The dental formula of the kangaroo is: *i.*, $\frac{3-3}{1-1}$; *c.*, $\frac{0-0}{0-0}$; *pm.*, $\frac{1-1}{1-1}$; *m.*, $\frac{4-4}{4-4}$=28. 3. *Carpophaga.* The typical animals of this section are the phalangers, so called from the fact that the second and third digits of the hind-feet are united almost to their extremities (see PHALANGER and FLYING-PHALANGER, *ante*). Intermediate between the phalangers and the kangaroos is the kangaroo-bear of the colonists, or the *koala* (q v.) or *phascolarctos*, whose dental formula is. *i.*, $\frac{3-3}{1-1}$; *c.*, $\frac{1-1}{0-0}$; *pm.*, $\frac{1-1}{1-1}$; *m.*, $\frac{4-4}{4-4}$=30.

The second primary section, polyprotodontia, contains two sub-sections. 1 *Entomophaga,* which contains the bandicoot (q.v.), the opossum (q.v.), and the banded ant-eater. The dental formula of the bandicoot is: *i.*, $\frac{5-5}{3-3}$; *c.*, $\frac{1-1}{1-1}$; *pm.*, $\frac{3-3}{3-3}$; *m.*, $\frac{4-4}{4-4}$=48. The dental formula in the opossum is: *i*, $\frac{5-5}{4-4}$; *c.*, $\frac{1-1}{1-1}$; *pm.*, $\frac{3-3}{3-3}$; *m.*, $\frac{4-4}{4-4}$=50. The banded ant-eater, *myrmecobius fasciatus*, is a small, rather pretty animal of south-western Australia, differing from the other *didelphidæ* in not having a prehensile tail. The fore-feet have five toes, while the hind-feet have but four each. It has a number of light and dark bands across its back. These animals are remarkable for the number of their molar teeth, having more than any other marsupial and exceeded only by some of the armadillos. Their dental formula is: *i.*, $\frac{4-4}{3-3}$; *c.*, $\frac{1-1}{1-1}$; *pm.*, $\frac{3-3}{3-3}$; *m.*, $\frac{6-6}{6-6}$=54. 2. *Sarcophaga.* This sub-section includes a number of animals which, unlike most of the order, are carnivorous and very rapacious. The best known are *thylacinus cynocephalus,* or the Tasmanian wolf (see THYLACINE, *ante*), the *dasyurus ursinus,* or ursine opossum, also called "devil," "wildcat," and "hyena" by the settlers (see DASYURE, *ante*), and also the *dasyurus macrurus,* or long-tailed dasyure, sometimes erroneously called the spotted marten, a name given to it in Phillips's *Voyage.* It somewhat resembles the weasel and marten in form, but is more clumsy, although exceedingly vigorous, active, and ferocious. They were very troublesome to the first settlers, as was also the ursine opossum, or "devil," committing various depredations.

The marsupials are regarded as the earliest developed mammals whose fossils have been discovered, although there is some uncertainty. The oldest known European mammal is the *microlestes antiguus* of the upper triassic formation, only the teeth of which have been found, and it is believed to have been a marsupial and related to the banded ant-eater. The two jaw-bones of an allied animal were found in the trias of North America by Prof. Emmons several years ago, and in the opinion of Prof. Owen they belonged to an insectivorous marsupial also allied to the banded ant-eater. In the stone-field slate of the lower oolitic formation a great share of the mammalian remains belong to the small marsupials. In the upper oolite the remains are chiefly marsupial, of the size of a hedgehog and smaller. Fossil marsupialia, allied to the opossum, have been found in Europe in eocene and miocene, and also in the upper Jurassic of North America.

MAR'SUPITES, or TORTOISE ENCRINITES, a genus of extinct crinoids, established by Miller, and found only in the cretaceous formation. The calyx is of large size and the center of its base consists of a single plate, which may be regarded as the uppermost segment of a stem, although the animal is not pedunculated or attached. The pelvis, therefore, resembles a plated pouch surrounded by two cycles of radials. See CRINOIDEÆ, *ante.*

MAR'SYAS, in legend, a Phrygian satyr who entered into a musical competition with Apollo, under an agreement that the defeated contestant should be at the mercy of the winner. The Muses were selected as judges, and awarded the superiority to Apollo, who accompanied his lyre with the voice, while Marsyas played upon the pipe which had been thrown away by Athene. Apollo flayed Marsyas alive, and the tears of the rural divinities for the satyr were said to have formed the river named after him, which flows into the Mæander. The subject was a favorite one with the ancient sculptors.

MARTABAN', the name of a small t. in the province of Pegu, in British Burmah, on the banks of the river of the same name, and near its mouth in the gulf of Martaban, in lat. 16° 32′ n., long. 97° 35′ e., was the first that fell into the hands of the British in the Burmese war in 1852

MARTEL, CHARLES. See CHARLES MARTEL.

MARTELLO TOWERS are round towers for coast defense, about 40 ft. high, built most solidly, and situated on the beach. They occur in several places round the coast

of the United Kingdom; but principally opposite to the French coast, along the southern shore of Kent and Sussex, where, for many miles, they are within easy range of each other. They were mostly erected during the French war as a defense against invasion. Each had walls of 5½ ft. thickness, and was supposed to be bomb-proof. The base formed the magazine; above were two rooms for the garrison, and over the upper of these the flat roof, with a 4½-ft. brick parapet all round. On this roof a swivel heavy gun was to be placed to command shipping, while howitzers on each side were to form a flanking defense in connection with the neighboring towers. Although the cost of these little forts was very great, they are generally considered to have been a failure; their armaments have mostly been removed, and their garrisons of 6 to 12 pensioner-soldiers replaced by coast-guard men, or in some cases by old master-gunners.

The name is said to be taken from Italian towers built near the sea, during the period when piracy was common in the Mediterranean, for the purpose of keeping watch and giving warning if a pirate-ship was seen approaching. This warning was given by striking on a bell with a hammer (Ital. *martello*), and hence these towers were called *torri da martello*.

MARTEN, *Martes*, a genus of digitigrade carnivorous quadrupeds of the family *mustelidæ*, differing from weasels in having an additional false molar on each side above and below, a small tubercle on the inner side of the lower carnivorous cheek-teeth, and the tongue not rough—characters which are regarded as indicating a somewhat less extreme carnivorous propensity. The body is elongated and supple, as in weasels, the legs short, and the toes separate, with sharp, long claws. The ears are larger than in weasels, and the tail is bushy. The martens exhibit great agility and gracefulness in their movements, and are very expert in climbing trees, among which they generally live. Two species are natives of Britain—the COMMON MARTEN, BEECH MARTEN, or STONE MARTIN (*M. foina*), and the PINE MARTEN (*M. abietum*), inhabiting chiefly the more rocky and wooded parts of the island; the former in the s., and the latter in the north. Both were once much more common than they now are, being sought after on account of their fur, and killed on every opportunity, because of their excessive depredations among game and in poultry-yards. The head and body are about 18 in. long, the tail nearly 10 inches. Both species are of a dark tawny color, the common marten having a white throat, and the pine marten a yellow throat. Many naturalists regard them as varieties of one species, of which also they reckon the sable (q.v.) to be another variety. The fur of the martens is of two sorts: an inner fur, short, soft, and copious, and long outer hair, from which the whole fur derives its color. The common marten is much less valuable for its fur than the pine marten, whilst the pine marten is much less valuable than the sable; but skins of the common marten are imported in great numbers from the n. of Europe, and they are often dyed, and sold as an inferior kind of sable. Pine marten skins are imported from the n. of Europe, Siberia, and North America.—The martens generally have their retreats in the hollow trunks of trees, or usurp the nest of a magpie or other bird, but sometimes among rocks. They are capable of a certain amount of domestication.

MARTENSEN, HANS LASSEN, D.D., b. at Flensborg, Denmark, Aug. 19, 1808; studied theology at the university of Copenhagen; and in 1840 became professor at the university, first in philosophy, and afterwards in theology. In the same year appeared his first book, *Meister Eckart*, which was an essay on the mysticism of the middle ages. It was received with much enthusiasm both in Denmark and Germany. In 1841 appeared his *Outline of a System of Ethics*, followed, in 1849, by *Christian Dogmatics*. In the latter the author, as a disciple of Hegel, undertakes to reconcile faith and reason, revelation and science—a task which he performed with such acuteness and ingenuity as to excite the admiration of Christian readers in many countries. In 1845 he was appointed preacher to the Danish court, and in 1853 elevated to the bishoprick of Sealand, the highest dignity of the Danish church. In this position, by his eminent scholarship, his catholic spirit, and his tireless activity, he has exerted a powerful and beneficent influence. In 1872 he published a *System of Christian Ethics*.

MARTEN, SPOTTED, or LONG-TAILED DASYURE. See MARSUPIALIA.

MARTHA'S VINEYARD, an island on the s. coast of Massachusetts, 21 m. long, 6 m. in average width. Edgartown, settled in 1642 by emigrants from Southampton, England, is the largest town. The island has lately been noted for annual camp-meetings attended by 20,000 persons. Pop. '70, 3,688.

MARTHA'S VINEYARD (*ante*), an island 20 m. in length and 3 to 9 m. wide, off the s.e. coast of Massachusetts, is a part of Duke's co., and is separated from Barnstable co. by Vineyard sound, 3½ to 7 m. in width; pop. '70, 3,678. It was discovered by Bartholomew Gosnold in 1602; and at that time was heavily wooded, and contained deer and other game, berries and fruits in profusion, a fresh-water lake, springs, and many wild vines. Gosnold at first gave the name, doubtless in memory of some friend, to a barren islet (No Man's Land) lying s.w. of the larger island to which he afterwards transferred the name. At the period of its discovery, Martha's Vineyard was found to be valuable on account of its growth of sassafras, which was highly esteemed in Europe as a medicine, and of which cargoes were carried away from the island and the main-

'and. In 1647 Thomas Mayhew, who had become governor of this island in 1641, by grant from the earl of Stirling, settled where Edgartown now stands, and where the Mayhew family remained in control until 1710. Members of this family conducted missionary enterprises on the island, among the natives, with great zeal and earnestness, and with such success that Christian villages abounded. The new converts proved their devotion by guarding the island during the progress of king Philip's war; but later on they gradually died out. In 1835 the island of Martha's Vineyard was first used for the purposes of a camp-meeting, 9 tents being pitched on the site of the present camp-ground. This institution continued to thrive until it had grown to its present importance and comprehensive scope. Of late years, the annual gathering for religious purposes has numbered as many as 25,000 persons, the meeting occurring in August, in a large grove of shade-trees. Here a settlement of tasteful cottages has grown up, the site being laid out in streets, lighted at night, and at such a time presenting a scene of fairy splendor. It has become a place of fashionable resort, families from Boston and other cities occupying the cottages during the season. East of the camp-grounds a ledge of bluffs extends along the edge of the shore, overlooking the sea from a height of about 30 feet. Here the village of Oak Bluffs was laid out in 1868, and has since become a fashionable watering-place, visited in the season even from so far s. as New York and Philadelphia. Oak Bluffs is connected with Edgartown by a narrow-gauge railroad. Twenty m. distant, at the w. end of the island, is Gayhead, an abrupt and bold coast-line eminence, which is said to be of volcanic origin. Six m. e. of Oak Bluffs is Edgartown (q.v.), the principal town on the island; and beyond this is Katama bay, which is a place of resort for social entertainment, and has attractions in its beautiful scenery. The island is accessible by steamer from New Bedford and Wood's Holl.

MARTIAL (MARCUS VALERIUS MARTIALIS), the first of epigrammatists, was b. at Bilbilis, in Spain, 43 A.D. In 66 he came to Rome, where he resided till 100, when he returned to his native town. There he married a lady called Marcella, on whose property he lived till his death (about 104). When at Rome he soon became famous as a wit and poet, received the patronage of the emperors Titus and Domitian, and obtained from them the privileges of those who were fathers of three children, and, in addition, the rank of tribune and the rights of the equestrian order. He lived, seemingly, in affluence in a mansion in the city, and in Nomentum, a suburban villa, to both of which he makes frequent reference. From Rome his reputation rapidly extended to the provinces; and even in Britain his *Epigrammata*, which, divided into 14 books, now form his extant works, were familiarly read. These books, which were arranged by himself for publication, were written in the following order: the first 11 (including the *Liber de Spectaculis*) were composed at Rome, with the exception of the third, which was written during a tour in Gallia Togata; the 12th was written at Bilbilis, and the 13th and 14th at Rome, under Domitian. The last two, entitled *Xenia* and *Apophoreta*, describe, in distichs, the various kinds of *souvenirs* presented by the Romans to each other on holidays. To the other books we are also indebted for much of our knowledge of the manners and customs which prevailed under the emperors Nero, Galba, Otho, Vespasian, Titus, Domitian, Nerva, and Trajan, under whose collective reigns he spent 35 years of his life. His works have also a great literary value, as embodying the first specimens of what we now understand by epigram—not a mere inscription, but a poem of two or more lines, containing the terms of an antithesis, which goes off with a repercussion at the close. The wonderful inventiveness and facility displayed by Martial in this species of composition have always received the highest admiration, only qualified by his disgusting grossness, which, blameworthy in him, was even more so in the age by which it was demanded and relished. The best edition of Martial is that of Schneidewin. He has never found an adequate translator.

MARTIAL LAW is a collective name for those laws to which the individuals composing the military and naval forces of a country are subject, but which do not apply to civilians. As, however, the soldier remains a citizen, he is governed by the common law in all matters not coming under the cognizance of the martial law, the degree to which the latter is applicable to his actions varying in different countries, and in times of peace and war. In France and Austria a soldier's offenses against the civil code are dealt with by a court-martial; while among British troops—unless serving against an enemy—the civil tribunals deal with non-military offenses.

The maintenance of discipline and other obvious causes necessitate, for a body of armed men, a code of laws and regulations much more strict and severe in their penalties, as well as more prompt in their execution, than suffices for ordinary society. Accordingly there have always been martial laws, more or less clearly defined, where there have been armies. For the nature of the rules under which the discipline of the British army is kept up, see ARTICLES OF WAR and MUTINY ACT.

There is yet another phase of martial law, and that is the degree of severity which may be applied to an enemy. All authorities agree that the life of an enemy taken in arms is forfeit to his captor; but modern ideas preclude his being put to death, unless in open resistance; and the massacre of prisoners in cold blood, once thought lightly of, is now esteemed a barbarity, which nothing but the most urgent circumstances, such as their uprising, or their attempted rescue by their countrymen, could justify. The

slaughter of the captive Mamelukes at Jaffa has left an indelible stain on Napoleon's memory. As regards civil population and property, much amelioration has taken place with advancing civilization. Formerly the devastation of the country, and the destruction, accompanied even by torture, of the inhabitants, was deemed a legitimate feature of war. Now, the rule is to spare private property, to respect personal liberty, unless the inhabitants directly or indirectly aid the enemy, and only to lay waste so much ground as military necessities may require. Such at least is the principle professed; but few commanders are able to prevent their troops from deeds of violence. A province occupied by a hostile army is usually considered "under martial law." This means that civil law is defunct, and all government under military regimen; but it is impossible to define the bounds of this martial law; nor is any more correct dictum on the subject likely to be arrived at than that celebrated saying of the duke of Wellington when he described it as "the will of the commander-in-chief."

MARTIAL LAW (*ante*) must be distinguished from both military law and military government. The last denotes the rule of a conquered or insurrectionary district by military authority, while military law is that branch of the law which regards military discipline and the government of persons employed in the military service. Martial law, says Kent, supersedes and suspends the civil law, but military law is superadded and subordinate to the civil law. As good a definition as any of martial law, which is in its nature somewhat indefinite, is that given by prof. Joel A. Parker, in the *North American Review*, Oct., 1861. "It is," he says, "that military rule and authority which exists in time of war, and is conferred by the laws of war, in relation to persons and things under and within the scope of active military operations, in carrying on the war; and which extinguishes or suspends civil rights and the remedies founded on them, for the time being, so far as it may appear to be necessary, in order to the full accomplishment of the purposes of war." It will be seen that martial law is in the highest degree arbitrary and capable of abuse. It may be decreed at will by competent military authority, and the only rule as to the propriety of its being established is the test of necessity. The duke of Wellington, from his place in the English house of lords, deprecated its employment, except under the most urgent pressure, and then only with great modifications.

In a celebrated Ceylon case the late lord chief-justice Cockburn was very reluctant to admit that civil law could be superseded by court-martial, *except* where, as in India, the military government was absolute; but in the same case Blackburn, J., laid down the dictum universally accepted in the United States, that martial law is derived from statutory provisions and founded on paramount necessity. Thus the question as to its *nature* is closely connected with the *manner* of its exercise, and this again with the *responsibility* for such exercise. As to its extent, we may refer to a decision of the U. S. supreme court in the case of *Neal Dow* v. *Bradish Johnson*, October term, 1879. It was *held:* that an officer of the United States, while in service in an enemy's country, was not liable to an action in civil courts for acts done in pursuance of a superior's orders; and when any portion of an enemy's country was in the military possession of the United States, the municipal laws were to be continued in force and administered through the ordinary channels for the protection and benefit of the inhabitants and others not in military service, but not for the protection or control of army officers or soldiers. In the supreme court of Missouri it has been held that the act of congress making the order or authority of the president a good defense for acts done or left undone during the rebellion, is unconstitutional (64 Mo., 564). Where an inferior confederate officer, under the orders of his superior, destroyed large quantities of spirits to preserve the discipline of his command, the courts of Mississippi held that such order was no defense in an action for damages brought after the close of the war.

The whole subject of the relations of the civil and military authorities in time of war, and especially the constitutionality of acts passed distinctly as war measures, is of great interest, and, while much may be *res judicata*, there are many points not yet clearly determined.

MARTIGNY, or MARTINACH (the *Octodurus* of the Romans), a small t. of Switzerland, in the canton of Valais, is situated on the Drance, an affluent of the Rhone, about 24 m. s.s.e. from the e. end of the lake of Geneva. The two noted routes, one to the vale of Chamouni by the Tête Noire or the Col de Balme, and another to the great St. Bernard, branch off here. Martigny is on the Simplon road into Italy. It is a great resort for tourists, and has a population of about 1200.

MARTIGUES, a small t. of France, in the department of Bouches du Rhone, is situated on three islands, united by bridges, in the entrance to the Etang de Berre, 16 m. n.w. of Marseilles. From the peculiarity of its position, it has been called the Provençal Venice. Pop. '76, 4,959, engaged in the tunny and pilchard fisheries.

MARTIN. See SWALLOW.

MARTIN, a co. in s.w. Indiana, intersected by the Ohio and Mississippi railway, drained by the East fork, or Driftwood fork, of the White river, entering it in the n.e., and forming part of its s.w. boundary; about 340 sq.m.; pop. '80, 13,475—13,240 of American birth, 16 colored. Its surface is hilly, with a large portion of tillable land

still covered with forests. Its soil is fertile, and adapted to the raising of live stock, and the production of fruit, buckwheat, oats, corn, rye, wheat, tobacco, wool, the products of the dairy, honey, sorghum, maple-sugar, and flax. Its mineral products are sandstone and coal; and there are sulphur springs in the n. portion. Among its manufactories are flour-mills, and lumber-mills, spoke factories, blast-furnaces, and distilleries. Seat of justice, Shoals.

MARTIN, a co. in e. Kentucky, formed out of portions of Lawrence and Pike counties, has the Tug fork of the Big Sandy river for its e. boundary, separating it from West Virginia; about 220 sq.m.; pop. '80, 3,057—3,053 of American birth, 32 colored. A range of mountains forms its s.w. border, and its general surface is hilly, with a thick growth of hardwood timber on the hill-sides. Its soil, near the river and its tributaries, is fertile, and corn and live-stock are raised. Coal is found and is easily mined, and salt is manufactured. Seat of justice, Warfield.

MARTIN, an e. co. of North Carolina, touching on Albemarle sound, and having the Roanoke river for its n. boundary; 520 sq.m.; pop. '80, 13,140; traversed by the Seaboard and Raleigh railroad. The surface is level and in some portions swampy; the country is heavily wooded. The soil is fertile, producing corn and cotton. Co. seat, Williamston.

MARTIN, a co. in s. Minnesota, having the state line of Iowa for its s. boundary, drained by the Chanyuska river emptying into the Blue Earth river in the next county, with a few small lakes in the n., and Chalk lake in the s. portion; 720 sq.m.; pop. '80, 5,249—4,245 of American birth. Its surface is somewhat undulating, but spreads out into broad prairies for the most part. Its soil is fertile, and adapted to the raising of sheep, the production of Irish potatoes, dairy products, sorghum, honey, and every variety of grain. Its water-power is utilized by flour and saw mills. Seat of justice, Fairmount.

MARTIN, the name of five popes, of whom the fourth and fifth deserve a brief notice.—MARTIN IV. (Nicholas de la Brie), a Frenchman, was elected in 1281. His name is best known in connection with the memorable tragedy of the "Sicilian Vespers." Having been from the time of his election a devoted adherent of Charles of Anjou, he supported that monarch with all his influence, and even by the spiritual censures which he had at his command, in his effort to maintain French domination in Sicily; and it is to his use of the censures of the church in that cause that many Catholic historians ascribe the decline and ultimate extinction of the authority in temporals which the papacy had exercised under the distinguished pontiffs who preceded him. He died at Perugia in 1285.—MARTIN V. must be noticed as the pontiff in whose election was finally extinguished the great western schism (q.v.). He was originally named Otho Colonna, of the great Roman family of that name. On the deposition of John XXIII., and the two rival popes Gregory XII. and Benedict XIII., in the council of Constance, cardinal Colonna was elected. He presided in all the subsequent sessions of the council, and the fathers having separated without discussing the questions of reform, at that period earnestly called for in the church, Martin undertook to call a new council for the purpose. The council was summoned accordingly, after several years, to meet at Siena, and ultimately assembled at Basel in 1431. Martin died in the same year.

MARTIN (*ante*) I., SAINT, d. 655; son of Fabricius, succeeded Theodore I. in the papal chair, A.D. 640; opposed the will of the emperor Constans II. by assembling the first Lateran council at Rome in October, 649, in which the emperor's decrees were denounced, the pope presiding over 104 bishops from Italy, Sicily, Sardinia, and Africa. Five sessions were held, and the judgment of the council was pronounced in 20 canons, anathematizing all those who do not admit the existence in Jesus Christ of two wills and two operations; this being the question as to which the emperor Constans had pronounced for the opposite side. The opposition to his will on the part of Martin enraged the emperor, who ordered the imprisonment of the pope. He was accordingly taken to the island of Naxos in June, 653, and retained there an exile until Sept. 17 of the following year. He was now taken to Constantinople, where he was detained in prison six months. As he still refused to recant his opinions, he was exiled to the Thracian Chersonese, where he suffered great indignities and deprivation until his death. His body was afterwards removed to Rome, and the church of Rome commemorated his name. Eighteen encyclical letters are attributed to him, and are published in Labbe's *Concilia* and the *Bibliotheca Patrum*.—II., or MARINUS I., d. 884; a native of Montefiascone, in the papal states. He was three times papal legate to Constantinople; elected pope Dec. 23, 882, surviving his election only 14 months.—III., or MARINUS II., born in Rome, succeeded Stephen VIII. in 942, and held the papacy 4 years, until his death, which occurred in 946. He was a patron of learning, and was held in high repute as one whose example was Christian and noble.

MARTIN, Bishop of Tours, and a saint of the Roman Catholic church, was b. in Pannonia about the year 316. He was educated at Pavia, and at the desire of his father, who was a military tribune, entered the army, first under Constantine, and afterwards under Julian the apostate. The virtues of his life as a soldier are the theme of more than one interesting legend. On obtaining his discharge from military service, Martin

became a disciple of Hilary, bishop of Poictiers (q.v.). He returned to his native Pannonia, and converted his mother to Christianity, but he himself endured much persecution from the Arian party, who were at that time dominant; and in consequence of the firmness of his profession of orthodoxy, he is the first who, without suffering death for the truth, has been honored in the Latin church as a confessor of the faith. On his return to Gaul, about 360, he founded a convent of monks near Poictiers, where he himself led a life of great austerity and seclusion; but in 371 he was drawn by force from his retreat, and ordained bishop of Tours. The fame of his sanctity, and his repute as a worker of miracles, attracted crowds of visitants from all parts of Gaul; and in order to avoid the distraction of their importunity, he established a monastery near Tours, in which he himself resided. His life by his contemporary, Sulpicius Severus, is a very curious specimen of the Christian literature of the age, and in the profusion of miraculous legends with which it abounds, might take its place among the lives of the mediæval or modern Roman church. The only extant literary relic of Martin is a short *Confession of Faith on the Holy Trinity*, which is published by Galland, vol. vii. 559. In the Roman Catholic church, the festival of his birth is celebrated on Nov. 11. In Scotland this day still marks the winter-term, which is called *Martinmas* (the mass of St. Martin). Formerly people used to begin St. Martin's day with feasting and drinking, hence the French expressions *martiner* and *faire la St. Martin*, "to feast."

MARTIN, ALEXANDER, LL.D., 1740–1807; b. N. J., of Irish parentage; graduated at the college of New Jersey in 1756; removed in 1772 to Guilford co., N. C.; became a member of the colonial assembly; was appointed in 1776 col. of a regiment, and fought at Brandywine and Germantown; was state senator for several terms between 1779 and 1785; speaker of the senate in 1787–88, and acting governor in 1781–82; was elected governor in 1782; re-elected in 1789; was a member of the U. S. constitutional convention; U. S. senator, 1793–99.

MARTIN, BENJAMIN NICHOLAS, D.D., b. at Mount Holly, N. J., Oct. 20, 1816; graduated at Yale college in 1837, and at the divinity school in 1840; settled as pastor of a Congregational church in Hadley, Mass., 1843–47, and as pastor of the Fourth Presbyterian church in Albany in 1848–49. In 1852 he became professor of rhetoric and intellectual philosophy in the university of the city of New York, which place he still retains.

MARTIN, BON LOUIS HENRI, b. at St. Quentin, Feb. 20, 1810; son of a magistrate of that city. At the age of 20 he was recognized as a youth of unusual elevation of mind and independence of spirit, tempered with a mild and modest manner. Educated for the practice of law he found time for his tendency to literary expression in other channels and on many diverse subjects. In partnership with another youth he published a novel entitled *Tour du Loup* in 2 volumes, and contributed quite a number of little poems to the journals. These were followed by many other romances. While working with Paul Lacroix, it was suggested that they should compile a history of France, to be made up of extracts from different authors. One volume was published, when Lacroix abandoned it, but Martin resolved to go on. It became an enormous labor. The first volume of Martin's work appeared in 1837, and 18 volumes followed down to 1854. In 1844 the academy of inscription gave him a prize of 9,000 francs; in 1851 he received the first prize. In 1860 the work as far as completed was published in a new form in 16 octavo volumes. With the history of France by Thierry, it occupies the highest place. Martin is a distinguished member of the republican party in France. In 1848 he was appointed by Carnot provisional minister of public instruction, but the reactionary methods of the government induced him to resign. On the fall of Napoleon he was made mayor of one of the arrondissements of Paris, and endeavored, without success, to dissuade the communists from their assumption of the government. He was elected from two districts to the national assembly, which he entered early in 1871, and took his seat with the extreme left. In July, 1871, he was elected a member of the academy of moral and political science, and in October councilor-general of his native department *de l'Aisne*. Besides the history of France the following are among his works: *Minuit et Midi*, 1832, reprinted in 1855 under the title of *Tancrède de Rohan; L'Abbaye-au-Bois, ou la Femme de Chambre; Histoire de Soissons*, 1837; *De la France, de son génie et de ses destinées*, 1847; *Daniel Manin*, 1855; *L'Unité Italién et la France*, 1861; *Jean Reynaud*, 1863; *Pologne et Moscovie*, 1863; *Vercingetorix*, 1865; *La Russie d'Europe*, 1866; *Histoire de France populaire*, 1867; *Etudes d'archéologie Celtique*.

MARTIN, DAVID, 1639–1721; a French Protestant clergyman, exiled to Holland by the edict of Nantes, where he became professor of philosophy and theology in Utrecht. He was author of the *History of the Old and the New Testament* printed in French and Dutch at Amsterdam in 1700. It was copiously embellished with fine engravings, and is known as *Mortier's Bible*.

MARTIN, FELIX, b. at Auray, France, in 1804. In 1842 he was sent as a French Jesuit priest to Canada to revive the missions there; founded St. Mary's college in Montreal; collected material for the history of Canada, and has published and edited many works throwing light on the old Canadian Jesuit missions; among which are the following: *Manuel du Pèlerin de Notre Dame de bon Secour*, Montreal, 1848; *Relation des Jesuits*,

an enlarged edition of O'Callaghan's work; *Mission du Canada, rélations inedites*, Paris, 1861; *De Montcalm en Canada*, 1867. He assisted Carayon in a series of volumes on the Jesuit missions.

MARTIN, FRANCIS XAVIER, LL.D., 1764–1846; b. France; settled in Martinique, where he engaged in business, but failed. In 1786 he removed to North Carolina, and gave French lessons. He then learned the printer's trade, edited a newspaper, and published a number of works, among them a series of treatises on the duties of public officers, the fruit of his studies for the bar, to which he had already been admitted. He compiled the colonial statutes of North Carolina, and made digests of the state statutes. To him, also, are due the first published volumes of North Carolina state law reports. He served as a judge of the territory of Mississippi for a year, when he was appointed to a similar position in the territory of Orleans. He had already translated, while in North Carolina, the work of Pothier on *Obligations*, and his familiarity with the civil law enabled him to be of great service to the jurisprudence of the new state of Louisiana, whose first attorney-general he was. Two years later, in 1815, he was appointed a justice of the Louisiana state court, and remained in that office till his death. An almost total blindness, from which he suffered during the last ten years of his life, did not interfere with the discharge of his judicial duties. He reported the decisions of the Orleans superior court from 1819 to 1830, and of the Louisiana supreme court from 1813 to 1830. He published a history of North Carolina in 1829 and of Louisiana in 1827. Harvard and Nashville universities conferred upon him the degree of LL.D.

MARTIN, Sir JAMES RANALD, 1800–74; b. at Kilmuir, Skye; entered the medical staff of the Bengal army in 1818. He was appointed sanitary commissioner in England in 1841, knighted in 1860, and made examining physician of the secretary of state for India, inspector-general of hospitals, etc. His work *On the Influence of Tropical Climates*, published in 1855, is regarded as an authority.

MARTIN, JOHN, an English painter, was b. in the neighborhood of Hexham, Northumberland, July 19, 1789, went to London in 1806, and made his first appearance as an exhibitor at the royal academy in 1812. His picture was entitled "Sadak in Search of the Waters of Oblivion," and attracted much notice. It was followed within two years by the "Expulsion from Paradise," "Clytée," and "Joshua commanding the Sun to stand Still." This last, though popularly successful, was the cause of a quarrel with the academy, which cut him off from any of its honors. Till near the close of his life, he painted pictures in a style which was considered "sublime," by the sort of people who thought Montgomery's *Satan* and Pollok's *Course of Time* equal to *Paradise Lost*. The principal of these "sublime" productions are "Belshazzar's Feast" (1821); "Creation" (1824); "The Deluge" (1826); "The Fall of Nineveh" (1828); "Pandemonium" (1841); "Morning" and "Evening" (1844); "The Last Man" (1850). Martin died Feb. 9, 1854.

MARTIN, JOSIAH, 1737–86; b. Va.; entered the British army as ensign in 1756, and was afterwards promoted to the rank of lieut.col. In 1771 he was appointed governor of North Carolina, and at the breaking out of the revolutionary war took refuge on board a British man-of-war; was with the British fleet before Charleston in 1776, and with Cornwallis at the battle of Camden in 1780. After this he withdrew to Long Island, and thence to England, and died in London.

MARTIN, LUTHER, LL.D., 1744–1826; b. New Brunswick, N. J.; graduated at Princeton in 1766; was a prominent lawyer in Virginia and Maryland; a member of congress in 1784–85; attorney-general of Maryland in 1788 and 1818. As a member of the convention which framed the constitution of the United States, he earnestly opposed the adoption of that instrument. In 1814 he was appointed judge of oyer and terminer in Baltimore. He was a zealous friend of Aaron Burr, defending him on his trial for treason. Died in New York.

MARTIN, ROBERT MONTGOMERY, b. England about 1805; distinguished as a geographer and statistician; author of *The Colonies of the British Empire; The British Colonial Library; The History, Antiquities, Topography, and Statistics of Eastern India; Ireland Before and After the Union; China, Political, Commercial, and Social; The Hudson's Bay Territories; The Indian Empire;* and *Progress and Present State of British India* (1862). He was for several years editor of the *Colonial Magazine;* he also superintended the publication of *The Illustrated Atlas and Modern History of the World.*

MARTIN, THEODORE, was b. in Edinburgh in 1816, was educated at the high school, and studied law at the university of that city. In 1846 he became a parliamentary solicitor in London. His first literary undertaking was editing Sir Thomas Urquhart's translation of Rabelais's *Gargantua and Pantagruel* (1838). In 1845 appeared the *Bon Gaultier Ballads*, the joint production of Martin and prof. Aytoun; his translation of *Poems and Ballads of Goethe* (1858); *Danish Dramas* (1857); *Odes of Horace* (1860); *Poems*, original and translated (1862); Dante's *Vita Nuova* (1862); *Faust* (1865); *Life of Professor Aytoun* (1867); *Life of H. R. H. the Prince Consort*, vols. i. ii. iii. (1874–77). Martin in 1851 married Miss Helen Faucit, the well-known actress; in 1875 was made a companion of the bath, and an LL.D. of Edinburgh university.

MARTI'NA, a fine t. of the Italian province of Lecce, situated on a hill 18 m. n.n.e. of Taranto. Pop. '72, 18,102. It has a fine palace in the style of the great Roman palace Panfili.

MARTIN, AIMÉ. See AIMÉ-MARTIN.

MARTINEAU, HARRIET, an English authoress, was b. at Norwich, June 12, 1802. Her education was conducted for the most part at home; from an early age she was a lover of books, and was wont to amuse her solitary hours by committing her thoughts to paper. The deafness which she suffered from her youth no doubt strengthened her habits of study, and had much to do with the working out of her career. She appeared in print (in a religious periodical, the *Monthly Repository*) before she was out of her teens, and when, in 1829, she and her sisters lost their small fortunes by the failure of the house in which their money was placed, she continued to write as she had written before, though now under the new necessity of earning a livelihood. The subjects upon which her pen was exercised are of the most varied kind, including some—such as politics—which have rarely been before attempted by women. Her first volume, entitled *Devotions for Young People*, appeared in 1823; and was followed in 1824 by *Christmas Day*, a tale, and by *The Friend*, a sequel, the year after. In 1826 she published *Principle and Practice*, and *The Rioters;* and for two years thereafter she was busily engaged writing stories and a series of tracts on social matters, adapted mainly for the perusal of the working-classes. In 1830 she produced her *Traditions of Palestine*. During the same year, the association of Unitarian Dissenters awarded her prizes for essays on the following subjects: *The Faith as Unfolded by many Prophets, Providence as Manifested Through Israel*, and *The Essential Faith of the Universal Church*. Her next important literary venture was unique, and in one of the softer sex almost audacious, *The Illustrations of Political Economy*, a series of tales, which met with great and deserved success, and was followed by others illustrative of *Taxation*, and *Poor-Law and Paupers*. In 1834 she crossed the Atlantic, and published her *Society in America* in 1837. In 1839 she published *Deerbrook*, and in 1840, *The Hour and the Man*. She afterwards produced a series of tales for the young, the best known of which are *Feats on the Fiord*, and *The Crofton Boys*. During the period 1839–44, when she was more or less an invalid, she wrote *Life in the Sick-room*. Her recovery she attributed to mesmerism, an avowal which was the cause of a fierce discussion in the scientific world, and exposed herself to much insult and ridicule. On her recovery she published *Forest and Game-Law Tales*. In 1846 she visited Palestine, and collected materials for *Eastern Life, Present and Past*, which she published on her return. Afterwards she completed Mr. Knight's *History of England During the Thirty Years' Peace*. In 1851, in conjunction with Mr. H. G. Atkinson, she published a series of *Letters on the Laws of Man's Social Nature and Development*, and in 1869, *Biographical Sketches* (collected from the *Daily News*). The long catalogue of her literary labors (she wrote more than 100 books) includes her translation of Comte's *Positive Philosophy; Household Education; Health, Husbandry, and Handicraft;* etc. Martineau was a constant contributor to the larger reviews, and the daily and weekly press. She died June 27, 1876; and her *Autobiography*, written and printed many years before, was published with an additional editorial volume in 1877.

MARTINEAU, JAMES, brother of the preceding, was b. at Norwich, April 21, 1805. He was educated for the ministry in connection with the Unitarian body of Christians, and was pastor of congregations in Dublin and Liverpool. He was for many years a professor in Manchester new college, and removed to London when that institution was transferred thither in 1858, becoming one of the pastors of the chapel in Little Portland street. He became principal of the college in 1868, and retired from the pastorate of the chapel in 1874. He was one of the founders of the *National Review*, and has been a frequent contributor to its pages. This periodical may be taken as generally representing his theological views. Martineau is one of the most earnest and lofty of living religious writers. He is deeply read in German theology and philosophy, and is remarkable for strong grasp of thought and power of subtle analysis. He is a master of English style, and in elucidating the most abstract thought he has seldom been surpassed. His principal works are the *Rationale of Religious Inquiry* (1836); *Endeavors After the Christian Life* (1843); *Miscellanies* (1852); *Studies of Christianity* (1858); *Essays, Philosophical and Theological* (1869); and *Hours of Thought on Scripture Things* (1877).

MARTINEAU, JAMES (*ante*), is of French lineage. His father was in humble circumstances—a manufacturer of bombazines. From the beginning of his ministry his sermons attracted attention by their deep earnestness and strong grasp upon the gravest problems of human life. While he was preaching in Liverpool in 1839, he took part with J. H. Thom and Henry Giles in a controversy with thirteen clergymen of the church of England upon themes involving the points of difference between Unitarians and evangelical Christians. The lectures on both sides were published in 2 vols., entitled *Unitarianism Confuted*, and *Unitarianism Defended*. The themes discussed by Mr. Martineau in these volumes were: "The Bible;" "The Deity of Christ;" "Vicarious Redemption;" "The Christian View of Moral Evil;" and "Christianity without Priest and without Ritual." He ranks by universal consent among the profoundest thinkers and metaphysicians of the age, and probably is not surpassed by any living writer for the charming simplicity and forceful clearness of his style. He has done much for his sect, but far more for

Christianity itself by his efforts to reconcile the claims of faith and reason in religion. He has distinguished himself, especially in the last few years, as the champion of spiritual faith against the various schools of atheism and materialism, winning thus the admiration and gratitude of Christians of every name. His *Religion and Modern Materialism* was published in New York in 1874. Since that time he has written quite extensively for current reviews and magazines, though ill-health compelled him several years ago to retire from the pulpit.

MARTINDALE, JOHN H., b. Sandy Hill, N. Y., 1815; graduated at West Point, and served for a time in the army, but resigned in 1836 to become a railroad engineer. In 1838 he settled in Batavia, N. Y., practicing law there until 1851, when he removed to Rochester. He enlisted in the war for the union in 1861, was appointed a brig.gen. of volunteers, and led a brigade in Porter's corps in the peninsular campaign of 1862. He was military governor of the District of Columbia from Nov., 1862, until May, 1864, when he joined the 18th corps of the army of the James, and was in the battles of Cold Harbor and the siege of Petersburg. He resigned on account of ill-health, Sept. 13, 1864, and was elected attorney-general of the state of New York in 1866.

MARTIN DE MOUSSY, JEAN ANTOINE VICTOR, 1810–70; b. at Moussy-la-Vieux, France; studied medicine in Paris, and practiced in the military hospitals. In 1841 he went to Montevideo, S. A., where he was engaged in the practice of medicine for 12 years, keeping all that time a meteorological register. During the siege of Montevideo, which continued 9 years, he was director of the medical service to the French and Italian legions. After the downfall of Rosas, the Argentine dictator, in 1852, Dr. Martin de Moussy was employed by the government of president Urquiza to prepare a geographical description of the republic. In the execution of this task he spent 4 years in constant travel, visiting Paraguay, the Gran Chaco, portions of Chili and Bolivia, and all the Argentine provinces in succession. The results of his labors are embodied in his work in 3 vols., entitled, *Description, géographique et statistique, de la Confédération Argentine.* This work, with the atlas accompanying it, is of the highest authority. Dr. Martin de Moussy was also one of the writers of the *Encyclopédie des Connaissances utiles*, and of the *Dictionnaire Politique.* Died in Paris.

MARTINET, ACHILLE LOUIS, b. Paris, 1806; studied engraving at Rome, where he won the second grand prize in 1826, and the first in 1830. He has engraved from the works of the great Italian painters, and the most celebrated living artists as well. His earliest notable success was an engraving, exhibited in 1835, of Rembrandt's portrait of himself; and among his later works may be mentioned engravings of Murillo's "Nativity," 1869; and Heim's "Martyrdom of St. Juliette," 1873.

MARTINEZ DE LA ROSA, FRANCISCO, 1789–1862; b. Spain; studied law at the university of Granada, and was appointed lecturer on ethics at the university of S. Miguel when less than 20 years old. The French had just invaded Spain, and he entered enthusiastically into the national movement. He was employed by the junta of Granada, his native town, to get arms and supplies for the Spanish cause from the English at Gibraltar, and he afterwards went to England on the same errand. There, in 1811, his first poem, *Zaragoza*, was published. He wrote also, while in London, a sketch of the Spanish war of independence for Blanco White's paper, *El Español*, then being published. On his return to Spain he produced, at Cadiz, a tragedy called *La Viuda de Padilla*, which was successful, and was followed by a comedy *Lo que puede un Empleo*, satirizing political life. In 1813 he was returned to the cortes from Granada, and at once took a high position as an orator. He was a supporter of the constitution of 1812, which king Ferdinand, on his return to Spain in 1814, overthrew, when Martinez was sentenced to imprisonment for 10 years. Released by an insurrection in 1820, he was for a short time secretary of state, but his opinions had somewhat moderated during his absence, and he lost favor with the populace, to avoid whose violence he resigned. The next eleven years of his life were passed in Paris, with an occasional trip to Italy and Germany. Between 1827 and 1837 he published at Paris a collection of his *Obras Literarias* in 5 vols. These contain, besides the *Viuda de Padilla*, 4 other plays: *La Niña en Casa y la Madre en la Mascara; Edipo*, a classical tragedy; *Aben Humeya*, founded on the Moorish insurrection under Philip II.; and *La Conjuracion de Venecia*, written in the manner of the French romanticists. In the collection are also included a *Poetica*, or treatise on the art of poetry, and a number of essays on Spanish literature. In 1830 he was permitted to return to Spain, and began to write a historical novel, *Doña Isabel de Solis*, the last volume of which was not published till 1846. Meanwhile he became the head of a liberal ministry, and was the author of the royal statute of 1834, which created a constitutional government like the English, and took away the ancient privileges of the provinces. The abolition of these privileges caused a revolt by the Basque provinces, which attached themselves to Don Carlos; civil war broke out, Martinez de la Rosa and the moderates became more and more unpopular, an attempt was made upon his life in 1835, and the next year he resigned. He distinguished himself in opposition in the cortes, and he once more took office; but the constitution of 1812 was restored, the royal statute annulled, and on the fall of queen Christina in 1840 he again went to Paris, and resumed the composition of *Espíritu del Siglo*, a work on political science, which had been begun in 1835, and whose tenth and last volume was pub-

lished in 1851. Upon the fall of Espartero he entered the Narvaez cabinet, and was afterwards ambassador to Paris and to Rome. Returning to Spain he was elected president of the chamber of the peers; and he was perpetual secretary of the Spanish academy.

MARTINIQUE or MARTINICO, called by the natives MADIANA, one of the Lesser Antilles, is 40 m. long, about 12 m. broad, and has an area of about 380 sq.m., and '75, 160,831 inhabitants, of whom about 90,000 are black. The island was discovered by the Spaniards in 1493, colonized by the French in 1635, and now belongs to that nation. It is of an oval form, with much indented coasts, and is everywhere mountainous; the highest peak, mount Pelée being considerably more than 4,000 ft. above sea-level. There are six extinct volcanoes on the island, one of them with an enormous crater. The cultivated portion of Martinique (about one-third of the whole) lies chiefly along the coast. The climate is moist, but, except during the rainy season, is not unhealthy, and the soil is very productive. Of the land in cultivation, about three-fifths are occupied with sugar cane. Slavery was abolished in 1848. The island is liable to dreadful hurricanes. A floating dock was opened in 1867, at Fort-la-France, the capital (formerly Fort Royal); a telegraph line thence to St. Pierre (q.v.) was at work in 1866; and since then a railway has been set on foot. The exports exceed a million sterling in annual value.

MARTIN MAR-PRELATE, CONTROVERSY OF. Certain tracts; appeared in England about 1580, described by Hardwick in his church history "as a series of scurrilous libels in which the queen, bishops, and the rest of the conforming clergy were assailed with every kind of contumely." They are supposed to have been written by some Puritan radicals in the height of the controversy between the church and the Puritans. One writer thinks "there is reason to believe that the whole was a contrivance of the Jesuits;" but of this there is no evidence. Two Puritan divines, Udal and Penry, were tried, and charged with the authorship, but they refused to make any disclosures, and the real authorship of the lampoons was never known. Neale, in his history of the Puritans, gives their titles and contents.

MARTINMAS, in Scotland, is one of the four quarter-days for paying rent—viz., Nov. 11.

MARTINSBURG, a t. in n.e. West Virginia, in the neighborhood of the Blue Ridge, a region of great fertility; pop. '80, 6,384. It is at the junction of the Martinsburg and Potomac division of the Cumberland Valley railroad and the Baltimore and Ohio, and is the center of an important and increasing trade. It is 78 m. e. of Cumberland, and 100 m. w. of Baltimore. It is lighted with gas, and has water-works erected at a cost of $90,000, a large court-house, 3 newspapers, 11 churches, 3 banks (one national), with a capital, collectively, of $200,000. It has a fine market, a variety of stores, and a number of railroad repair shops, employing 600 hands. Its industries are the manufacture of furniture and carriages; it has also distilleries, planing and flour mills. There are 6 excellent public schools, and 2 seminaries for girls.

MARTIUS, CARL FRIEDRICH PHILIPP VON, one of the most distinguished of modern travelers and naturalists, b. at Erlangen, 1794. He studied medicine at Erlangen, and had published two botanical works, when he was induced to proceed to Brazil as a member of a scientific expedition sent out by the Austrian and Bavarian governments, and by his researches in that country acquired a reputation inferior perhaps to that of no scientific traveler except Humboldt. He was specially intrusted with the botanical department, but his researches extended to ethnography, statistics, geography, and natural science in general; and his works, published after his return, exhibit a poet's love of nature and great powers of description. These works are: *Reise nach Brasilien* (3 vols. Munich, 1824–31); *Nova Genera et Species Plantarum* (3 vols. Munich, 1824–32); and *Icones Plantarum Cryptogamicarum* (Munich, 1828–34). He also published a most valuable monograph of palms, *Genera et Species Palmarum* (3 vols. Munich, 1823–45). He is the author of a number of other botanical works, some of which are monographs of orders and genera; also of works relative to tropical America, as *Die Pflanzen und Thiere des tropischen Amerika* (Munich, 1831); *Das Naturell, die Krankheiten, das Arzthum und die Heilmittel der Urbewohner Brasiliens* (Munich, 1843); *Systema Materiæ Medicæ Vegetabilis Brasiliensis* (Leip. 1843). He also contributed largely to the *Flora Brasiliensis;* and wrote *Beiträge zur Ethnographie u. Sprachenkunde Amerikas zumals Brazilien* (1867), etc. He was professor of botany and director of the botanic garden at Munich. He died in 1868.

MARTLET, in heraldry, a bird resembling a swallow, with long wings, very short beak and thighs, and no visible legs, given as a mark of cadency to the fourth son. It is also otherwise used as a charge. The martlet was originally meant for the martin, and in the earliest heraldry, it is not deprived of its feet.

MARTOS, a t. of Andalusia, Spain, 16 m. s.w. of the city of Jaen, on a steep hill crowned by an old castle. It is resorted to for its mineral waters. Pop. stated at 11,000.

MARTYN, HENRY, 1781–1812; b. Truro, co. of Cornwall, England; of humble origin, his father being a laborer in the mines of Gwenap. At the age of seven he was placed at the grammar school of Truro with Dr. Carden, where he made great proficiency in the classics. Remaining here till the age of fourteen, he offered himself as a candidate

for a vacant scholarship at Corpus Christi college, Oxford, but, being unsuccessful, he returned to Dr. Carden's school, and after two years' study entered, in 1797, St. John's college, Cambridge; obtained in 1801 the highest academical honor of "senior wrangler" and the prize for the greatest proficiency in mathematics; in 1802 was chosen fellow of his college, besides gaining the first prize for the best Latin prose composition. The sudden death of his father and the earnest preaching with the faithful counsel of Mr. Simeon, the university preacher, led to his conversion and dedication to the ministry. A remark of Mr. Simeon on the good resulting from the services of Dr. Carey in India, and a perusal of the *Life of David Brainerd*, led to his deciding to be a missionary. Bright prospects of honorable distinction at Cambridge, intense enthusiasm in literary pursuits, an exquisite relish for the refined enjoyments of social life, affected not his purpose. After receiving ordination in 1803, he was curate of the rev. C. Simeon; in 1804 he was public examiner in St. John's in the classics and Locke's treatise on the understanding; in 1805 he sailed for India as chaplain in the East India company's service, and reached Calcutta in May, 1806; in September received his appointment to Dinapore, and soon conducted worship among the natives in their own vernacular, and established schools for their instruction. He engaged while here in the study of Sanskrit, in revising the sheets of his Hindustani version of the New Testament, and superintending the Persian translation made by Sabat. He had religious discussions daily with his moonshee and pundit. In 1807 he completed the translation of the Book of Common Prayer into Hindustani. In March of the same year he finished a *Commentary on the Parables*. In 1809 his ministry among the heathen began and he was stationed at Cawnpore. He suffered exceedingly in the journey from Dinapore from the intense heat. And soon after his arrival he preached to a thousand soldiers in a hollow square, in the open air, with the heat so great that even before sunrise many dropped down from its effect. He continued his work among the hundreds of heathen mendicants who crowded around him. Having perfected himself in the Persian language, he decided to extend his labors to that country, and took up his residence at Shiraz, where he revised, with the aid of learned natives, his Persian and Arabic translation of the New Testament, and held discussions with the mollahs and sufis, many of whom were greatly impressed. "Henry Martyn," said a Persian mollah, "was never beaten in argument; he was a good man, a man of God." In view of the effect of his frequent discussions, and of his being engaged in a translation of the New Testament into Persian, the preceptor of all the mollahs wrote an Arabic defense of Mohammedanism. To this Martyn replied in Persian. At Shiraz he held a public discussion with a professor of Mohammedan law, and another more important with Mirza Ibraheem in a court of the palace of one of the Persian princes, where was collected a large body of mollahs. Having finished his translation of the New Testament, he commenced a version of the Psalms from the Hebrew. Having ordered two copies of the New Testament to be prepared, one for the king of Persia, the other for the prince Abbas Mirza, his son, he left Shiraz for Talaiz to make the presentation, but was seized with fever on the way and so prostrated that he found it necessary to seek a change of climate. Compelled thus so relinquish his purpose, sir Gore Ouseley, the British ambassador, promised to present the New Testiment at court, which he did, and the king publicly expressed his approbation of the work. The ambassador also carried the MS. to St. Petersburg, where, under his superintendence, it was printed and put into circulation. Martyn now decided to return to England, and Sept., 1812, set out for Constantinople, reaching Tocat in Asia Minor, where his utter prostration compelled him to stop. Either falling a victim to the plague then raging or sinking under the disease which had so greatly reduced him, he died Oct. 16, 1812, in the 32d year of his age. A monument was erected at Tocat in 1856. He was the author of *Sermons, Controversial Tracts, Journals and Letters.*

MARTYNIA, a genus of plants belonging to the order *bignoniaceæ* (q.v.). They are low, branching annuals with thick stems; leaves simple, rounded; flowers in racemes, large, bell-shaped, and somewhat 2-lipped; fertile stamens, 4, sometimes only 2. The fruit is a pod with a long incurved beak; when ripe the pod splits into 2-hooked horns, opening at the apex, between the horns. Seeds numerous, black, with a thick, wrinkled coat. The plant has a rather unpleasant odor. There are seven or eight species, which are natives of warm countries, except *M. proboscidea*, which is a native of the United States, growing on the banks of the Mississippi, in southern Illinois, and south-westward. It is called the unicorn plant, and is cultivated in gardens for its fruit, which, when the pods are young, are used for making pickles. The leaves of this species are heart-shaped, oblique, entire, the upper alternate; corolla dull white or purplish, or spotted with yellow and purple: endocarp of the fruit crested on one side, long beaked. *M. fragrans*, from New Mexico, has violet purple flowers, having a rather pleasant odor, somewhat like that of vanilla.

MARTYR (Gr. *martyr*, a witness), the name given in ecclesiastical history to those who, by their fearless profession of Christian truth, and especially by their fortitude in submitting to death itself rather than abandon their faith, bore the "witness" of their blood to its superhuman origin. Of the same use of the word, there are some examples also in the New Testament, as in Acts xxii. 20, Apoc. ii. 13, and xvii. 6. But this meaning, as its technical and established signification, is derived mainly from ecclesi-

astical writers. During the persecutions (q.v.) of the Christians in the first three centuries, contemporary writers, as well pagan as Christian, record that many Christians, preferring death to apostasy, became martyrs or witnesses in blood to the faith, often in circumstances of the utmost heroism. The courage and constancy of the sufferers won the highest admiration from the brethren. It was held a special privilege to receive the martyr's benediction, to kiss his chains, to visit him in prison, or to converse with him; and, as it was held that their great and superabundant merit might, in the eyes of the church, compensate for the laxity and weakness of less perfect brethren, a practice arose by which the martyrs gave to those sinners who were undergoing a course of public penance, letters of commendation to their bishop, in order that their course of penance might be shortened or suspended altogether. See INDULGENCE. The day of martyrdom, moreover, as being held to be the day of the martyrs' entering into eternal life, was called the "natal" or "birth" day, and as such was celebrated with peculiar honor, and with special religious services. Their bodies, clothes, books, and the other objects which they had possessed were honored as relics (q.v.), and their tombs were visited for the purpose of asking their intercession. See INVOCATION. The number of martyrs who suffered death during the first ages of Christianity has been a subject of great controversy. The ecclesiastical writers, with the natural pride of partisanship, have, it can hardly be doubted, leaned to the side of exaggeration. Some of their statements are palpably excessive; and Gibbon, in his well-known 16th chapter, throws great doubt even on the most moderate of the computations of the church historians. But it is clearly though briefly shown by Guizot in his notes on this celebrated chapter (see Milman's *Gibbon's Decline and Fall*, i. 598), that Gibbon's criticisms are founded on unfair and partial data, and that even the very authorities on which he relies demonstrate the fallaciousness of his conclusions. Those who are interested in the subject will find it discussed with much learning and considerable moderation in Ruinart's *Acta Primitiva et Sincera Martyrum*. Considerable difference of opinion also has existed as to what, in the exploration of the ancient Christian tombs in the Roman catacombs, are to be considered as signs of martyrdom. The chief signs, in the opinion of older critics, were (1), the letters B. M.; (2), the figure of a palm-tree; and (3), a vial with the remains of a red liquor believed to be blood. Each of these has in turn been the subject of dispute, but the last is commonly regarded as the conclusive sign of martyrdom. The first recorded martyr of Christianity, called the "proto-martyr," was the deacon Stephen, whose death is recorded Acts vi. and vii. The proto-martyr of Britain was Alban, of Verulam, who suffered under Diocletian in 286 or 303.

MARTYR, PETER, Italian historian. See ANGHIERA.

MARTYR, PETER, Protestant reformer. See VERMIGLI, PIETRO MARTIRE.

MARTYROL'OGY, a calendar of martyrs and other saints, arranged in the order of months and days, and intended partly to be read in the public services of the church, partly for the guidance of the devotion of the faithful toward the saints and martyrs. The use of the martyrology is common both to the Latin and to the Greek church, in the latter of which it is called *Menologion* (from *mēn*, a month), or "month-calendar." The earliest extant Greek martyrology, or menology, dates from the 9th century. It was published in 1727 by cardinal Urbini. The oldest Latin martyrology is that attributed to St. Jerome, published in the 11th volume of the collected edition of his works by Vallars; but the genuineness at least of some portions of it is more than doubtful. In the mediæval period, martyrologies were issued in England by Venerable Bede; in France by Florus, Ado, and Usuard; and in Germany by St. Gall, Nolter, and Rabanus Maurus. The so called "Roman Martyrology" is designed for the entire church, and was published by authority of Gregory XIII., with a critical commentary by the celebrated cardinal Baronius in 1586. A still more critical edition was issued by the learned Jesuit, Herebert Rosweide.

MARUT is, in Hindu mythology, the god of wind; his wife is Anjanâ, and his son Hanumân (q.v.). Bhîma, the second of the Pându princes (see MAHÂBHÂRATA), is likewise considered as an offspring of this god.

MARVELL, ANDREW, an English writer and politician, was b. Nov. 15, 1620, at Hull, in Yorkshire, where his father was master of the grammar-school and lecturer of Trinity church. He studied at Trinity college, Cambridge, and afterwards spent several years in various parts of the continent, "to very good purpose," according to Milton. He returned to England about 1653, and was employed by Oliver Cromwell as tutor to a Mr. Dutton; in 1657 he became assistant-secretary to Milton; and in 1660 was chosen by his native town to represent it in parliament. Marvell's parliamentary career was both singular and honorable. Without fortune or influence, possessing no commanding talent as a speaker, nor, indeed, brilliant intellectual qualities of any kind, he maintained a character for integrity so genuine and high that his constituency felt itself honored by his conduct, and allowed him to the end of his life "a handsome pension." Otherwise, it would have occasionally fared ill with this incorruptible patriot, for he was often reduced to great pecuniary straits. Charles II. made many but fruitless efforts to win him over to the court-party. The story of the interview between Marvell and the lord treasurer Danby, who had found out the patriot's lodgings (with difficulty) "up two

pair of stairs in one of the little courts in the Strand," is believed to be essentially true, and indicates a certain noble republican simplicity of nature which cannot be too highly admired. Marvell died Aug. 16, 1678, not without suspicion of poison. His writings, partly in verse and partly in prose, are satirical, sharp, honest and pithy (like his talk), but they relate to matters of temporary interest, and are now well-nigh forgotten. An edition of them was published, along with a life of the author, by capt. Edward Thompson, London, 1776.

MARVEL OF PERU. See JALAP.

MARVIN, ENOCH M., D.D., b. Warren co., Mo., June 12, 1823; in 1841 became a minister of the Methodist Episcopal church and a member of the Missouri conference. He was elected a bishop of the M. E. church, south, at the general conference held in New Orleans in 1866. He enjoys a high reputation as a preacher, and has published a treatise on *The Work of Christ.* His official residence is at St. Louis.

MARWAR. See JOUDPORE, *ante.*

MARX, KARL, b. Prussia, 1818; educated at Bonn and Berlin; in 1842 went to Cologne, where he edited the *Rheinische Zeitung* for a year, when it was suppressed. He now established himself in Paris and undertook, with Arnold Ruge, the publication of an edition of Hegel's *Philosophy of Jurisprudence*, revised, and other literary labors. Having employed the press to attack Prussia, the Prussian government asked his expulsion from France, which was granted, and he settled in Brussels in 1846. He had now become interested in the International, the new socio-political organization, and devoted himself with ardor to the promulgation of advanced views concerning the rights of labor and of the laboring-class. After the revolution of 1848 he again went to Paris, his sentence of banishment being now rendered inoperative; but soon afterwards established in Cologne the *Neue Rheinische Zeitung,* in the interest of social and political liberty. He was by this time a pronounced agitator, constantly embroiled with the authorities on account of the progressive character of his ideas and the boldness of his utterances. In 1849 he committed himself in the instance of the Baden insurrection, and was expelled from Germany, retiring once more to France and thence to London, where he has resided ever since. In 1864 he became a member of the International; and having been chosen to prepare the constitution and other initial documents of the organization, these were adopted at the congress of Geneva in 1866. In framing these important documents, Marx came in competition with Mazzini and Bakunin, both of whom prepared programmes for this occasion. The statement by Marx of the foundation and motive of the International, is precise, definite, and conclusive, without being so radical and revolutionary as the ideas of some of its members, including Marx himself; who, on the occurrence of the atrocities of the commune in Paris, did not hesitate to issue a pamphlet indorsing the action of the communists. The rules of the International, as framed by Marx and adopted by the congress of Geneva, were as follows: "Considering that the emancipation of the working classes must be conquered by the working classes themselves; that the struggle for the emancipation of the working classes means not a struggle for class privileges and monopolies, but for equal rights and duties, and the abolition of all class rule; that the economical subjection of the man of labor to the monopolizer of the means of labor, that is, the sources of life, lies at the bottom of servitude in all its forms, of all social misery, mental degradation and political dependence; that the economical emancipation of the working classes is therefore the great end to which every political movement ought to be subordinate as a means; that all efforts aiming at that great end have hitherto failed, from the want of solidarity between the manifold divisions of labor in each country, and from the absence of a fraternal bond of union between the working classes of different countries; that the emancipation of labor is neither a local nor a national, but a social problem, embracing all countries in which modern society exists, and depending for its solution on the concurrence, practical and theoretical, of the most advanced countries; that the present revival of the working classes in the most industrious countries of Europe, while it raises a new hope, gives solemn warning against a relapse into the old errors, and calls for the immediate combination of the still disconnected movements: for these reasons, the first international workingmen's congress declares that this international association, and all societies and individuals adhering to it, will acknowledge truth, justice, and morality as the basis of their conduct toward each other and toward all men, without regard to color, creed, or nationality. This congress considers it the duty of a man to claim the rights of a man and a citizen, not only for himself, but for every man who does his duty. No rights without duties, no duties without rights. And in this spirit they have drawn up the following rules of the international association: 1. This association is established to afford a central medium of communication and co-operation between workingmen's societies existing in different countries and aiming at the same end, viz.: the protection, advancement, and complete emancipation of the working classes. 2. The name of the society shall be "The International Working Men's Association." 3. The general council shall consist of workingmen belonging to the different countries represented in the international association. It shall from its own members elect the officers necessary for the transaction of business, such as a president, a treasurer, a general secretary, corresponding secretaries for the different countries, etc. The congress appoints annually the seat of the general council, elects a number of mem-

bers, with power to add to their numbers, and appoints time and place for the meeting of the next congress. The delegates assemble at the appointed time and place without any special invitation. The general council may, in case of need, change the place, but has no power to postpone the time of meeting. 4. On its annual meetings, the general congress shall receive a public account of the annual transactions of the general council. In cases of urgency it may convoke the general congress before the regular yearly term. 5. The general council shall form an international agency between the different co-operating associations, so that the working men in one country be constantly informed of the movements of their class in every other country; that an inquiry into the social state of the different countries of Europe be made simultaneously, and under a common direction; that the questions of general interest mooted in one society be ventilated by all; and that when immediate practical steps should be needed, as, for instance, in case of international quarrels, the action of the associated societies be simultaneous and uniform. Whenever it seems opportune, the general council shall take the initiative of proposals to be laid before the different national or local societies. To facilitate the communications, the general council shall publish periodical reports. 6. Since the success of the working men's movement in each country cannot be secured but by the power of union and combination, while, on the other hand, the usefulness of the international general council must greatly depend on the circumstance whether it has to deal with a few national centers of working men's associations, or with a greater number of small and disconnected local societies, the members of the international association shall use their utmost efforts to combine the disconnected working men's societies of their respective countries into national bodies represented by central national organs. It is self-understood, however, that the application of this rule will depend upon the peculiar laws of each country, and that, apart from legal obstacles, no independent local society shall be precluded from directly corresponding with the general council. 7. The various branches and sections shall, at their places of abode and as far as their influence may extend, take the initiative not only in all matters tending to the general progressive improvement of public life, but also in the foundation of productive associations and other institutions useful to the working class. 8. Each member of the international association, on removing his domicile from one country to another, will receive the fraternal support of the associated working men. 9. Everybody who acknowledges and defends the principles of the international working men's association is eligible to become a member. Every branch is responsible for the integrity of the members it admits. 10. Every section or branch has the right to appoint its own corresponding secretary. 11. While united in a perpetual bond of fraternal co-operation, the working men's societies joining the international association will preserve their existent organizations intact. 12. Everything not provided for in the present rules will be supplied by special regulations, subject to the revision of every congress."

MARY, The Blessed Virgin (Heb. *Miriam*, Gr. *Maria* or *Mariam*), called in the New Testament "the mother of Jesus" (Matt. ii. 11, Acts i. 14), as the mother of our Lord according to the flesh, is held in high honor by all Christians; and her intercession is invoked with a higher religious worship and a firmer confidence than that of all the other saints, not only in the Roman church, but in all the Christian churches of the east —the Greek, the Syrian, the Coptic, the Abyssinian, and the Armenian. Of her personal history, but few particulars are recorded in Scripture. Some details are filled up from the works of the early fathers, especially their commentaries or deductions from the scriptural narrative; some from the apocryphal writings of the first centuries, and some from mediæval or modern legendaries. The twofold genealogy of our Lord (Matt. i. 1–16, and Luke iii. 23–38) contains the only statement regarding the family of Mary which the sacred writers have left. The genealogy of our Lord in St. Matthew is traced through Joseph; and as it is plainly assumed that Mary was of the same family with her husband Joseph, the evidence of the descent of the latter from David is equivalently an evidence of the origin of Mary from the same royal house. But the genealogy of Christ as traced in St. Luke is commonly held to be the proper genealogy of his mother in the flesh, Mary. Hence it is inferred that the Heli of this genealogy (Luke iii. 23) was the father of Mary; and it may be added, in confirmation of this inference, that Mary is called in the Talmud the "daughter of Heli," and that Epiphanius (Hor. lxxviii. *n.* 17) says her parents were Anna and "Joachim," a name interchanged in Scripture (as 2 Chron. xxxvi. 4) with Eliachim, of which name Eli or Heli is an abridgment. The incidents in her personal history recorded in Scripture are few in number, and almost entirely refer to her relations with our Lord. They will be found in Matt. i., ii., xii.; Luke i., ii.; John ii., xix.; and Acts i., where the last notice of her is of her "persevering in prayer" with the disciples and the holy women at Jerusalem after our Lord's ascension (Acts i. 14). Beyond the few leading facts which will be found under these references, the Scripture is silent as to the life of Mary during the presence of our Lord on earth; nor of her later life is there any record in the canonical Scriptures. The apocryphal gospels, entitled "The Gospel of the Nativity of Mary," and the "Protevangelion of the Birth of Christ," contain some additional, but, of course, unauthentic particulars as to the lineage, birth, and early years of Mary; among which is the miraculous story of her betrothal with Joseph, immortalized by the pencil of Raphael, according to which narrative Joseph was selected from among all who had been pro-

posed as suitors for the hand of Mary by the supernatural sign of a dove issuing from his rod and alighting upon his head. See Protevangelion, cap. viii. As to her history after the ascension of her son, the traditions differ widely. A letter ascribed to the council of Ephesus speaks of her as having lived with John at that city, where she died and was buried. Another epistle, nearly contemporaneous, tells that she died and was buried at Jerusalem, at the foot of the mount of Olives. Connected with this tradition is the incident which has so often formed a subject of sacred art, of the apostles coming to her tomb on the third day after her interment, and finding the tomb empty, but exhaling an "exceeding sweet fragrance." On this tradition is founded the belief of her having been assumed into heaven, which is celebrated in the festival of the assumption. The date of her death is commonly fixed at the year of our Lord 63, or, according to another account, the year 48. Another tradition makes her survive the crucifixion only 11 years.

Many theological questions regarding the Virgin Mary have been raised among Christians of the various churches, which would be quite out of place here. One of these, which possesses present interest, has been treated under a separate head. See IMMACULATE CONCEPTION. The perpetual virginity of Mary is not explicitly attested in Scripture, and there are even certain phrases which at first sight seem to imply that children were born of her after the birth of Jesus, as that of his being called (Matt. i. 25, Luke ii. 7) her "*first*-born son," and that of James and others being more than once called "brothers of the Lord." On the latter argument, no critic acquainted with the wide scriptural use of the word "brother" would ever rely. The former, which was urged anciently by Helvidius and others, but was rejected by the unanimous voice of tradition, is founded on a phrase susceptible of equal latitude of interpretation. The perpetual virginity of Mary is held as a firm article of belief in the Roman and eastern churches. Protestants hold nothing positively on the subject. The controversies regarding the Virgin Mary have reference to the lawfulness of the worship which is rendered to her in some Christian communities. See MARIOLATRY.

MARY, MOTHER OF JESUS (*ante*), was of the lineage of David and probably a daughter of Heli, who stands in Luke's genealogical record first after Joseph. It is stated concerning her in the New Testament: That the home of her youth was in Nazareth; that she became the espoused wife of Joseph, a descendant of David, but before their marriage was told by the angel Gabriel, sent from heaven to Nazareth, that, by the power of the Holy Ghost, she was to become the mother of the Son of God, whom she should name Jesus, and who, raised to the throne of his father David, would reign thereon forever; that, after Joseph also had been divinely informed of the truth concerning her, she was received by him as his wife, and as such retained her virginity until the birth of Jesus, her first-born son, which took place at Bethlehem under the circumstances related by Luke; that, by divine direction, she and Joseph fled into Egypt with Jesus in order to defeat Herod's designs against him; that after Herod's death she returned with her husband and child to Nazareth; and, except during her annual visits to Jerusalem at the feast—in one at least of which, when Jesus was 12 years old, he went with her—remained with him in their home there until his public life and ministry began. After that time she is brought forward four times only in the New Testament: 1. At the marriage in Cana of Galilee, where she said to Jesus, "They have no wine." 2. At Capernaum, when Jesus was teaching a great multitude who were seated attentively around him. Mary, with his brethren, unable to force her way to him, sent messengers, who cried out to him that his mother and his brethren were standing outside wishing to see and talk with him: Jesus did not go out to her or send her any answer; but, without ceasing his instructions, said "Who is my mother and who are my brethren?" and, stretching forth his hand towards his disciples, thus answered his own question, "My mother and my brethren are those who are hearing and doing the word of God"—and with wider application still to all places and all times—"Whosoever is willing to do the will of my Father in heaven, he is my brother and sister and mother." 3. John records that Mary the mother of Jesus, with three or four of her friends, having been standing firmly by the cross, probably from the beginning of the crucifixion, Jesus, just before his death, seeing her there and the beloved disciple standing by her, said to her, "Woman, behold thy son," and to him, "Behold thy mother." After this, knowing that then all things had been accomplished, he spake his last words and uttered his final cry. Thus, amidst all its brevity, the Scripture narrative makes it clear that she who had heard the first infant cry of Jesus heard also his closing cries of anguish; and from that very hour she was comforted in what became to her a beloved home. It is related, also, that she saw the tomb in which his body was laid. 4. After the ascension of Jesus to heaven Luke records the presence of Mary with the apostles, the company of the women, and the brethren of Jesus in the upper room at Jerusalem; where she and they continued strenuously in prayer until, on the day of Pentecost, the Holy Spirit was poured upon them from on high. This is the last scriptural notice of her, and it supplies the last thing certainly known concerning her earthly life. As the inspired narrative introduces her by recording the heavenly benediction pronounced upon her, and her own magnificent song of humble, grateful praise; so it leaves her praying, in common with the rest of the disciples, for the promised blessing from on high. All beyond the above that is related of

her by multitudes of writers in various ages of the church is mere legend. A tender interest and the respect due to her mysterious and sublime relation to the Christ of God, natural concerning her in the minds of all devout Christians, may have been in some degree prevented by the claims for her worship which have been advanced by large portions of the church.

MARY I., Queen of England, daughter of Henry VIII. by his first wife, Catharine of Aragon, was b. at Greenwich on Feb. 18, 1517. She was in her early years a great favorite with her father, who had her carefully educated after the masculine fashion of her time. Erasmus praises particularly the style of her Latin letters. At the age of seven she was betrothed to the emperor Charles V.; but when Henry sought a divorce from queen Catharine, the Spanish monarch broke off the engagement. Her father then tried to marry her to Francis I. of France, but his design did not succeed. Francis, however, asked for his second son, the duke of Orleans, but Henry in turn refused. After the birth of Elizabeth, Henry's affections were diverted to that princess; and when James V. of Scotland sought the hand of Mary, it was refused, on the ground that the issue of such union might imperil the right of Anne Boleyn's children to the crown. This was virtually condemning Mary to celibacy, and doubtless had the effect of making her still more attached to the Catholic party, to which, on account of her training, her natural tendencies, and the wrongs of her mother, she was already closely allied. Several other matrimonial negotiations, with the prince of Portugal, the duke of Cleves, and the duke of Bavaria, also came to nothing. About this time she was in great danger of losing her life, on account of her strong attachment to her mother's interests. Toward the close of Henry's reign, better prospects opened out for her; in 1544 she was restored to her place in the line of succession, of which she had been deprived, and she lived on very good terms with Catharine Parr, the last of her father's numerous wives. During the reign of her half-brother, Edward VI., she lived in retirement, but had three more offers of marriage—from the duke of Brunswick, the markgraf of Brandenburg, and the infante of Portugal—none of which was accepted. On the death of Edward in 1553 she was proclaimed queen; and after a brief and imbecile struggle on the part of those who advocated the claims of lady Jane Grey, was crowned in October of the same year by Stephen Gardiner, bishop of Winchester. A fierce spirit in favor of the papacy soon began to show itself, although it does not appear that Mary herself was at first disposed to be severe; she even occasionally interfered to mitigate the cruelties of Gardiner and Bonner; but after her marriage with Philip of Spain (July 25, 1554), to whose father she had been betrothed many years before, a worse spirit took possession of her, or at least worse counsels prevailed; and those bloody persecutions began which have given her an odious name in history. Her domestic life was wretched; Philip, whom she loved with a morbid passion, proved a sour, selfish, and heartless husband. She had no children, and exasperation and loneliness working upon a temper naturally obstinate and sullen, without doubt rendered her more compliant to the sanguinary policy of the reactionary bishops. Fortunately for England, her reign was brief. She died—after much suffering from dropsy and nervous debility—Nov. 17, 1558. She has been made the subject of a tragedy by Alfred Tennyson.

MARY II., Queen of Great Britain, 1662–94; b. England; daughter of James II. and Anne Hyde, who was daughter of the earl of Clarendon. At the age of fifteen she was married to William, prince of Orange, and went with him to England in 1689. During the same year parliament declared the crown of England vacant by the abdication of James, and conferred it upon William (III.) and Mary. She is said to have been meek and gentle in her disposition, not interfering in the administration of the government, except in the absence of her husband. She died of the small-pox, and left no children.

MARY, BROTHERS OF, a Roman Catholic society founded at Bordeaux in 1817 by G. J. Cheminade, a priest, for the purpose of instruction; confirmed by the pope in 1839; introduced into the United States in 1849, where in 1875 there were 23 houses.

MARYLAND, one of the original 13 American states, lies immediately s. of Pennsylvania, and is bounded on the e. by Delaware and the Atlantic ocean, between lat. 37° 53′ to 39° 44′ n., and long. 75° 4′ to 79° 33′ west. Area, 11,124 sq.m., or 7,119,360 acres; pop. '70, 780,094; income for the year 1877, $2,109,193. The line of Atlantic coast is but 33 m., but including Chesapeake bay, is 411 miles. This bay, 15 m. wide at its mouth, expands to a breadth of 30 m., with numerous islands, and reaches nearly across the state. The country rises gradually from the coast to the tops of the Alleghanies, with great varieties of formation, including deposits of coal, iron, copper, chromate of iron, silicates and hydrates of magnesia, marl, etc. The climate is temperate, and the soil fertile, producing wheat, Indian corn, cotton, tobacco, apples, plums, peaches, grapes. Its chief towns are Baltimore, Annapolis, Fredericktown, Cumberland. Vast quantities of fruit and of oysters are exported from Maryland. The annual produce of coal is valued at about $2,000,000. Maryland has upwards of 850 m. of railway. In 1870 there were 1779 schools in the state—1487 public, 72 classical, professional, and technical (including 2 universities and 19 colleges), and 220 boarding and other schools. There were also 1316 public libraries, 88 newspapers, and 1389 churches. Maryland was settled by a colony of Roman Catholic gentry from England, under a grant to the second lord Baltimore, 1632, when it received its present name in honor of the English queen, Henrietta Maria.

In 1649 it was made, as has been well said, "a land of sanctuary," by the toleration of all religious denominations; but the Puritans, expelled from Virginia, made great trouble in the colony. Organized as a state in 1776, Maryland took a prominent part in the revolution. In the war of 1861, its sympathies were with the south, and the first blood of the war was shed in Baltimore, several Massachusetts volunteers having been killed on their way to Washington. During the war it was invaded from Virgina, and made the scene of bloody conflicts.

MARYLAND (*ante*). The first settlement within the state was that of capt. William Clayborne and his party, on Kent island, in Chesapeake bay, in 1631. George Calvert, the first lord Baltimore, explored the Virginia settlements and Chesapeake bay in 1628, and was delighted with the country; but being a Roman Catholic, and finding the church of England party had full sway, he is supposed to have returned to his possessions in Newfoundland. In 1632, having returned to England, he obtained from the king a renewal of his Newfoundland charter, enlarged to include the territory now forming the states of Maryland and Delaware. He died before the papers were executed, and they were issued by Charles I. to his son Cecelius Calvert, second lord Baltimore, June 20, 1632. The charter conferred upon him and his heirs forever, absolute ownership of the territory, and also civil and ecclesiastical powers of a feudal sort. The name of Maryland was given to the colony in compliment to the queen, Henrietta Maria. Lord Baltimore did not emigrate to America, but made his brother, Leonard Calvert, manager of the expedition, which consisted of 200 persons. They sailed from Cowes, isle of Wight, Nov. 22, 1633, in two small vessels, the Ark and the Dove, and, after touching at several of the West India islands, landed at point Comfort, Va., Feb. 24, 1634. From this point they sailed, Mar. 3, up the Chesapeake and into the Potomac, landing at an island which they called St. Clement's, where, on the 25th, they "offered for the first time in this region of the world the sacrifice of the mass," and erected a large wooden cross as "a trophy to Christ the Savior," chanting before it on bended knees the litany of the cross. Proceeding n. about nine leagues, they entered a river which they called St. George's, and landed on its right bank, where, on Mar. 27, 1634, with appropriate religious and military ceremonies, they consecrated the spot on which they proposed to build a city, to which they gave the name of St. Mary's, of which scarcely a trace remains. The colonists were nearly all Roman Catholics and gentlemen of wealth and respectability, and the intention of lord Baltimore was to found a Catholic province upon a feudal basis, with a hereditary nobility, primogeniture, etc. This scheme was defeated by the operation of a clause in the charter which prescribed that laws could be made only with the "advice, assent, and approbation of the freemen of said province, or of the greater part of them, or of their delegates or deputies." There was a dispute between the assembly and lord Baltimore as to which of them had the right to initiate legislation, but it was settled in 1638 by the concession of the latter that the power should be exercised by the former, and in the next year the first statutes of Maryland were enacted. Clayborne and his colony on Kent island refused to acknowledge allegiance to the new government, and he and his adherents were expelled. In 1642 a company of Puritans, excluded from Virginia for non-conformity, settled at Providence, now Annapolis, and put themselves in opposition to the government. Clayborne also returned from England and regained possession of Kent island. The governor attempted in vain to dispossess him, and he and his partisans, united with the Puritans, became masters of the province, and in 1645 compelled the governor to flee into Virginia. In 1647 the governor returned with a military force and recovered possession of the province. By act of the assembly in 1639 the Roman Catholic religion was made the creed of the state. Ten years later, in 1649, an act was passed declaring that "no person or persons whatsoever, professing to believe in Jesus Christ, shall from henceforth be any way troubled, molested, or discountenanced for and in respect of his or her religion, nor in the free exercise thereof, nor in any way compelled to the belief or exercise of any other religion against his or her consent." The Puritans continuing still to be turbulent, their settlement by way of conciliation was, in 1650, erected into a separate county named Anne Arundel, and as other Puritans still arrived from England, Charles county was shortly afterward organized for their benefit. Their numbers increased to such an extent that in the next assembly they had a majority. In 1652, the royal government of England having been superseded by the commonwealth, commissioners from the mother country visited Maryland, with whom were associated Clayborne, the troublesome opponent of the government founded under lord Baltimore, and Bennett, the Puritan leader of Anne Arundel county. The authority of the English commonwealth was completely established in the colony, and Kent island was given up to Clayborne, while he also acquired Palmer island at the mouth of the Susquehanna. Gov. Stone was first removed, then reinstated. In 1654 lord Baltimore attempted to regain possession of the province and re-establish the proprietary government, but without success. The Puritans established a commission for the government of the colony, placing capt. Fuller at its head. A severe conflict ensued. Providence (now Annapolis) was attacked Mar. 25, 1655, by the proprietary party; but the assault was repulsed, the whole invading force being either killed or taken prisoners, Gov. Stone among the latter. Many of the prisoners were condemned to death, and several were executed. In 1658,

however, the proprietary government was restored. Charles Calvert, son of lord Baltimore, was governor from 1662 to 1676, when the latter died and the former succeeded to his rights, and appointed Thomas Notely as governor. After the overthrow of the commonwealth in 1688, sir Lionel Copley was sent out as governor, and the capital was removed from St. Mary's to Providence, which was thereafter known as Annapolis. In 1714 Charles Calvert, the lord proprietary, died, and was succeeded by his son, Benedict Leonard Calvert, who in turn died in the following year, and was succeeded by his son Charles, a Protestant. Hart, the last of the royal governors, was retained in office. Baltimore was laid out in 1730, Frederick city was founded in 1745, and Georgetown, now in the District of Columbia, was laid out in 1751. In spite of the efforts of the British government to repress manufactures in the colonies, eight copper furnaces and nine forges were in operation in Maryland in 1749, and wine to some extent was produced. The great staple export was tobacco, which was made a legal tender in 1732 at one penny a pound. Maryland took an active part in the war which resulted in the extinction of the French domination upon this continent. The colony was also among the first to oppose the aggressions of the British government which led to the war of the revolution. As early as 1774 the proprietary government was superseded by the authority of the people. A bill of rights and a constitution were adopted in Nov., 1776. The first republican legislature assembled at Annapolis Feb. 5, 1777, and Thomas Johnson was the first republican governor. Maryland took a most efficient and honorable part in the revolutionary war. In 1783 congress met at Annapolis, and it was there on Dec. 23, at the close of the war, that Washington resigned his commission as general-in-chief. The federal constitution was adopted in the Maryland convention April 28, 1788 by a vote of 63 to 11.

The part of the state called the Eastern Shore, lying between Chesapeake and Delaware bays and the Atlantic, is for the most part level, and in some places swampy. Toward the n. extremity the peninsula is somewhat rocky and broken. The Western Shore, lying between Chesapeake bay and the Potomac, is in the s. portion level and sandy, and in some places marshy; but, n. of the point just above Washington on the Potomac, it is first hilly and afterwards mountainous. The main ranges of the Alleghanies pass through the narrow portion of the state extending westward between Pennsylvania and Virginia. The highest mountains are not more than 2,500 ft. high. The most beautiful scenery in the state is in a part of the Cumberland valley, in Washington co., near the Pennsylvania line. The state has on the Atlantic only 33 m. of coast and not a single good harbor; but Chesapeake bay, extending nearly through the state from s. to n., furnishes a coast-line of nearly 500 miles. The bay is navigable through its whole extent, and has some good harbors. Baltimore, the principal city of the state, lies upon an arm of the Chesapeake called Patapsco bay. The Potomac, the principal river, is navigable for about 125 m. on the w. border. The other rivers of the state are: on the Western Shore, the Wicomico, Patuxent, South Severn, Patapsco, Bush, and Susquehanna; on the Eastern Shore, the Pocomoke, Manokin, Nanticoke, Choptank, St. Michael's, Wye, Chester, Sassafras, Elk. Many of these rivers might properly be called estuaries of Chesapeake bay. Chincoteague, Sinepuxent, and St. Martin's bays are sounds lying between the Eastern Shore and the island reefs and barriers which receive the Atlantic surf. Pocomoke sound, Tangier sound, and Eastern bay are a part of the Chesapeake, in which are numerous islands, among them Kent, Bloodworth's, Holland's, Smith's, Tangier, Halfmoon, and Assateague.

Copper, hematitic iron, galena, and manganese, are found in the central portion of the state, while bituminous coal is abundant in the n.w., and bog-iron in the east. Marble, of several varieties, and limestone and sandstone for building, are abundant in the central portion of the state, while traces of gold, nickel, and cobalt have been found in some places.

The wild animals are those usually found on the Atlantic coast. Bears are common in the w., and even the deer has not been exterminated. The fox, raccoon, and opossum are frequently met with. Wild ducks, in great variety, pigeons, partridges, snipe, and quail are found in immense numbers in the e. part of the state. Fish, of excellent quality, are abundant, and the oysters of Chesapeake bay are large and finely flavored.

The principal forest trees of the lowlands are the gum, cypress, cedar, juniper, dogwood, magnolia, holly, elm, cherry, locust, persimmon, beech, sycamore, sassafras, poplar, and red maple, while in the mountainous districts are found several species of oak, maple, walnut, hickory, ash, chestnut, birch, pine, and spruce.

The soil of the e. part of the state is a sandy loam, easily made productive by fertilization. Peaches and market-garden products grow here in great perfection. In the valleys of the central and northern portions of the state the soil is exceedingly fertile, producing large crops of tobacco, wheat, and corn. The climate is equable, subject neither to the severe cold of the north nor to the extreme heat of the south. The low and marshy lands on the Chesapeake and the lower Potomac are to some extent miasmatic, but the rest of the state is generally healthful. The mean annual temperature varies from 54° to 64°. The mercury rarely falls below zero, while the summers are little if any warmer than in Pennsylvania.

The number of farms in 1870 was 27,000; number of acres of improved farm land, 2,914,007; cash value of farms, $170,369,684; of farming implements and machinery,

$5,268,676; amount of wages paid in the year, $8,560,367; value of all farm productions, $35,343,927; value of orchard products, $1,319,405; of produce of market gardens, $1,039,782; of forest products, $613,209; of home manufactures, $63,608; of animals slaughtered or sold for slaughter, $4,621,418; of live stock, $18,433,698; wheat produced, 5,774,503 bush.; rye, 307,089 bush; corn, 11,701,817 bush.; oats, 3,221,643 bush.; Irish potatoes, 1,632,205 bush.; sweet potatoes, 218,706 bush.; tobacco, 15,785,339 lbs.; wool, 435,213 lbs.; butter, 5,014,729 lbs.; cheese, 6,732 lbs.; hops, 2,800 lbs.; flax, 30,760 lbs.; maple sugar, 70,464 lbs.; honey, 118,938 lbs.; wine, 11,583 gallons; milk sold, 1,520,101 gals.; sorgham molasses, 28,563 gals.; hay, 223,119 tons; number of horses, 89,696; mules and asses, 9,830; milch cows, 94,794; working oxen, 22,491; other cattle, 98,074; sheep, 129,697; swine, 257,893; horses not on farms, 12,520; cattle not on farms, 16,040. The wheat crop of 1873 has been estimated at 5,262,000 bush., and valued at over $8,000,000; the rye crop at 309,000 bush., valued at $247,200; corn, 10,451,000 bush., valued at $7,106,680; Irish potatoes, 1,336,000 bush., valued at $935,000; oats, 2,798,000 bush., valued at $1,231,120; tobacco, 19,300,000 lbs., valued at $1,486,100; number of horses, 104,500; of mules and asses, 10,700; of milch cows, 96,900; cattle, 125,600; of sheep, 133,200; of swine, 256,200.

In 1870 Maryland had 5,812 manufacturing establishments, employing 44,860 persons, and having capital amounting to $36,438,729; wages paid, $12,682,817; value of annual products, $76,593,613. The chief lines of manufacturing industry were: refining sugar and molasses, clothing, cotton goods, flouring-mill products, boots and shoes, iron, tin, copper, and sheet-iron ware, tobacco and cigars, canned fruits and vegetables, canned oysters and fish, bread and bakery products, leather, furniture, lumber, malt and distilled liquors, bricks, printing and publishing, and copper smelting. The value of the oysters and fish canned in Baltimore in 1874 was estimated at more than $6,000,000.

The valuation of the property of the state for 1879 was $466,470,995. Adding to this the stock and assets of corporations, estimated at $42,472,896, to total assessment for taxation amounted to $509,213,891. The average amount of tobacco received and shipped for the seven years ending Sept., 1878, was 52,758 hhds. per annum, or an aggregate of 369,306 hhds. The cost of the labor of handling and inspecting was $532,532. The estimated production of the Clearfield coal region for 1879 was about 1,600,000 tons, an increase over the previous year of 330,000 tons. The Cumberland region shipped 1,702,993 tons.

In 1875 there were in Maryland and the District of Columbia 1825 m. of railroad, costing with their equipment $57,318,219. The principal roads are: the Baltimore and Ohio, one of the four great trunk roads across the continent; the Annapolis and Elk Ridge; the Philadelphia, Wilmington, and Baltimore; the Philadelphia and Baltimore Central; the Northern Central; the Frederick and Pennsylvania; the Cumberland and Pennsylvania; the Western Maryland, and the Southern Maryland.

The foreign commerce of the state is confined almost entirely to Baltimore. The imports for the year ending June 30, 1874, were valued at $29,302,311, the foreign exports at $179,598; domestic exports, $27,514,721. There were entered in Baltimore in 1870, from foreign countries, 355 American vessels, aggregating 124,584 tons burden, and employing 3,982 men and boys, and 345 foreign vessels, of 147,706 tons burden, and employing 5,023 men and boys. Clearances in the same year for foreign ports, 256 American vessels, of 91,652 aggregate tons and manned by 3,006 men and boys; and 348 foreign vessels, of 154,917 tons burden, and employing 4,980 men and boys. The coastwise trade embraces oysters, which are taken in immense quantities in Chesapeake bay. Not less than 15,000,000 bush., mostly canned or in jars, are shipped annually, representing a value of from $15,000,000 to $20,000,000. Flour, grain, tobacco, coffee, refined sugar, molasses, cotton, coal, wool, hides, leather, provisions, guano, naval stores, iron, whisky, fish and canned fruits are also among the articles which enter largely into the coastwise and internal traffic. In the year ending June 30, 1874, 1943 steamers engaged in this branch of commerce, and aggregating 1,588,958 tons, entered the ports of the the state. Number of sailing vessels in the same trade, 414. The clearances of vessels in the same trade during the same year were: steamers, 2,046, sailing vessels, 348. The total of entrances and clearances was 4,781 vessels, of 3,308,703 tons burden, and manned by 94,170 men. The value of the exports from Baltimore in 1877 was $39,815,286. The shipments of petroleum in 1876 amounted to 40,812,598 gals.

The number of national banks in 1874 was 33, with an aggregate capital of nearly $14,000,000; and an outstanding circulation of over $9,000,000. In 1835 there were also 13 state banks, with a capital of nearly $4,000,000; also 5 savings banks, with deposits of over $17,000,000, and 22 private banks. In 1878 there were 13 fire insurance companies, all in Baltimore, their premiums in the state amounting to $439,577.29, and their losses to over $68,000. There was also in Baltimore one marine insurance company, premiums $24,000, losses $10,000. There were also in the state 15 mutual insurance companies, premiums nearly $123,000, losses $91,000. Number of fire and marine insurance companies of other states doing business in Maryland, 101—premiums nearly $850,000, losses over $430,000. There were 2 Maryland life insurance companies—premiums $104,000, payments to policy-holders nearly $85,000; 26 life insurance companies of other states, premiums over $1,000,000, payments $1,033,000. The aggregate capital of all the joint-stock insurance companies of the state was $2,728,855; assets, $5,446,996;

liabilities, $3,816,843. The 15 mutual fire insurance companies had assets amounting to nearly $4,000,000, while their liabilities were over $166,000.

The debt of the state, on which interest has to be provided, is a little short of $8,000,000. The receipts of the state treasury for the fiscal year ending Sept. 30, 1879, were $2,126,326; in treasury before, $204,165; total, $2,320,491; disbursements, $1,774,283; balance in treasury, $556,208.

The population of Maryland has increased steadily from the first. In 1790 it was 319,728; in 1850, 583,034; in 1870, 780,894, of whom 175,391 were colored; in 1880, 934,632. The number of church organizations in 1870 was 1420, of church edifices 1389; amount of church property, $12,038,650. The principal denominations were Baptists (including Mennonites, Tunkers, etc.), Episcopalians, Methodists, Roman Catholics, Presbyterians, Lutherans, Friends, German Reformed, and United Brethren in Christ.

The latest school statistics are those of the year ending July 31, 1878. Number of schools, 1989; pupils, 156,274; average attendance, 81,839; number of teachers, 3,071. In Baltimore the schools were opened 10 months of the year; in other counties, a little over 8 months. Total expenditures of the year for school purposes, $1,593,259. There are separate schools for colored children. The state normal school at Baltimore was opened in 1865, and in 1870 had an income from productive funds of $9,500, and a library of 1250 volumes. The Howard normal school for colored pupils has an annual income of $2,000, and a library of 1750 volumes. Normal instruction is also given in St. John's college, Annapolis. The provisions for higher education in Maryland are comparatively ample. The McDonogh bequest, from which the sum of $800,000 had been realized up to 1870, is the foundation of a farm school for boys, now in successful operation. The Peabody institute in Baltimore, endowed by the late Mr. George Peabody with $1,200,000, besides buildings, is intended to found a great library, support an extensive system of lectures, and a conservatory of music. The Johns Hopkins university, founded in 1874 by the late Johns Hopkins of Baltimore, and endowed by him with the sum of $3,500,000, has already taken rank among the best universities of the country. The state agricultural college in Prince George's co. was founded upon the avails of the public lands given for the purpose to the state by the United States. It has a farm of 300 acres. It embraces a collegiate course of four and a scientific course of three years. Provision is also made for students desiring to remain but a single year. The other colleges of the state are Frederick college, at Frederick, Loyola college at Baltimore; Rock Hill college and St. Charles college at Ellicott city; St. John's college at Annapolis; Washington college at Chestertown; Western Maryland college at Westminster. Number of instructors in these institutions, 113; of students, 629. There are also several flourishing seminaries for the instruction of young ladies, and a number of professional schools. The United States naval academy at Annapolis has a library of 16,828 volumes. There are two medical schools; one of them a department of Washington university, the other of the university of Maryland. The Maryland college of pharmacy was founded in 1841; the Baltimore college of dentistry, the oldest of the kind in the world, was founded in 1840. The Maryland dental college was founded in 1873. In 1870, there were in the state 3,353 libraries, containing 1,713,483 volumes; of these, 2,037, containing 1,142,538 volumes, were private. There were 88 newspapers and periodicals —8 daily, 1 tri-weekly, 2 semi-weekly, 69 weekly, and 8 monthly.

The state institutions are the penitentiary, the asylum for the blind (white), and that for the colored blind and deaf at Baltimore; the hospital for the insane, at Spring Grove, Baltimore co.; the institution for the deaf and dumb, at Frederick; and house of refuge for juvenile delinquents, near Baltimore.

The governor of the state is elected for four years. His veto can be overcome only by a three-fifths vote of both houses of the legislature. He has a salary of $4,500. The governor, comptroller, and treasurer constitute the board of public works. The legislature, which meets biennially, consists of a senate and house of representatives. The senators, 26 in number, one from each county, and one from each of the three legislative districts of Baltimore, are elected for four years, one-half retiring biennially. The delegates, 85 in number, are elected for two years by districts defined by the legislature after each census. Members of the legislature are paid $5 per day during the sessions, besides mileage. The court of appeals, composed of the chief judges of the first seven circuits and a judge specially elected in Baltimore, has appellate jurisdiction only. The state is divided into 8 judicial circuits, the city of Baltimore constituting the eighth. In each circuit, except the eighth, a chief judge and two associate judges are elected; and in each county a circuit court is held, having original jurisdiction, both civil and criminal, and appellate jurisdiction of the judgments of justices of the peace. The city of Baltimore has five courts, viz.: the superior court, the court of common pleas, the city court, the circuit court, and the criminal court. A chief judge and four associate judges, constituting the supreme bench of Baltimore, designate one or more of their number to hold these several courts, and any three or more to hold general terms with limited appellate powers. Judges are elected by the people of their respective circuit for a term of 15 years, but cannot serve after they are 70 years of age. The legislature is prohibited from lending the credit of the state to any individual, association, or corporation. Amendments to the constitution must be proposed by three-fifths of each house of the legislature and ratified by the people. Once in every

20 years the people must vote upon the question of holding a convention to revise the constitution. A married woman may acquire, hold, and manage property independently of her husband, and dispose of the same as if single. Her husband must join her, however, in the execution of any deed.

The position of Maryland in the war of the rebellion was peculiar. As a slaveholding state, her sympathies were naturally to a great extent with the south; but her proximity to the north served to modify her feelings in this respect and to keep her from joining the confederacy. A considerable portion of the people were in favor of secession, but a very large majority were strongly opposed. Great efforts were made to keep the state in a neutral position, but without success. A considerable number of men enlisted in the confederate army, but of those who remained at home a majority were loyal to the union. Attempts were made in Baltimore in the first days of the war to prevent the passage of union troops through that city to Washington and the south, and several Massachusetts soldiers were killed in consequence; but the enemies of the union were effectually subdued by the power of the national government, aided by the better portion of the citizens of the state. In spite of the circumstances above mentioned, Maryland contributed 49,780 men to the union armies. The battle of Antietam and several others of less importance were fought on Maryland soil.

The electoral votes of Maryland for president and vice-president have been as follows:—1789, 6 for Washington and R. H. Harrison of Maryland—2 vacancies; 1792, 8 for Washington and Adams; 1796, 7 for Adams and 4 for Jefferson for president; and 4 for Pinckney, 3 for Burr, 2 for John Henry, and 2 vacancies, for vice-president. 1800, 5 each for Jefferson and Burr for president; and 5 each for Adams and Pinckney for vice-president; 1804, 9 for Jefferson and 2 for Pinckney for president; and 9 for Clinton and 2 for King for vice-president; 1812, 6 for Madison and 5 for Geo. Clinton for president; and 6 for Gerry and 5 for Jared Ingersoll for vice-president; 1816, 8 for Monroe and 3 vacancies for president; and 8 for Tompkins and 3 vacancies for vice-president; 1820, 11 for Monroe for president; and 10 for Tompkins and 1 for Robert C. Harper for vice-president; 1824, 7 for Jackson, 3 for J. Q. Adams, and 1 for W. H. Crawford for president; and 10 for Calhoun and 1 for Jackson for vice-president; 1828, 5 for Jackson and 6 for J. Q. Adams for president; and 5 for Calhoun and 6 for Rush for vice-president; 1832, 3 for Jackson, 5 for Clay, and 2 vacancies, for president; and 5 for Sargeant, 3 for Van Buren, and 2 vacancies for vice-president; 1836, 10 for Harrison and R. M. Johnson; 1840, 10 for Harrison and Tyler; 1844, 8 for Clay and Frelinghuysen; 1848, 8 for Taylor and Fillmore; 1852, 8 for Pierce and King; 1856, 8 for Fillmore and Donelson; 1860, 8 for Breckinridge and Lane; 1864, 7 for Lincoln and Johnson; 1868, 7 for Seymour and Blair; 1872, 8 for Thomas A. Hendricks and B. Gratz Brown; 1876, 8 for Tilden and Hendricks; 1880, 8 for Hancock and English.

MARY OF THE INCARNATION (MARIE GUYARD), 1599–1672, b. France; married at the age of 17, a silk manufacturer named Martin, who died two years afterwards. She carried on the silk factory till her son reached the age of 12, when, Jan. 25, 1631, she became an Ursuline nun. In 1639 she settled in Canada, and founded an Ursuline convent in Quebec. She studied and became familiar with some of the Indian languages, and gave instruction to French and Indian scholars. In the political affairs of New France her judgment was highly esteemed, and she sought to impress upon the home government the necessity of controlling the mouth of the Hudson, as a means of protection against Dutch and English assaults. Her life has been written by her son, Dom Claude Martin, who became a Benedictine monk; and by Father Charlevoix, and there is a modern biography of her by the abbé Casgrain, which appeared at Quebec, in 1864.

MARY MAGDALE'NE. See MAGDALENE, MARY, *ante*.

MARYPORT, a seaport of Cumberland, England, at the mouth of the Ellen, 28 m. s.w. of Carlisle by railway. Its origin dates from 1750. Shipbuilding and its kindred employments are carried on extensively, and there are in operation iron-foundries, sawmills, flour-mills, tanneries, breweries, etc. A very large quantity of coal and coke is shipped, especially to Ireland. Maryport has abundant railway connection, and possesses a floating dock and two patent slips. It is a place of resort for sea-bathing. In 1876, 520 vessels, measuring 63,767 tons, entered the port, and 2,002, measuring 230,977 tons, cleared. Pop. '71, 7,443.

MARY, SOCIETY OF, an association of Roman Catholic priests, established at Lyons, France, in 1815, by J. C. M. Colin; sanctioned by the pope in 1831, 1836, and 1873; introduced into the United States in 1862. The principal objects of the association are religious instruction and domestic and foreign missions.

MARY STUART, QUEEN OF SCOTS. This beautiful and accomplished, but most unhappy princess was the daughter of king James V. of Scotland by his second wife, Mary of Lorraine, daughter of Claude, duke of Guise, and widow of Louis of Orleans, duke of Longueville. She was b. at Linlithgow, on Dec. 8, 1542. Her misfortunes may be said to have begun with her birth. Its tidings reached her father on his deathbed at Falkland, but brought him no consolation. "The devil go with it!" he muttered, as his thoughts wandered back to the marriage with Bruce's daughter, which

brought the crown of Scotland to the Stuarts—"it came from a woman, and it will end in a woman!" Mary became a queen before she was a week old. Before she was a twelvemonth old, the regent Arran had promised her in marriage to prince Edward of England, and the Scottish parliament had declared the promise null. War with England followed, and at Pinkie Cleuch the Scots met a defeat only less disastrous than Flodden. But their aversion to an English match was unconquerable; they hastened to place the young queen beyond the reach of English arms, in the island of Inchmahome, in the lake of Monteith, and to offer her in marriage to the eldest son of Henry II. of France, and Catharine de' Medici. The offer was accepted; and in July, 1548, a French fleet carried Mary from Dumbarton, on the Clyde, to Roscoff, in Brittany, whence she was at once conveyed to St. Germain-en-Laye, and there affianced to the dauphin.

Her next ten years were passed at the French court, where she was carefully educated along with the king's family, receiving instructions in the art of making verses from the famous Ronsard. At a somewhat later period, she had the great Scottish scholar Buchanan for her Latin master. On April 24, 1558, her marriage with the dauphin, who was about two years younger than herself, was celebrated, with every circumstance of pomp and splendor, in the church of Notre-Dame, at Paris. It was agreed, on the part of Scotland, that her husband should have the title of king of Scots; but this was not enough for the grasping ambition of France, and Mary was betrayed into the signature of a secret deed, by which, if she died childless, both her Scottish realm and her right of succession to the English crown (she was the great-granddaughter of king Henry VII.) were conveyed to France. On July 10, 1559, the death of the French king called her husband to the throne by the title of Francis II. The government passed into the hands of the queen's kinsfolks, the duke of Guise and the cardinal of Lorraine; but their rule was short-lived. The feeble and sickly king died on Dec. 5, 1560, when the reins of power were grasped by the queen-mother, Catharine de' Medici, as regent for her son, Charles IX. Mary must have been prepared, under almost any circumstances, to quit a court which was now swayed by one whom, during her brief reign, she had taunted with being "a merchant's daughter." But there were other reasons for her departure from France. Her presence was urgently needed in Scotland, which the death of her mother, a few months before, had left without a government, at a moment when it was convulsed by the throes of the Reformation. Her kinsmen of Lorraine had ambitious projects for her marriage; great schemes were based on her nearness of succession to the English crown; and both these, it was thought, might be more successfully followed out when she was seated on her native throne.

She sailed from Calais on the 15th, and arrived at Leith on Aug. 19, 1561, having escaped the English ships-of-war which Elizabeth despatched to intercept her. She wept as the shores of France faded from her sight, and her tears flowed anew when she beheld the rudeness and poverty of Scotland. Her government began auspiciously. The Reformation claimed to have received the sanction of the Scottish parliament, and if Mary did not formally acknowledge the claim, she was at least content to leave affairs as she found them, stipulating only for liberty to use her own religion—a liberty which Knox and a few of the more extreme Reformers denounced as a sin against the law of God. She is said to have rejected the violent counsels of the Roman Catholics; it is certain that she surrounded herself with Protestant advisers, her chief minister being her illegitimate brother, James Stuart, an able if ambitious statesman, whom she soon afterwards created earl of Murray. Under his guidance, in the autumn of 1562, she made a progress to the n., which, whatever was its design, ended in the defeat and death of the earl of Huntly, the powerful chief of the Roman Catholic party in Scotland.

Meanwhile, the courts of Europe were busy with schemes for Mary's marriage. The king of Sweden, the king of Denmark, the king of France, the arch-duke Charles of Austria, Don Carlos of Spain, the duke of Ferrara, the duke of Nemours, the duke of Anjou, the Scottish earl of Arran, and the English earl of Leicester were proposed as candidates for her hand. Her own preference was for Don Carlos, the heir of what was then the greatest monarchy in Christendom; and it was not until all hopes of obtaining him were quenched, that she thought seriously of any other. Her choice fell, somewhat suddenly, on her cousin, Henry Stuart, Lord Darnley, son of the earl of Lennox, by his marriage with a granddaughter of king Henry II. of England. He was thus among the nearest heirs to the English crown, and his claims to the succession were believed to have the support of the great body of English Roman Catholics. But except this, and his good-looks, he had no other recommendation. He was weak, needy, insolent, and vicious; his religion, such as it was, was Roman Catholic; his house had few friends and many enemies in Scotland; and he was two or three years younger than Mary. Her best friends, both Roman Catholic and Protestant, warned her against him, but in vain. The marriage was celebrated at Holyrood on July 29, 1565. It was the signal for an insurrection by Murray and the Hamiltons, who hoped to be joined by the whole Protestant party. But their hope was disappointed; and the queen, taking the field in person, at once quelled the revolt, and chased the rebels beyond the Tweed.

Her triumph was scarcely over when her eyes began to open to the great mistake of her marriage. Her husband's worthlessness and folly became only too apparent; she was disgusted by his debauchery, and alarmed by his arrogance and ambition. She

had given him the title of king, but he now demanded that the crown should be secured to him for life, and that if the queen died without issue it should descend to his heirs. Mary hesitated to comply with a demand which would have set aside the settled order of succession; and what she refused to grant by favor, the king prepared to extort by force.

Mary's chief minister, since Murray's rebellion, had been David Rizzio, a mean-looking Italian of great ability and many accomplishments; but generally hated beyond the palace walls as a base-born foreigner, a court favorite, and a Roman Catholic. The king and Rizzio had been sworn friends, sharing the same table, and even sleeping in the same bed; but the king was now persuaded that it was Rizzio who was the real obstacle to his designs upon the crown. In this belief he entered into a formal compact with Murray, Ruthven, Morton, and other chiefs of the Protestant party, undertaking, on his part, to prevent their attainder, or procure their pardon, and to support and advance the Protestant religion; while they, on the other part, bound themselves to procure the settlement of the crown upon him and his heirs, and to take and slay, if need were, even in the queen's palace and presence, every one who opposed it. The result of this conspiracy was the murder of Rizzio on Mar. 9, 1566, the king leading the way into the queen's cabinet, and holding her in his grasp while the murderers dragged the poor Italian into an ante-chamber, and, mangling his body with more than 50 wounds, completed what they believed, and Knox pronounced to be, "a just act and most worthy of all praise." When Mary learned what had been done she broke out in reproaches against the king as to blame for all. "I shall be your wife no longer," she told him, "and shall never like well till I cause you have as sorrowful a heart as I have at this present." As had been agreed beforehand among the conspirators, Mary was kept prisoner in Holyrood; while the king, of his own authority, dismissed the parliament which was about to forfeit Murray and his associates in the late insurrection. The plot was thus far successful; but Mary no sooner perceived its objects than she set herself at work to defeat them. Dissembling her indignation at her husband's treachery and the savage outrage in which he was the ring-leader, she succeeded by her blandishments in detaching him from the conspirators, and in persuading him not only to escape with her from their power by a midnight flight to Dunbar, but to issue a proclamation in which he denied all complicity in their designs. The conspiracy was now at an end; Ruthven and Morton fled to England, while Murray, by renouncing their cause, hastened to make his peace with the queen; and the king, hated by both sides, because he had betrayed both sides, became an object of mingled abhorrence and contempt.

It was an aggravation of the murder of Rizzio that it was committed, if not in the queen's presence, at least within a few yards of her person, only three months before she gave birth (on June 19, 1566) to the prince who became king James VI. As that event drew near the queen's affection for her husband seemed to revive; but the change was only momentary; and before the boy's baptism, in December, her estrangement from the king was greater than ever. Divorce was openly discussed in her presence, and darker designs were not obscurely hinted at among her friends. The king, on his part, spoke of leaving the country; but before his preparations were completed he fell ill of the small-pox at Glasgow. This was about Jan. 9, 1567. On the 25th Mary went to see him, and traveling by easy stages brought him to Edinburgh on the 31st. He was lodged in a small mansion beside the kirk of the field, nearly on the spot where the s.e. corner of the university now stands. There Mary visited him daily, and slept for two nights in a room below his bed-chamber. She passed the evening of Sunday, Feb. 9, by his bedside, talking cheerfully and affectionately with him, although she is said to have dropped one remark which gave him uneasy forebodings—that it was much about that time twelvemonth that Rizzio was murdered. She left him between 10 and 11 o'clock to take part in a masque at Holyrood, at the marriage of a favorite valet. The festivities had not long ceased in the palace when, about two hours after midnight, the house in which the king slept was blown up by gunpowder; and his lifeless body was found in the neighboring garden.

The chief actor in this tragedy was undoubtedly James Hepburn, earl Bothwell, a needy, reckless, vainglorious, profligate noble, who, since Murray's revolt, and still more since Rizzio's murder, had enjoyed a large share of the queen's favor. But there were suspicions that the queen herself was not wholly ignorant of the plot, and these suspicions could not but be strengthened by what followed. On April 12 Bothwell was brought to a mock-trial and acquitted; on the 24th he intercepted the queen on her way from Linlithgow to Edinburgh, and carried her, with scarcely a show of resistance, to Dunbar. On May 7 he was divorced from the young and comely wife whom he had married little more than a twelvemonth before; on the 12th Mary publicly pardoned his seizure of her person, and created him duke of Orkney; and on the 15th—only three months after her husband's murder—she married the man whom every one regarded as his murderer.

This fatal step at once arrayed her nobles in arms against her. She was able to lead an army against them, but it melted away without striking a blow on the field of Carberry (June 15), when nothing was left to her but to abandon Bothwell and surrender herself to the confederated lords. They led her to Edinburgh, where the insults of the rabble and grief at parting with Bothwell threw her into such a frenzy that she refused

all nourishment, and rushing to the window of the room in which she was kept prisoner called for help, and showed herself to the people half-naked, with her hair hanging about her ears.

From Edinburgh, she was hurried to Loch Leven, where, July 24, she was prevailed upon to sign an act of abdication in favor of her son, who, five days afterwards, was crowned at Stirling. Escaping from her island prison May 2, 1568, she found herself in a few days at the head of an army of 6,000 men. On the 12th, it was met and defeated by the regent Murray at Langside, near Glasgow. Four days afterwards, in spite of the entreaties of her best friends, Mary crossed the Solway, and threw herself on the protection of queen Elizabeth, only to find herself a prisoner for life. From Carlisle, her first place of captivity, she was taken, in July, to Bolton; from Bolton, she was carried, in February, 1569, to Tutbury; from Tutbury, she passed in succession to Wingfield, to Coventry, to Chatsworth, to Sheffield, to Buxton, and to Chartley. She was removed, last of all, to Fotheringhay, in September, 1586, there to be tried on a charge of complicity in a plot against the life of Elizabeth. Sentence of death was pronounced against her Oct. 25; but it was not until Feb. 1, 1587, that Elizabeth took courage to sign the warrant of execution. It was carried into effect on the 8th, when Mary laid her head upon the block with the dignity of a queen and the constancy and resignation of a martyr. Five months afterwards, her body was buried with great pomp at Peterborough, whence, in 1612, it was removed to king Henry VII.'s chapel at Westminster, where it still lies in a sumptuous tomb erected by king James VI.

The character of Mary was long one of the most fiercely-vexed questions of history, and is still in debate, although the great preponderance of authority seems now to be on the side of those who believe in her criminal love for Bothwell and her guilty knowledge of his conspiracy against her husband's life. Her beauty and accomplishments have never been disputed. "She was confessed by every one"—says Mr. Joseph Robertson, one of the latest writers on her life—"she was confessed by every one to be the most charming princess of her time. Her large sharp features might perhaps have been thought handsome rather than beautiful, but for the winning vivacity and high joyous spirit which beamed through them. It has been questioned whether her eyes were hazel or dark gray, but there is no question as to their starlike brightness. Her complexion, although fresh and clear, would seem to have been without the brilliance so common among our island beauties. Her hair appears to have changed with her years from a ruddy yellow to auburn, and from auburn to dark brown or black, turning gray long before its time. Her bust was full and finely shaped, and she carried her large stately figure with majesty and grace. She showed to advantage on horseback, and still more in the dance. The charm of her soft, sweet voice is described as irresistible; and she sang well, accompanying herself on the harp, the virginals, and still oftener on the lute, which set off the beauty of her long, delicate, white hand. The consciousness how that hand was admired may have made it more diligent in knitting and in embroidery, in both of which she excelled. Her manner was sprightly, affable, kindly, frank perhaps to excess, if judged by the somewhat austere rule already beginning to prevail among her Scottish subjects. She spoke three or four languages, was well and variously informed, talked admirably, and wrote both in prose and in verse, always with ease, and sometimes with grace or vigor. In the ring of which she was the center, were statesmen like Murray and Lethington, soldiers like Kyrkcaldy of Grange, men of letters like Buchanan, Lesley, sir Richard Maitland, and sir James Melville. The first poet of France published verses deploring his absence from her brilliant court; Damville, the flower of French chivalry, repined at the fate which called him away from it so soon; Brantôme and the younger Scaliger delighted to speak, in old age, of the days which they passed beneath its roof."

Mary's prose-writings have been collected by the enthusiastic devotion of prince Alexander Labanoff, in his *Recueil des Lettres de Marie Stuart*. Setting aside the twelve sonnets which she is said to have written to Bothwell, and which survive only in a French version of an English translation, no more than six pieces of her poetry, containing in all less than 300 lines, are now known. They have no remarkable merit. The best is the poem of eleven stanzas on the death of her first husband, Francis II., printed by Brantôme. The longest is a *Meditation* of a hundred lines, written in 1572, and published two years afterwards by her ever faithful follower, bishop Lesley of Ross. All are in French, except one sonnet, which is in Italian. The sweetly simple lines beginning, "Adieu, plaisant pays de France," so often ascribed to her, are the work of A. G. Meusnier de Querlon, a French journalist, who died in 1780. A volume of French verse on the *Institution of a Prince*, which she wrote for the use of her son, has been lost since 1627, along with a Latin speech in vindication of learned women, which, when no more than thirteen, she delivered in the hall of the Louvre, in presence of the French court.

To enumerate all that has been written on Mary would fill a volume. Among the chief works are S. Jebb's *De Vita et Rebus Gestis Mariæ Scotorum Reginæ* (Lond. 1725, 2 vols. fol.); J. Anderson's *Collections Relating to the History of Mary, Queen of Scotland* (Lond. 1727–28, 4 vols. 4to); bishop Keith's *History of the Affairs of Church and State in Scotland* (Edin. 1734, fol.; 1844–1850, 3 vols. 8vo); W. Goodall's *Examination of the Letters said to be written by Mary, Queen of Scots, to James, Earl of Bothwell* (Edin. 1754, 2 vols. 8vo); Principal Robertson's *History of Scotland*; W. Tytler's *Inquiry into the Evi-*

dence against Mary, Queen of Scots (Edin. 1759, 8vo; Lond. 1790, 2 vols. 8vo); M. Laing's *History of Scotland;* G. Chalmers's *Life of Mary, Queen of Scots* (1818, 2 vols.; 1822, 3 vols.); P. F. Tytler's *History of Scotland;* Prince Labanoff's *Recueil des Lettres de Marie Stuart* (1844); David Laing's edition of *John Knox's History of the Reformation* (1846–48); Miss Agnes Strickland's *Lives of the Queens of Scotland* (Edin. 1850–59, 8 vols. 8vo); A. de Montaiglon's *Latin Themes of Mary Stuart* (Lond. 1855, 8vo); Prince Labanoff's *Notice sur la Collection des Portraits de Marie Stuart* (1856); M. Miguet's *Histoire de Marie Stuart* (1852), M Teulet's *Lettres de Marie Stuart* (1859); M. Cheruel's *Marie Stuart et Catherine de Medicis* (1858); Robertson's *Catalogues of the Jewels, Dresses, Furniture, Books, and Paintings of Mary, Queen of Scots* (1863); Hosack's *Mary, Queen of Scots, and her Accusers* (1870–74); *History of Mary Stuart, Queen of Scots,* translated from the MSS. of prof. Petit, by C. de Flandre (1874); *Marie Stuart: son Procès et son Exécution, d'après le Journal inédit de Bourgoing,* by Chantelauze (1876).

The best representations of Mary are the contemporary portraits by the French painter, Francis Clouet, more commonly called Jehannet or Janet, and the statue, by an unknown sculptor, on her tomb at Westminster. All portraits which cannot be reconciled with these types may safely be rejected as spurious.

MARYSVILLE, a city of California, U. S., on the north bank of the Yuba river, 100 m. n.n.e. of Benicia, and 50 m. n. of Sacramento, having steam-boat communication with San Francisco. It is a great resort of gold-miners, and has a variable population, given in the census of 1870 at 4738.

MARYSVILLE (*ante*), a city in n. California, incorporated 1851; at the confluence of the Yuba river and the navigable Feather river, opposite Yuba city with which it is connected by a bridge. It is at the junction of the Roseville to Redding division of the Central Pacific, and the Oroville to Marysville branch, and is the largest and most important city in the state n. of Sacramento; pop. '70, 4,738. It is 116 m. from San Francisco, and 70 m. by water from Sacramento, and being at the head of navigation, surrounded by fertile agricultural and rich mining districts, is the center of an important trade. It does an extensive commission business, and is engaged largely in manufactures. It is built, mostly of brick, on a level plain, and is regularly laid out with wide streets. It is supplied with water, lighted with gas, has 4 banks, 8 churches, a convent, graded public schools and 8 private institutions of learning, a masonic hall, a public library, 5 hotels, and manufactories of carriages, woolen mills, steam flour mills, breweries, and iron foundries

MARYVILLE, a t. in e. Tennessee, the present s. terminus of the Knoxville and Augusta railroad; pop. '70, 811. It is the seat of Maryville college, a Presbyterian institution, organized 1819, chartered 1842; open to both sexes, with a distinctive course of 4 years for ladies, and in '74, a library of 2,000 vols. The college buildings, 3 in number, costing $50,000, are pleasantly located on an estate of 65 acres. The Society of Friends have a school here called the Freedman's college. In the town are 7 churches, 1 newspaper, flour and saw mills, a tannery, and a manufactory of woolen goods.

MASACCIO, 1401-43; b. San Giovanni Val d'Arno, Florence, in the early part of the 15th century. His real name was Tommaso Guidi, but on account of his incapacity for the duties of life he was nicknamed at an early age Tommasaccho, shortened to *Masaccio,* or *Helpless Tom.* He received his first lessons in art from Masolino da Panicale. He was employed under him in painting the frescos in the Brancacci chapel at Florence. He studied the sculptures of Ghiberti and Donatello, and learned perspective from Brundleschi. About 1430 he visited Rome, where he executed several important works. In 1434, on the return of Cosmo de Medici from exile, he went back to Florence, and was engaged to complete the paintings of the Brancacci, left unfinished by the death of his master, Marsolino. When in Rome he painted in the church of St. Clemente a series of frescos from the life of St. Catharine. "By the easy posture of his figures, the simplicity and dignity of his draperies, and his natural and harmonious coloring," he surpassed all his contemporaries, and introduced a new era in the annals of painting. He had great readiness of invention and unusual truth and elegance of design, and was remarkably well-skilled in perspective. The frescos in the church of the Carmine at Florence were his masterpieces, and were carefully studied by Raphael and other great painters of the 15th and 16th centuries. In his epitaph, written by Annibal Cavo, it is said that Michael Angelo, who, as the teacher of other painters, was the pupil of Masaccio. His portrait by himself is in the national gallery. He was envied by his competitors, and some think that he was poisoned.

MASANIELLO (properly, TOMMASO ANIELLO), a fisherman of Amalfi, was the leader of the revolt which took place in Naples in July, 1647, against the Spanish viceroy, the duke of Arcos. The people had been exasperated by oppression, and great excitement had been produced by a new tax laid upon fruit. Masaniello himself was indignant at the rude treatment which his wife had received when she was detected in the attempt to smuggle a little flour. He entered into a conspiracy with some others who cherished feelings similar to his own; and an opportunity being afforded them by a tumult at the customs' houses on July 7, 1647, when the new tax on fruit was to be levied, they stirred up the multitude to a revolt. Their triumph was complete; palaces and public buildings

were destroyed, a bloody popular justice was executed, and the viceroy was terrified into the greatest concessions, and entered into a regular treaty with Masaniello in the church of the Carmelites on July 13. But success and the flatteries of the viceroy turned the fisherman's head; he gave himself up to drunkenness and every excess, and his capricious despotism immediately became terrible to his own associates, who assassinated him on July 16. See Angelo Saavedra, duke of Rivas, *Insurrection de Napoli en* 1647. (2 vols., Madr. 1849).

MASAY'A, one of the oldest towns of Nicaragua, Central America, close to a lake of the same name, 40 m. n.n.w. of Nicaragua city, and 8 m. from the n. shore of the lake of Nicaragua, near the volcano of Masaya—a broad, low mountain, about 3,500 ft. high, with one large and several minor craters. The last great eruption of this mountain was in 1670, when the lava spread in a northern direction to a distance of more than 20 miles. This great lava-field is said to resemble an ocean of ink suddenly congealed in a storm. In 1860 the mountain showed signs of renewed activity. The town is the center of a very fertile district, and has a pop. of 16,000, chiefly Indians, who are said to be thrifty and industrious.

MASCARA', a very old t. of Algeria, in the province of Oran, and 50 m. s.e. of the town of that name, on the slope of the Atlas mountains. Mascara was built by the Turks upon the site of a Roman colony. During the first years of the French occupation, it was a favorite residence of Abd-el-Kader, but was taken by the French in 1835. Pop. about 9,000, of whom more than a half are natives.

MASCARENE', JEAN PAUL, 1684-1760; b. at Castres, France, of a Huguenot family; educated at Geneva, and naturalized in England in 1706. Entering the army as lieut., he accompanied the British troops to Nova Scotia in 1711, and remained there nearly 50 years. He was a member of the council in 1720, and acted with the governors of Massachusetts and New Hampshire in negotiating the treaty of 1725 with the eastern Indians; was acting governor of Nova Scotia from 1740 to 1749; took part in the defense of the province against the French in 1744, and became maj.gen. in 1758. Died in Boston.

MASCARENE' ISLES, or MASCARENHAS, the collective name given to islands of Bourbon (q.v.), and of Isle-de-France or Mauritius (q.v.). The island of Rodriguez, 360 m. further e., is sometimes reckoned as one of them.

MAS'CLE (from *macula*, the mesh of a net), in heraldry, a lozenge-shaped figure perforated and showing a narrow border. The term *mascally* is applied to a field divided by diagonal lines into lozenge-shaped compartments of alternate tinctures, each having its center voided of the opposite tincture. *Lozengy-mascally* is a field composed of lozenges and mascles alternately. In the earlier heraldry, mascally was used for what was afterwards called lozengy. Crosses and other ordinaries may be formed of mascles, in which case they should begin with half a mascle.

MASCOU'TINS, an Indian tribe of the Algonquin family, very well known in the 17th c., and appearing constantly in the history of the early French settlers. Their habitat was the country about the northern lakes, and they were found on the Wisconsin and Fox rivers about 1669, and later on in the vicinity of the Ohio, in what is now Indiana. They appear to have been on friendly terms with the Kickapoos, Foxes, and Miamis, but quarreled with the Ottawas. In 1765 they attacked a party under the English col. Croghan on the Wabash river, and in 1777 endeavored to perform an act of treachery affecting col. Clarke, an American officer operating in their country. As early as 1712 they had united with the Kickapoos and Foxes against the French. Indeed, this tribe appears to have antagonized the whites from the time of the first settlement, inciting other tribes to join them in their warfare. By the Hurons the Mascoutins were called, in their own language, Asistaeronon, the "fire-nation;" but the name Mascoutin is said to mean prairie. Since the last century the Mascoutins have died out as a separate organization, and are not now known to the U. S. government as a tribe. It is, however, probable that they are still represented on some of the reservations.

MÂS-ĒNÂ, a t. of Negroland, Africa, capital of the country of Bagirmi, in lat. 11° 35′ n., long. 16° e., about 100 m. s.e. of lake Tchad. It covers an area 7 m. in circumference, and was formerly much larger. Its present reduced condition has been induced by disastrous civil and foreign wars. Only about half the area of the town is inhabited. The palace of the sultan, who is reported to have from 300 to 400 wives, consists of irregular clusters of clay buildings, and huts surrounded by a wall built of baked bricks. The town is walled, and has 9 gates. It has on the whole a dilapidated appearance.—Barth's *Travels in Central Africa.*

MASÈRES, or MAZÈRES, FRANCIS, an English mathematician, commonly called baron Masères; 1731–1824; b. London. His father was a physician, driven from France by the revocation of the edict of Nantes. The son was educated at Clare-Hall, Cambridge, taking the highest rank in the classics and mathematics. Having obtained a fellowship in the college, he removed to the Temple; was in due time admitted to the bar; was appointed attorney-general for Canada, and resided in Quebec till 1773. Returning to England he was appointed to the office of cursitor baron of the exchequer, which office he held till his death. He was also at different times deputy recorder of

London and senior judge of the sheriff's court. He published *Elements of Plane Trigonometry; Principles of the Doctrine of Life Annuities; Scriptores Logarithmici*, a collection, in 6 vols. quarto, of writings on the subject of logarithms, the works of Kepler, Napier, Snell, etc., being interspersed with original tracts on kindred subjects; *Scriptores Optici*, a reprint of the optical writings of James Gregory Descartes, Shooten, Huygens, Halley, and Barrow. He reprinted also a large number of tracts on English history. The expense of Hales's treatise on *Fluxions* was defrayed by him.

MASHAM, ABIGAIL, Lady, 1670–1734; b. London; daughter of a merchant named Francis Hill and Miss Jennings, an aunt of the duchess of Marlborough. Her father lost his fortune by speculation, and Abigail became waiting-woman to Lady Rivers. Soon after by the influence of the duchess of Marlborough, she was appointed a lady of the bedchamber to princess Anne. She became the confidant of the princess, and, after the latter became queen, did all she could to destroy the Marlborough influence at court. In 1707, Abigail was married, by consent of the queen, to Samuel Masham, a gentleman of the bedchamber to prince George of Denmark. This marriage brought about an open rupture with the Marlboroughs. The intrigues of Mrs. Masham finally resulted in the overthrow of the whigs, the elevation of Harley to power, and the dismissal of the duke of Marlborough. The high-church principles of Mrs. Masham recommended her from the first to Anne, who had been compelled to accept a whig government, but whose political sympathies lay with the tories. Mrs. Masham was engaged in plots to bring back the Stuarts; and she seems always to have used her position for her pecuniary advantage. Her husband was raised to the peerage in 1711. Lady Masham adhered to Bolingbroke in the quarrel between him and Oxford. After the death of queen Anne in 1714 she lived in retirement.

MASHE'NA, a t. of Bornu, central Africa, in lat. 13° 3′ n., long. 10° 2′ e., about 240 m. w. of lake Tchad. It lies on the gentle southern slope of an eminence, the top of which is crowned with a rocky crest, and is surrounded with a clay wall. According to Barth, it is a considerable place for this country, having a pop. of certainly not less than 10,000, but without the least sign of industry.

MASINISSA, or MASSINISSA, King of the Massylians; B.C. 239–148; a famous African prince, son of Gala. He was educated at Carthage, and in 213 B.C. induced his father to form a league with the Carthaginians. In the same year he sailed for Spain at the head of a troop of Numidian cavalry, and displayed great zeal and valor in the war against the Romans. But the defeat of the Carthaginians at Silpia in 206 B.C., and the generosity with which his nephew, Massiva, was treated by Scipio Africanus, led him to become a faithful ally of the Romans. The crown of his country, which, after the death of his father Gala, had passed in rapid succession to his uncle Œsacles, and his cousin Capusa, was seized at this time in the name of an infant brother of the latter by Mezetulus. On hearing of this usurpation, Masinissa crossed to Africa, defeated Mezetulus in a pitched battle, and forced him to flee into the kingdom of Syphax. The Carthaginians, however, irritated at his open avowal for the Romans, incited Syphax to make war upon him. Defeated and stripped of his sovereignty, he was compelled to seek refuge near the Syrtis minor, where he bravely defended himself until the arrival of Scipio in 204 B.C. He identified his cause with that of the Romans, and his knowledge of the habits of the enemy contributed greatly to the two victories gained over Hasdrubal and Syphax. He then, after a march of 15 days, captured Cirta, the capital of Syphax. In the decisive battle of Zama which followed the arrival of Hannibal in Africa (202 B.C.), he made a brilliant charge at the head of his Numidian horse, drove the cavalry of Hannibal from the field, and was, therefore, the first to turn the tide of battle against the Carthaginians. For this service he received the greater part of the kingdom of Syphax in the following year. He now profited by the leisure which peace afforded him, devoting his attention to the organization of his government and to the civilization of his semi-barbarous subjects. But his lust of conquest was never satiated, and in his ninetieth year he marched into the territories of Carthage. Although several of his chiefs had deserted him, he adroitly circumvented the enemy, and forced them to capitulate.

MASK (Med. Latin, *masca;* Fr. *masque*), a disguise or covering of the face, the use of which, perhaps, originated in the harvest festivities of the Grecian peasantry of the most ancient times, and appears subsequently to have been associated with the representation of Satyrs, Silenus, and Bacchus in the orgies of Bacchus. Greek tragedy having originated in close connection with the worship of Bacchus, masks were employed in it from the first; but it is uncertain when they were introduced in comedy. The masks used by actors were of very various form and character. They were often provided with metallic mouthpieces, for the purpose of increasing the power of the voice, this being rendered requisite by the immense size of the ancient theaters; their whole use being indeed adapted to such vast buildings, and to a style of dramatic representation in which the ideal prevailed, and the reality of individual impersonation was far less thought of than in modern times. Much information on the subject of ancient masks may be found in the work of Pacichelli, *De Mascheris, Capillamentis et Chirothecis* (Naples, 1693); in the magnificent work of Pietro Contucci Ficoroni, *De Larvis Scenicis et Figuris Comicis* (Rome, 1754), and in Berger's *De Personis vulgò Larvis seu Mascheris* (Frankf. 1723).

The use of masks in the modern theater originated in the Italian *commedia dell' arte*, which may itself be traced back to the ancient Roman mimes and pantomimes, and has always been confined to that class of entertainments in which the very names of the characters, *Pantaloon, Harlequin*, etc., have been borrowed from Italy.

MASK, MASKED, a military expression used in several senses. A *masked battery* is one so constructed, with a grassy glacis, etc., as to be hidden from the view of the enemy, until, to his surprise, it suddenly opens fire upon him—on his flank, perhaps. The fire of a battery is *masked* when some other work, or a body of friendly troops, intervenes in the line of fire, and precludes the use of the guns. A fortress or an army is masked when a superior force of the enemy holds it in check, while some hostile evolution is being carried out.

MASK, THE MAN WITH THE IRON. See IRON MASK, *ante*.

MASKELYNE, NEVIL, an English astronomer and physicist, was b. in London, Oct. 6, 1732. He was educated at Westminster school, whence he was removed to Catherine hall, and subsequently to Trinity college, Cambridge, where he obtained a fellowship in 1756. In 1758 he was elected a fellow of the royal society, and resolved to devote himself to astronomy. In 1763 he made a voyage to Barbadoes, to test the newly invented Harrison chronometers, and, after his return, was (1765) appointed astronomer-royal. During the 46 years that he held this situation, he acquired universal respect by his diligence and the accuracy of his investigations, made several improvements in the arrangements and employment of the instruments, and was the first to mark the time to tenths of a second. In 1744–46 he made his expedition to Schehallion, for the purpose of determining the density of the earth. See EARTH. Maskelyne was the means of originating the *Nautical Almanac* (q.v.), and also obtained leave to have his observations printed at the expense of government. He published very few works out of his official capacity, but of the others, no fewer than 35 appeared, many of which have been found of immense service (especially his *Astronomical Observations*) to subsequent astronomers. Maskelyne died Feb. 9, 1811.

MASKINONGÉ, a s.w. co. of Quebec, Dominion of Canada, having lake St. Peter on the s.e; 3,221 sq.m.; pop. '71, 15,079. It is watered by the Gatineau, Du Lièvre, Maskinongé, and Du Loup rivers. The population is nearly all of French extraction or origin. Capital, Rivière du Loup.

MASKS, in architecture, are carved as decorations on keystones and other prominent positions.

MASON, a co. of central Illinois, having the Illinois river on the n. and the Sangamon on the s.; 580 sq. m.; pop. '80, 16,244. It presents a surface of low prairie land, very fertile. Intersected by division of the Chicago and Alton, the Springfield and Northwestern, and the Peoria, Pekin and Jacksonville railroads. It produces very largely of Indian corn, wheat, oats, butter, hay, and potatoes. Co. seat, Havana.

MASON, a co. in n.e. Kentucky, having the Ohio river on the n.; drained by the n. fork of the Licking river, and Limestone and Lee's creeks; 236 sq.m.; pop. '80, 20,469. The surface toward the n. is hilly, elsewhere more level, the soil being generally fertile. Productions are wheat, oats, rye, barley, Indian corn, tobacco, wool, butter, and hay. There are some thriving manufacturing industries prosecuted, including agricultural implements, woolen and cotton goods, carriages, and wagons. Co. seat, Maysville.

MASON, a co. in w. Michigan, on lake Michigan; 460 sq.m.; pop. '70, 3,263; watered by the Great and Little Sable, the Marquette, and the Notipeskago rivers. It is characterized by a generally level surface, and very fertile soil. Productions are Indian corn, wheat, oats, potatoes, and hay. Co. seat, Pere Marquette.

MASON, a co. in w. central Texas, drained by branches of the Colorado, the Llano, and the San Saba; 910 sq.m.; pop. '80, 2,655. The surface is mostly fertile land, but a considerable portion of it is heavily wooded. Stock raising is the principal industry. Productions are Indian corn, hay, sweet potatoes, wool, and butter. Co. seat, Mason.

MASON, a co. in w. part of Washington territory, bounded on the e. by Puget sound; 1600 sq.m.; pop. '80, 639. It is crossed by the Olympus and Coast mountains, which are separated by broad valleys of very fertile land. The principal industry is lumbering, the farm products—oats, hay, and potatoes,—being unimportant. The sound makes up into the land at many points, forming inlets which are excellent harbors. Co. seat, Oakland.

MASON, a co. in the w. part of West Virginia, having the Ohio river on the n. and w., and intersected by the Great Kanawha river and its affluents; 300 sq.m.; pop. '80, 22,293. The surface varies in character, the soil being generally fertile. There are iron ore, coal, and salt springs. The productions are Indian corn, wheat, oats, potatoes, tobacco, wool, and hay. Co. seat, Point Pleasant.

MASON, ARMISTEAD THOMSON, 1787–1819; b. Va.; son of Stevens. He graduated at William and Mary college, and became a farmer. He served through the war of 1812 as col. of a cavalry regiment, distinguishing himself at the defense of Norfolk; and he was afterward made a brig.gen. in the Virginia militia. He was elected to the Virginia house of representatives and to the U. S. senate, from which he resigned in 1817

to become a candidate for the lower house of congress, hoping by means of his unbounded personal popularity to defeat the federalist candidate, Mercer. The election was bitterly contested; but Mercer was returned by a narrow majority. The campaign gave rise to a number of heated controversies and several duels; and Mason himself was killed in a duel by his own cousin, col. John Mason McCarty.

MASON, CHARLES, 1730–87; b. England, and long employed as an assistant at the Greenwich observatory; was sent with Jeremiah Dixon to the cape of Good Hope in 1761 to observe the transit of Venus. In 1763 the same gentlemen were employed by the proprietors of Maryland and Pennsylvania to survey the boundary line between their respective possessions; a task upon which they were engaged until Dec. 26, 1767. The boundary fixed by them has since been known as "Mason and Dixon's line" (q.v.). They also, at the request of the Royal society, fixed "the precise measure of a degree of latitude in America," for which service the society granted them £200. The particulars of this work are recorded in vol. lviii. of the society's *Transactions*. In the same volume may be found *Astronomical Observations made at the Forks of the Brandywine* for the purpose of "determining the going of a clock sent thither by the Royal society in order to find the difference of gravity between the observatory at Greenwich and the spot where the clock was set up in Pennsylvania." Mr. Mason recorded in his private journal a minute account of his proceedings in America, his haps and mishaps, as well as of his scientific observations on a great variety of subjects, with interesting notices of the Indians of various tribes whom he met on his route or who rendered assistance to him and his companions. He describes with enthusiasm the beauty and grandeur of American scenery, and gives a tolerably accurate account of the valley of the Mississippi, as received by him from an aged Indian chief. Mason and Dixon returned to England in the autumn of 1768. In the following year Mason went to Cavan, Ireland, to observe the transit of Venus, his report of which appeared in the *Philosophical Transactions* for 1770. He was also employed by the bureau of longitudes to verify the lunar tables of Tobias Mayer, in which he made some corrections. At an unknown date he returned to America, and died in Philadelphia in 1787. His private journal, field notes, etc., were found among a pile of waste paper in the cellar of the government-house at Halifax, Nova Scotia, in 1860, and an account of their contents was published by Porter C. Bliss in the *Historical Magazine* for July, 1861.

MASON, EBENEZER PORTER, 1819–40; b. Washington, Conn.; graduated at Yale in 1839. He was distinguished for his early proficiency in mathematical and astronomical studies, and shortly after his graduation was appointed a member of the commission for defining the boundary between Maine and Canada. Not long after this he published *Observations on Nebulæ*, a paper which was highly commended by Sir John Herschel. D. at Richmond, Va., a few days after attaining the age of 21 years. His *Life and Writings* were published by prof. Denison Olmsted.

MASON, ERSKINE, D.D., 1805–51; the youngest child of Dr. John Mitchell Mason; b. New York; graduated at Dickinson college, Carlisle, Penn., of which his father was then president; studied theology at Princeton seminary; was pastor of the Presbyterian church at Schenectady, N.Y., 1827–30; and of the Bleecker street church, New York city, 1830–51. He was stated clerk of the general assembly of the Presbyterian church, N.S., 1838–43; and acting professor of church history in the Union theological seminary, New York city. He ranked very high as an argumentative preacher, and drew many eminent men, both citizens and strangers, to listen to his eloquent appeals. A selection from his sermons, with a short memorial notice by his friend Dr. William Adams, was published soon after his death in a volume entitled *A Pastor's Legacy*.

MASON, FRANCIS, D.D., 1799–1874; b. York, Eng.; left the parish school to work at the trade of his father who was a shoemaker. While thus employed he happened to find a work on geography and astronomy, which led him to attend an evening-school where he learned algebra, geometry, and trigonometry. In 1818 he came to the United States and worked at his trade at various places at the West. In 1824 he went to Boston, and worked at Randolph and Canton, Mass. At Canton he married, joined the Baptist church, and studied languages with his pastor. In 1827 he studied at Newton theological seminary, and in 1830 was sent as a missionary to Burmah. His labors were chiefly among the Karens, among whom he had great success. In two dialects of their language he translated the Bible and other religious books, and conducted a seminary for the training of preachers and teachers. He published in 1852 a work on the natural productions of Burmah, pronounced by Dr. Hooker "the most valuable addition to the history of the fauna and flora of British Burmah." A second edition was published under the title of *Burmah: its People and Natural Productions*. He published also a grammar, chrestomathy, and vocabulary of the Pali, besides translations from the Burman, Pali, and Sanskrit; *Life of Ko-Thah-Byu, the Karen Apostle; A Memoir of Mrs. Helen M. Mason;* a *Memoir of San Quala, a Karen Convert; The Story of a Working-man's Life, with Sketches of Travel.*

MASON, GEORGE, a member of the English parliament in the reign of Charles I. He opposed the arbitrary policy of the king towards the colonies, but disapproved of extreme measures against him. He was an officer in the army of Charles II., and when

defeated at Worcester in 1651, he escaped in disguise to Virginia, losing all his possessions in England.

MASON, GEORGE, 1726–92; b. at Doeg's Neck, Fairfax co., Va.; a descendant of col. George Mason who was a member of the English parliament in the reign of Charles I.; settled in Truro parish; built Gunstan hall on the Potomac, and became the intimate friend of Washington, for whom he drafted the "non-importation resolutions," which were offered by Washington, and adopted by the Virginia assembly in 1769. One of these was that the Virginia planters should purchase no slaves imported after Nov. 1. of that year. At a meeting of the people of Fairfax, July 18, 1774, he offered 24 resolutions on questions at issue between Great Britian and the colonies, which were sanctioned by the Virginia convention in August, and reaffirmed by the continental congress in October of the same year. In 1775 he was a member of the Virginia convention. In May, 1776, he drafted the declaration of rights and the plan of government, which were adopted by a unanimous vote. He was a member of the continental convention in 1777, and of the constitutional convention in 1787, taking decided ground against all measures tending to perpetuate slavery. He disapproved of the proposed instrument and refused to sign it, declaring that it would "result in a monarchy or a tyrannical aristocracy." He was a member of the convention called to consider the federal constitution, and with Patrick Henry, opposed it, insisting on 20 alterations. Some of these were afterwards adopted by congress and the states. He was elected the first United States senator from Virginia, but declined. His statue stands with those of Washington, Jefferson, Henry, and other distinguished Virginians in front of the state capitol at Richmond.

MASON, JAMES MURRAY, 1798–1871, b. Va.; a grandson of George. He began the practice of law at Winchester, in 1820; and six years later took his seat in the Virginia legislature, to which he was twice re-elected. In 1837 he was elected to congress, but at the end of his term, he refused a re-nomination, and resumed the practice of his profession. In 1847 he was appointed to fill a vacancy in the U. S. senate, to which he was elected in 1849, and again in 1855. He occupied a conspicuous position in the senate, where he was for a number of years, chairman of the committee on foreign affairs. Among the important measures with which he was connected, may be mentioned the fugitive slave law of 1850, which was drawn up by him. He was an ardent secessionist, and was expelled from the senate in 1861. He was soon appointed a commissioner for the confederate states to England and France, and on Nov. 8, 1861, with his fellow commissioner John Slidell, was taken off the British mail steamer, *Trent*, by captain Charles Wilkes. He was imprisoned in fort Warren, Boston, till Jan. 2, 1862, when he was surrendered to the English government. During the remainder of the war, he lived for the most part in Paris, still representing the confederate government. At the close of the war, he came to Canada, and after spending three years there, went to Virginia.

MASON, JEREMIAH, LL.D., 1768–1848, b. Conn., son of Jeremiah Mason, a col. in the revolutionary war. He graduated at Yale, in 1788, and was called to the bar in 1791. He began the practice of his profession at Westmoreland, N. H., near Walpole, whither he removed in 1794. Three years later, he removed to Portsmouth, which was his home for the next 35 years. He was soon recognized as the head of his profession, in a state whose bar was then, and perhaps since, unequaled in this country, and which could number among its members Ezekiel and Daniel Webster, and Jeremiah Smith. He held the office of attorney general for the state in 1802, and was elected to the U. S. senate, in 1813. He became one of the foremost debaters in that body, his speech delivered in 1814, on the embargo, being especially powerful. But he was, before everything else, a great lawyer, and he soon tired of politics, and in 1817, resigned his seat in the senate, and resumed the practice of his profession. He afterwards served, for a number of terms in the New Hampshire legislature, where his service had little connection with politics, but was given largely to revising and codifying the state laws. It was he who framed for the legislature its report on the Virginia resolutions with regard to the repeal of the Missouri compromise, and the state enjoyed in many other directions the benefit of his legal learning and sagacity. But he felt the need of a larger field for the display of his talents, and in 1832, removed to Boston, where the Websters had long preceded him. He was employed in Boston upon many great cases, and maintained till his age compelled him to retire, the high reputation which he had won elsewhere. His was one of the most acute legal minds in America. He was a greater lawyer than Webster, however inferior to him in other respects; and Webster, who had abundant occasion to conceive a respect for Mason's abilities, while they were both engaged in the trial of causes at the New Hampshire bar, does not exaggerate in giving his estimate of Mason: "Of my own professional discipline and attainments, whatever they may be, I owe much to that close attention to the discharge of my duties, which I was compelled to pay for 9 successive years, from day to day, by Mr. Mason's efforts and arguments at the same bar." "The characteristics of his mind," he adds, "as I think, were real greatness, strength, and sagacity. He was great through sound sense and sound judgment."

MASON, JOHN, d. 1635; b. at Lynn Regis, Norfolk, England, and served in 1610 in the navy; in 1616 went to Newfoundland as governor of the colony, and in 1620 pub-

lished a description of the country, to which he added a map in 1626. He explored the New England coasts in 1617; in 1622 obtained a grant of a region called Mariana, now the n.e. part of Massachusetts; in the same year, in connection with sir Ferdinand Gorges, procured a patent for the province of Maine; and in 1623 sent a colony to the Piscataqua river. In 1624–29 he was treasurer and paymaster of the English armies in the Spanish war. In 1629 he obtained a patent for the New Hampshire colony, and with Gorges took one also for Laconia, a region including lake Champlain. He held various honorable positions in England, in 1635 being a judge in Hampshire and vice-admiral of New England. His rights in New Hampshire were sold in 1691 to governor Samuel Allen. Died in London in Dec., 1635.

MASON, JOHN, 1600–72, b. England; served under sir Thomas Fairfax in the Netherlands; emigrated in 1630 to Dorchester, Mass.; removed in 1635 to Connecticut, and aided in founding Windsor. A party of whites having been massacred by the Pequot Indians at Wethersfield in 1637, he was appointed by the general court to attack the Pequots at the mouth of the Pequot river. With a force of 90 English and 70 friendly Mohegans under Uncas, he landed, May 23, in Narragansett bay, near point Judith. Aided by 200 Narragansetts under Miantonomah he marched to the two principal forts of the Pequots near the Mystic river. Though nearly deserted by his frightened allies, he attacked the nearest fort, May 26, 1637, but, unable to dislodge the Indians, he set fire to their wigwams, the whites and their allies surrounding the forts to prevent escape. Between 600 and 700 Pequots perished, seven were captured, and seven escaped; two of the English were killed and twenty wounded. He then pursued the remnant of the Pequots toward New York, killed and captured many, distributing those that remained among the Mohegans and Narragansetts. The peace now secured with the Indians continued for 40 years. After the Pequot war Mason removed to Saybrook, at the request of the inhabitants, for the defense of the colony, and in 1659 removed to Norwich. He was a maj. of the colonial forces for 30 years, deputy-governor of Connecticut 1660–70, and a magistrate 1642–68. He prepared, at the request of the general court of Connecticut, an account of the Pequot war, which was reprinted by Increase Mather in 1677.

MASON, JOHN MITCHELL, D.D., 1770–1829; b. New York; graduated at Columbia college, 1789, and continued his studies at the university of Edinburgh; after his father's death in 1792 succeeded him as pastor of the Associate Reformed church (Presbyterian); in 1804 became professor of theology in a seminary of which he was one of the founders. In 1811 the trustees of Columbia college, in order to enjoy the benefit of his eminent talents, created for him the office of provost, which he filled until 1816, taking charge of the senior class, and giving new life to the lecture-room; from 1821 to 1824 he was president of Dickinson college at Carlisle, Penn., and during that time connected himself with the Presbyterian church. As a pulpit orator he had great power and fervor; his eloquence is one of the traditions of the city of New York. When Robert Hall heard him deliver his celebrated discourse on "Messiah's Throne," he is said to have exclaimed, "I can never preach again." His aspect was on a scale of grandeur corresponding to the majesty of the mind within. Tall, robust, straight, with a head modeled after neither Grecian nor Roman standards, yet combining the dignity of the one and the grace of the other; with an eye that shot fire, especially when under the excitement of earnest preaching, yet tender and tearful when the pathetic chord was touched; with a forehead broad and high, and a mouth expressive of decision, Dr. Mason stood before his audience a prince of pulpit orators.

MASON, JOHN Y., LL.D., 1799–1859; b. Va.; educated at the university of North Carolina, and admitted to the bar. After serving for a number of terms in the Virginia assembly, he entered congress in 1831, and remained till 1837, when he was appointed judge of the U. S. district court for Virginia. He continued to hold that office till 1844, when president Tyler made him secretary of the navy. He entered the cabinet of president Polk as attorney-general, but was transferred in 1846 to the department of state. In 1854 president Pierce made him minister to France, where he remained till his death.

MASON, LOWELL, 1792–1872; b. Mass.; commenced his musical career in Savannah, where he was appointed choir leader in 1812. In 1821 he published a volume entitled *Handel and Haydn Collection of Church Music*, which attracted considerable attention. He removed to Boston in 1827, and devoted himself to the instruction of classes in vocal music; introducing musical instruction into the public schools of Massachusetts; and securing the establishment of the Boston academy of music. He made numerous compilations of glee-books, text-books, collections for family and Sunday use, etc. In 1837 Dr. Mason visited Europe, to make himself thoroughly familiar with the continental methods of musical instruction. In 1855 he was made doctor of music by the university of New York, the first degree of that character conferred in America. His chief claim to distinction rests on his efforts to make vocal music popular among the masses and on his hymn tunes, several of which are in constant use by all denominations in the United States, and have in some instances been given by the severer musical criticism of the present day a rank scarcely less high than that accorded them by continuous popular favor.

MASON, RICHARD B., d. 1850; b. Va.; a grandson of George. He entered the army as a lieut. in 1817, was promoted to a captaincy in 1819, and served through the Black

Hawk war in the dragoons. He was made a col. in 1846 and was at the head of the American troops in California, of which he was for a time military and acting civil governor. In recognition of his services in the Mexican war, he was brevetted brig.gen., May 30, 1848.

MASON, STEVENS THOMSON, 1760–1803; b. Va.; a son of Thomson. He was educated at William and Mary college, but entered the American army, in which, while hardly 20 years of age, he held the rank of col.; and he was a gen. at its close. He served for a number of years in the Virginia house of delegates, and was a conspicuous member of the constitutional convention of 1788. From 1794 till his death, he was a member of the U. S. senate.

MASON, STEVENS THOMSON, 1811–43; b. Va.; grandson of Stevens Thomson. He received his education in Kentucky, where his father, gen. John T. Mason, had settled. In 1831 he was appointed secretary of the territory of Michigan, which had just been organized; and when its governor, Lewis Cass, entered Jackson's cabinet as secretary of war, Mason became acting governor of the territory. He continued to serve in this capacity during the dispute in regard to the proper boundary between Ohio and Michigan; and the final peaceful settlement of the controversy was, in no small degree, rendered possible by his tact and moderation. As soon as Michigan was erected into a state in 1835, Mason was unanimously chosen governor; and he was honored with a re-election, retiring in 1839. The last three years of his life were spent in New York, where he had begun to practice law.

MASON, THOMSON, 1730–85; b. Va.; a brother of George. He read law in the temple, London, after which he returned to Virginia, and made his home in Loudon county. He took a conspicuous part in the revolutionary movement in Virginia, and in 1774 published a series of papers, advocating resistance to the claims of England. In 1778 he was appointed to a seat upon the state supreme court, then just established, and soon after he served upon the commission to codify and revise the state laws. In 1779 and again in 1783, he was chosen a member of the state legislature.

MASON, WILLIAM, an English divine and poet; 1725–97; educated at Cambridge, and admitted fellow of Pembroke college in 1747; became rector of Aston in Yorkshire, and chaplain to the king; subsequently was for 32 years precentor and canon residentiary of the cathedral of York. He published a *monody* to the memory of Pope; *Isis*, an elegy; the dramatic poems of *Elfrida* and *Caractacus*. In 1756 he published a small collection of odes as an imitation of Gray. In 1763 he produced some fine elegies. He is considered in point of morality as the purest of poets, and one of the warmest friends of civil liberty. In 1772 was published the first book of a descriptive poem entitled *The English Garden;* and the remainder in 1781. In 1775 he published the poems of Gray, with a memoir of his life and writings prefixed; in 1783 an elegant translation of Dufresnoy's Latin poem on the art of printing, and *An Historical and Critical Essay on English Church Music.* In addition to his poetical reputation, he was skilled in painting and music. A tablet to his memory is placed in the poets' corner in Westminster abbey. A complete edition of his poems was published in York in 1771.

MASON, WILLIAM, b. Mass., 1829, son of Dr. Lowell Mason. He studied music in Europe with Hauptmann, Moscheles, and Liszt, and returned to America in 1854, after having appeared as a piano performer at Prague, Frankfort, Weimar, and London. His first concert in this country was given at Boston, which was followed by several very successful concert tours. He then settled in New York, devoting himself to teaching and composing. From 1855 to 1868 he played the piano in connection with the well-known string quartet composed of Theodore Thomas, Joseph Mosenthal, George Matska, and Carl Bergmann. In 1872 he received from Yale college the degree of doctor of music. He has held several prominent positions as organist, and many of his compositions have been republished in Europe.

MASON AND DIXON'S LINE, a line running along the parallel of lat. 39° 43′ 26.3″, and separating Pennsylvania from Maryland, drawn by two distinguished English astronomers and mathematicians, Charles Mason and Jeremiah Dixon. For about 80 years after 1681, there were constant dissensions between the lords Baltimore and the Penn family, the rival proprietors in Pennsylvania and Maryland, in regard to the position of the boundary-line between their colonial possessions. An agreement was come to in 1760, in accordance with which a party of surveyors commenced to make out the real boundary. The proprietors in London, not understanding the length of time required for such an undertaking, and growing impatient, sent out Mason and Dixon to complete the surveys, who commenced the work in Dec., 1763. They concluded their task towards the end of 1767, having marked out a line of 244 m. in length, passing through forests, over mountain ridges, etc. At the end of every fifth mile a stone was planted, on which was engraved on one side the arms of lord Baltimore, on the other those of the Penns. The intermediate miles were marked by smaller stones with an M on one side and a P on the other. All the stones came from England. The surveys were revised in 1849, and found substantially correct.

This line must be distinguished from that of 36° 30′, which separated the free and slave states of the original confederation. The latter is also the *compromise line,* which

in 1820 was fixed as the most northern limit of such slave states as should be admitted into the union.

MASON AND DIXON'S LINE (*ante*) originated in the difficulties which occurred in tracing the boundary line of a tract of land granted to William Penn in 1681. This land lay w. of the Delaware and n. of Maryland, and a part of its southern boundary was defined to be "a circle drawn at 12 m. distant from Newcastle northwards and westwards into the beginning of the 40° of northern latitude." Later, Penn received another grant, and, his agent being unable to agree with the authorities in America as to the just boundary, he came to this country himself in 1682 to establish his claim and take possession of his land. He was opposed by lord Baltimore, the matter was referred to the committee of trade and plantations, a change in the reigning monarch of England took place, and it was not until 1760 that the final deed was issued to the heirs of Penn, closing the controversy. But even then the question of surveying the disputed territory with a view of defining the boundary-line opened new disagreement; and it was to arrange this that Charles Mason and James Dixon, "mathematicians and surveyors," were mutually agreed upon by the contestants, Thomas and Richard Penn, on the one part, and lord Baltimore, the great-grandson of Cecilius, the first patentee, on the other, "to mark, run out, settle, fix, and determine all such parts of the circle, marks, lines, and boundaries as were mentioned in the several articles or commissions, and were not completed." The two surveyors commenced their work in 1764, and did not finish it until 1767; the delay being partly owing to Indian troubles, involving negotiations with the Six Nations in their settlement. The line, as finally drawn, has been popularly supposed to have been the dividing line between the free and the slave states; but this is an error, as slavery existed throughout Delaware, which is both e. and n. of the line, until abolished by the 14th amendment to the constitution. To this line is owing the peculiar tract of land known as the "pan-handle," where a part of Virginia runs up between Pennsylvania and the Ohio river.—Very little is known of the two "surveyors of London," as they were styled. Mason was an assistant of Dr. Bradley at the royal observatory at Greenwich; both were members of the American philosophical society; both were sent by the royal society to the cape of Good Hope to observe the transit of Venus in 1769. Dixon died in Durham, England, in 1777; and Mason died in Pennsylvania in 1787.

MASON BEE, a name given to those species of bee which build their nests of agglutinated earth or grains of sand. See BEE. *Megachile muraria* is a British species, black, the wings tinted with violet. The nest is attached to walls or stones in sunny places. The interior contains about a dozen cells, in each of which is deposited an egg, with a piece of paste for the food of the larva. These bees sometimes repair old nests, and have fierce combats for the possession of them.

MASONED, in heraldry, a term used to describe the lines formed by the junction of the stones in building.

MA'SONRY, the art of construction in stone. The earliest existing examples are among the most magnificent specimens of the art. No nation has excelled the ancient Egyptians in stonework, whether we consider the size of the materials, or the unequaled exactness with which they are fitted together. The Egyptians did not use mortar in their important structures, such as the pyramids, the joints being all carefully polished and fitted. Cyclopean masonry, of which remains exist in many parts of Greece and Italy, also exhibits stones of great size and with carefully-adjusted joints. The walls of Mycenæ are among the earliest examples. These are built with huge irregular blocks, the spaces between being filled up with smaller stones. The Etruscan specimens are more carefully executed; the stones are not squared, but they are all carefully fitted together. In some cases, the beds or horizontal joints are made level, and the upright joints left unsquared. No mortar is used in cyclopean masonry.

The masonry of the Greeks and Romans very closely resembled that of the present day: *Rubble-work* (*opus incertum*), in which the stones are not regularly coursed; *coursed-work*, where the joints are all level, and the stones of equal height; *ashlar*, resembling the latter, but built with larger stones all carefully dressed on the joints. Many of the Roman buildings in the eastern empire were constructed with blocks of enormous size, as at Baalbec, where some of the stones are 60 ft. in length. Ashlar-work is frequently used for the exterior surface of walls, the inside being "backed up" with rubble-work. This kind of work is sufficient for ordinary purposes; but where great strength is required, the whole thickness must be built with solid blocks. Ashlar-work is generally bedded in fine mortar, with one inch of oil-putty on the outer edge.

The early mediæval masonry was of very bad construction, being, in fact, little better than common rubble, with an occasional use of herring-bone work. The Normans improved upon this kind of work, but their masonry was also so bad that most of the towers built by them either fell or had to be taken down. The fall of the tower of Chichester cathedral, a few years ago, was occasioned by defective Norman masonry. The art gradually improved with the advance of Gothic architecture, and ashlar was reintroduced for all important works. The ashlar-work so constantly used in renaissance buildings, has lately given place to a more picturesque style of masonary called hammer-dressed and squared work—the money saved upon this cheaper work being

applied with good effect in improving the appearance of the doors, windows, and other prominent features of the buildings.

There is one very simple rule, too little attended to in modern masonry—viz., that all stones, at least when stratified, should be laid on their *natural bed*, for if set on edge, they are sure to scale off and decay under the influence of the weather.

Special materials sometimes produce special kinds of work; thus, in Norfolk and Suffolk, where large flints abound, the walls are often faced with these, split so as to form a clean face and good joints, and arranged in bands or panels between stonework or brickwork. In Aberdeenshire, where granite is the usual building material, ashlar-work is almost universal, large blocks being more easily obtained and dressed than smaller ones. Again, where rag-stone only can be got, it is frequently neatly used in a similar manner to the flint above described.

MASONS, FREE. The mason brotherhoods of the middle ages were organized incorporations, not substantially different in their nature from the other guilds, governed by rules of their own, and recruited from a body of apprentices who had undergone a period of probationary servitude. Fable and imagination have traced back the origin of free-masonry to the old Roman empire, the Pharaohs, the temple of Solomon, or even the times of the tower of Babel and of the ark of Noah. The masonic craft in reality sprang into being about the same time, and from the same set of causes, as other incorporated crafts; but a variety of circumstances combined to give it an importance and influence beyond the rest. Men skilled in the hewing and setting of stones were naturally prized in an eminently church-building age. Their vocation necessarily involved traveling from place to place in search of employment. Wherever a great church or cathedral was built, the local masons had to be reinforced by a large accession of craftsmen from other parts; and the masons from neighboring towns and districts flocked to the spot, and took part in the work, living in a camp of huts reared beside the building on which they were engaged, A master presided over the whole, and every tenth man was a warden having surveillance of the rest. A mason, therefore, after going through his apprenticeship and probations, could not settle down, like another craftsman, among his neighbors and acquaintances, but must travel from place to place to find employment; hence it became desirable or necessary to devise means by which a person once a member of the fraternity might be universally accepted as such, without requiring, wherever he went, to give fresh evidence of his skill, or having to undergo a renewed examination on his qualifications. In order to accomplish this end, and to enable a mason traveling to his work to claim the hospitality of his brother-masons on his way, a system of symbols was devised, in which every mason was initiated, and which he was bound to keep secret. This symbolism, invented for the convenience of intercourse between members of the same craft, is the sole shadow of foundation for the popular notion that the masonic brethren were in possession of secrets of vital importance, the knowledge of which had been from generation to generation confined to their own order. It has been supposed that the possession of the masonic secrets enabled the masons to design the great cathedrals of the 13th and 14th centuries, whereas it is now certain that during the purest ages of Gothic architecture, both in France and in England, the architects were not members of the masonic fraternity at all, but either laymen of skill and taste, uninitiated in the mysteries of mason-craft, or oftener bishops and abbots, The masons who worked from the architect's design were, at the same time, not the mere human machines that modern workmen too generally are, but men who, in carrying out an idea imparted to them, could stamp an individuality of their own on every stone. Architecture was then a progressive art, and the architect of every great church or cathedral had made himself acquainted with the works of his predecessors, and profited by experience, adopting their beauties, and shunning their defects. The nature of the advance which architecture was then making, has been compared by Mr. Fergusson to the advance with which we are familiar in the present day in ship-building and other useful arts. "Neither to the masons nor to their employers, nor to the abbé Suger, Maurice de Sully, Robert de Susarches, nor Fulbert de Chartres, is the whole merit to be ascribed, but to all classes of the French community carrying on steadily a combined movement towards a well-defined end." In Germany, however, the masons of the 14th c., who had attained a wonderful skill in carving and in constructing arches, overstepping their original functions, took to a great extent the office of architect into their own hands; and it is undeniable that the churches designed by German masons, though rich in the most exquisite workmanship, are not comparable, in the higher elements of beauty, to the works of non-masonic architects.

The epithet "free" was applied to the craft of masons in consequence of their being exempted by several papal bulls from the laws which regulated common laborers, and exonerated from various burdens thrown on the working-classes at large both in England and on the continent. Like all the other guilds, the masons were bound by their rules to the performance of specific religious duties; but a craft one of whose principal functions was church-building, was naturally under the more especial protection of the clergy. Yet a considerable time before the reformation, we find the jealousy of the church excited from time to time by the masonic brethren, partly in consequence of their assuming other functions besides those of mere builders. In England, an act, passed in the minority of Henry VI., at the instigation of Henry of Beaufort, cardinal of Winchester,

prohibited the masons from holding their wonted chapters and assemblies. But this act was never enforced; and Henry VI., on coming of age, himself countenanced the masons, and was a member of the fraternity. Henry VII. became their grand master in England.

The history of freemasonry has been overlaid with fiction and absurdity, partly from an exaggerated estimate of its importance in the development of architecture, and partly from a wish to connect mediæval masonry with the institution that passes under the same name in the present day. Modern (or so called "speculative") freemasonry is an innocent mystification unconnected either with the building craft or with architecture. It is of British origin, and dates from the 17th century. According to the peculiar phraseology of the masonic brethren, it is founded in the "practice of moral and social virtue;" its distinguishing characteristic is charity, in its most extended sense; and brotherly love, relief, and truth are inculcated by its precepts. Its real founders were Elias Ashmole and some of his literary friends, who amused themselves by devising a set of symbols, borrowed in part from the knights templar, between whom and the old masons an intimate relation is said to have subsisted, and in part from the Rosicrucians (q. v.). These symbols, which have since been adopted as the distinguishing badge of the brotherhood of "free and accepted masons," include the sun, the moon, the compasses, square, and triangle. A number of so-called degrees or grades of masonry with fantastic names were established and conferred on the members.* Charles II. and William III. were masons; and the appearance of a connection with operative masonry was kept up by the appointment of sir Christopher Wren to the office of grand master. The "lodges" of Scotland profess to trace their origin to the foreign masons who came to Scotland in 1150 to build Kilwinning abbey; those of England go still further back, to an assemblage of masons held by St. Alban, the proto-martyr, at York in 926; and the mother-lodges of York and Kilwinning were, with insignificant exceptions, the parents of all the several lodges erected in different parts of Great Britain. Toward the close of last century, it was in some quarters made a charge against freemasonry, that under its symbolism was concealed a dangerous conspiracy against all government and religion. The accusation was probably groundless enough as regards British freemasonry, and so little effect was produced by it, that, in an act passed in 1799 for the suppression of secret societies, an exception was made in favor of freemasons. On the continent, political intriguers may sometimes have availed themselves of the secrecy afforded by freemasonry to further their schemes. In 1717 a grand lodge was formed in London, with power to grant charters to other lodges. Under its sanction, the first edition of the constitutions of the fraternity was published. The grand lodge was for a length of time on an unfriendly footing with the lodge of York, in consequence of having introduced various innovations not approved of by the older lodge, and of having granted charters within the district which York claimed as its own. In 1742 the duke of Cumberland was elected grand master of the grand lodge; and on his death, George IV., then prince of Wales, succeeded to the office, which he continued to hold till he was appointed regent, when, it being considered unsuitable that he should longer exercise any personal superintendence, he took the title of grand patron. In 1813 an understanding and a union was brought about between the two rival lodges by their respective grand masters, the dukes of Kent and Sussex. The fraternity has since been managed by the "united grand lodge of ancient free and accepted masons of England," consisting of the grand master, with his deputy, grand wardens, and other officers, the provincial grand masters, and the masters and wardens of all regular lodges, with a certain number of stewards annually elected, who meet four times a year for the dispatch of business, besides which there is an annual masonic festival, at which every mason is entitled to attend. The grand lodge of England has at present above a thousand lodges under its protection, and has H.R.H. the prince of Wales as its grand master.

In Scotland the masons, when they were a real company of artificers, were, like other handicrafts, governed by wardens of districts appointed by the king. In 1598 a re-organization of the mason lodges was effected under William Schaw, principal warden and chief master of masons, who in the following year confirmed the three "heid lodges" in their ancient order of priority—Edinburgh first, Kilwinning second, and Stirling third. In 1736 the operative element in mason lodges having become absorbed in speculative masonry, the grand lodge of Scotland was instituted by the representatives of 34 lodges, by whom also William St. Clair of Roslin was elected grand master, on account of his ancestors' alleged ancient connection with the mason craft, as patrons and protectors. Priority was assigned to the lodges according to the antiquity of their written records. The lodge of Edinburgh (Mary's chapel) was placed first, and Kilwinning second. The lodge of Kilwinning did not formally object to this till 1744, when it withdrew from the grand lodge and resumed its independence. On relinquishing this position in 1807, it was re-admitted into the grand lodge by the title of Mother Kilwinning, with precedence over the other lodges, and the provincial grand mastership of Ayrshire rendered hereditary in its master. For the foregoing information, we are

* The three principal grades are apprentice, fellow-craft, and master-mason; there being peculiar ceremonies at the making of each; and it is only on attaining to the degree of master-mason that a brother enjoys the full benefits and privileges of the craft.

indebted to Lyon's *Freemasonry in Scotland*, published by Messrs. Blackwood & Sons (1873)—a work of acknowledged historical value on the subject of which it treats.

Besides granting charters of affiliation, the chief use of the grand lodge, whether of England or Scotland, consists in its acknowledged authority to enforce uniformity of ceremonial and other observances, and to settle all disputes that may arise within the lodges under its charge. The officers of the grand lodge are to a large extent delegates from the respective lodges; the delegation being in the form of proxy masters and wardens. As a source of revenue, for each member made by a lodge, a fee must be remitted to the grand lodge, whereupon a diploma of brotherhood will be issued.

Modern freemasonry spread from Britain to the continent, to America, and to India. It was introduced into France in 1725, Russia in 1731, and Germany in 1740. grand lodges now exist in France, Belgium, Netherlands, Denmark, Sweden and Norway, Prussia, Saxony, Hamburg, Switzerland, Italy, Portugal, Greece, Canada, Nova Scotia, and New Brunswick, in Central and South America, and in British Columbia. Lodges in connection with European grand bodies exist in India, Africa, China, Polynesia, Turkey, Palestine, West Indies, Australia, and New Zealand. There are about forty grand lodges in the United States. Freemasonry is prohibited in Austria, Poland, Russia, and Spain, and by the pope.

The deep symbolical meaning supposed to be couched under the jargon of the masonic fraternity is probably as apocryphal as the dangers of masonry to government and order. A set of pass-words and a peculiar grip of the hand enable the initiated to recognize each other, and give a zest to their convivial meetings; and if the institution possesses any practical utility, it is in its enabling a mason, in a place where he is a stranger, to make himself known to his brother-masons, and claim their protection and assistance.

MASONS, FREE (*ante*). The claims of freemasonry to origin in a period of remote antiquity have recently received a certain amount of support. In the process of making the necessary preparations for the removal of the Egyptian obelisk at Alexandria to its new site at New York, in 1880, certain discoveries were made which were alleged to have a distinct masonic reference. These discoveries included a number of objects masonic in character, and the fact that the foundations and position of the monolith had been established according to rules which form a part of the traditions of the order. In regard to this whole matter of antiquity, there is nothing in the traditions of the order so exceptionally remarkable as to make any special demand on our credulity. Men have been constituted after the same fashion from the beginning of time; and, given the same motive and the same or a similar environment and like opportunities, they may be assumed to act in the same way. The organization of the craft-guild in northern and central Europe as early as the 7th century is a sufficient illustration of the tendency to association among men, and particularly among the laboring or "craft" classes, to prove this. We know that among the Greeks, and Romans also, such association occurred in various directions, and there is no sound reason for disbelief in the possible combination of the architects and master-builders of Rome in the time of Numa Pompilius, as is claimed by the masons. Whether we are to accept the traditions which point to Solomon's temple, and refer to the times of the ancient Egyptians for the period of the foundation of the order, is a matter not of vital importance; though the same reasoning that answers in the case of Rome is equally sound in that of Egypt. Certainly when one contemplates the pyramids, Memphis, Thebes, Denderah, and the other ruins of marvelous structures built by the Egyptian masons and architects, there is nothing absurd in the supposition that then, as now, associated effort might have been concerned; and that the associations concerned might have organized on some such basis as is involved in the traditional history of freemasonry. The Roman colleges of builders are said to have been created by Numa Pompilius in 715 B.C. In 52 A.D. the corporations of constructors were established in Great Britain. In A.D. 290 Caransius, commander of the Roman fleet, is said to have renewed the ancient constitution and privileges of the Roman colleges, with a view to gaining the favor of the builders, who were a very powerful association: the architect Albanus, sent to Great Britain as an inspector of the constructors, or masons, is credited with having been the first Christian martyr in Britain, he having been beheaded for preaching the doctrine of Christ. His rank of inspector became later on that of grand master. At this period, which was in the latter part of the 3d c., the city of York contained the most important lodges or colleges of builders in Britain. In the 4th and 5th centuries corporations of artists and operatives, so called, were instituted in Great Britain, and manuscript copies of their statutes are said to be still in existence in certain of the French libraries. In 614 pope Boniface IV. conferred by diploma upon the masonic corporations the exclusive privilege of erecting all religious buildings and monuments, and made them free from all taxation. The civil wars of this period paralyzed the development of the masonic corporations, and they took refuge in the monasteries, which thus became the schools of architecture —sending forth such architects as St. Aloysius, bishop of Noyen; St. Ferol, of Limoges; Dalmac, bishop of Rhodes; and Agricola, of Chalons (659–700). In some of the Anglo-Saxon documents which still exist in the libraries of England the masonic fraternities are styled "freemasons." In 925 A.D Athelstan convoked all the masonic

lodges of Great Britain; the order was re-organized; and the city of York was established as the seat of the grand mastership: 34 years later the archbishop of Canterbury, St. Dunstan, was named grand master of the fraternity. In 1040 Edward the Confessor assumed the protectorate of the order; and in 1100 king Henry IV. accepted the grand mastership. In 1145 the freemasons from upper Normandy were called to the aid of the builders of the cathedral of Chartres, and were publicly blessed by the archbishop of Rouen; they made a triumphal entry into the city of Chartres. In 1250 the grand lodge of Cologne was instituted; and in 1275 a masonic congress was convoked to hasten the building of the cathedral of Strasburg. The monopoly granted by pope Boniface IV. was confirmed by diplomas issued by pope Nicholas III. in A.D. 1277; and these were again confirmed by pope Benedict III. in 1334. In 1360 Germany had five grand lodges, Cologne, Strasburg, Bern, Vienna, and Magdeburg, upon which were dependent the local lodges of France, Belgium, Hesse, Swabia, Thuringia, Switzerland, Franconia, Bavaria, Austria, Hungary, and Styria. In the 15th c. the assemblies of freemasons in England were suppressed by act of parliament, but a few years later Henry VI. was initiated into the fraternity, his example being followed by nearly all the gentlemen of his court. In 1452 a new constitution was compiled at Strasburg, and in 1459, '34, and '69 masonic congresses were held in Ratisbon and Spire. A grand lodge of master masons was held in London in 1502, presided over by the king, Henry VII., who laid the corner-stone of the chapel of Westminster which bears his name. A congress of masons was held at Basle in 1563, and at Strasburg in 1564; and in 1607 king James I. of England proclaimed himself protector of the freemasons. In 1663 a general assembly of English masons took place at York, and was presided over by king Charles II. In 1666, at the time of the great fire in London, there were but seven lodges of masons in the city; and in 1703 these had declined to four, though Sir Christopher Wren, the aged grand master, exhibited great zeal in endeavoring to foster the progress, and increase of the order. In France, in 1539, Francis I. suspended all the corporations of workmen, and freemasonry became extinguished in that country, not to be revived until 1721. It is claimed by the masons that this act of Francis I. resulted in the abandonment of the practice of Gothic architecture, and the substitution for it of the *renaissance* style, of which school were the architects Delorme and Bullant, who built the Tuileries in 1577; Lescot and Goryon, the architects of the Louvre, built in 1571; Blondel and Bullet, who constructed the gates of St. Denis and St. Martin, of Paris, between 1674 and 1686; Mansart, who built the palace of Versailles and the Invalides in 1700 and 1725; and J. Soufflot, who erected the Pantheon: none of these architects were freemasons. It was in the year 1703 that the English masons forming the lodge of St. Paul, having completed the erection of the cathedral, passed the resolution which opened the doors of the order to others than practical masons and builders. This resolution reads as follows: "Resolved, that the privilege of masonry shall no longer be confined to operative masons, but be free to men of all professions, provided that they are regularly approved and initiated into the fraternity." This important decision entirely changed the nature of the society, and transformed it into the body as we find it to-day. In 1717 the grand lodge of London was constituted, and put into execution the resolution of 1703: see MASONS, FREE, *ante*. In 1864 the three grand lodges of Great Britain controlled 109 provincial grand lodges, with 1597 operative lodges under their jurisdiction, which extended their connections to every part of the globe. Freemasonry was introduced into Denmark, in 1783; France, 1721; in Sweden, in 1736; Russia, in 1731; Belgium, 1721; Holland, 1725; Germany, 1737; Switzerland, 1737; Italy, 1729; Portugal, 1735; Spain, 1727. It is claimed that a lodge was established in Halifax, Nova Scotia, as early as 1750, the first in the British dominions in America; but this statement is not fully credited. Of the five provinces which comprise the dominion of Canada, Prince Edward Island alone has its lodges subject to the grand lodges of Great Britain. The first lodge in the New England colonies was opened in Boston in 1733. After the war of independence, grand lodges were organized in all the states. The statistics of the order in America showed the following membership in the different states in 1880, including also the British provinces, or Dominion of Canada, and New Mexico:

Alabama	7,925	Indiana	26,665	Montana	664	Quebec	2,873
Arkansas	8,293	Indian Territory	343	Nebraska	3,117	Rhode Island	4,327
British Columbia	312	Iowa	18,486	Nevada	1,508	South Carolina	6,531
California	12,281	Kansas	6,687	New Brunswick	2,317	Tennessee	17,053
Canada	17,418	Kentucky	18,038	New Hampshire	7,688	Texas	17,340
Colorado	1,569	Louisiana	5,456	New Jersey	12,084	Utah	370
Connecticut	14,968	Maine	19,252	New Mexico	169	Vermont	7,978
Dakota	281	Manitoba	324	New York	75,918	Virginia	9,930
Delaware	1,235	Maryland	5,349	North Carolina	11,471	Washington	902
Dist. of Columbia	2,701	Massachusetts	25,926	Nova Scotia	3,424	West Virginia	3,385
Florida	1,842	Michigan	25,624	Ohio	28,836	Wisconsin	10,703
Georgia	12,491	Minnesota	7,061	Oregon	2,514	Wyoming	300

Illinois	38,610	Missouri	24,296	Prince Ed. Island	566	Total	582,556

MASON WASP, *Odynerus murarius*, a species of wasp, which makes its nest by boring a cylindrical hole in hard sand, or even in the plaster of walls, on which an exudation from the mouth seems to act so as to soften it sufficiently. At the orifice an outer tube is constructed, sometimes two or three inches in length, of pellets formed in the

excavation. In the interior an egg is deposited with a number of little caterpillars ready for food of the larva when hatched.

MASO'RA, or MASSORETH. See MASSORA, *ante*.

MASOVIA, or MAZOVIA, a district of Poland, bounded n. by Plock, e. by Podlachia, s. by Sandomir, w. by Kalisch and Posen; 7,646 sq. miles. During the early period of the independence of Poland it was a duchy on both sides of the Vistula which flows through it. In 1815 it formed a palatinate in the Russian kingdom of Poland with Warsaw as its capital. It is now under Warsaw, which forms a distinct government.

MASQUE, a species of dramatic performance much in vogue in England towards the close of the 16th and the beginning of the 17th century. It was in fact, the favorite form of private theatricals at the time. The masque appears to have originated in the practice of introducing in any solemn or festive procession men wearing masks, who represented either imaginary or allegorical personages. At first it was simply an "acted pageant," as in the well-known progresses of queen Elizabeth; but gradually it expanded into a regular dramatic entertainment, and in the hands of men like Fletcher and Ben Jonson attained a high degree of literary beauty. Jonson's masques were represented at court and were greatly relished. The taste for this kind of amusement, however, died away in the reign of Charles I.; nevertheless, to the time of that monarch belongs the finest masque, and one of the most splendid poems ever written—the *Comus* of Milton (1634). See Masson's *Life of Milton* (vol. i. page 542, et. seq.).

MASQUERADE, or MASKED BALL, a festive meeting in which the host and guests assume fictitious characters, and disguise themselves more or less for the occasion, the name being derived from the use of the mask. The public *mummeries* of former times, Easter plays, festivals of fools, etc., which were frequent in most parts of Europe, but somewhat various in different countries, probably suggested the idea of the masquerade, which, however, was not open to all, according to the well-understood rules of these ancient amusements, but was limited to some select class, or to those who paid a certain sum for admission. Catharine de' Medici introduced the regular masquerade at the French court. It found its way to England in the reign of Henry VIII., but did not reach any of the courts of Germany till the end of the 17th century. The *bal costumé* is a very modified and much less objectionable form of the masquerade. During the carnival, public masquerades are held in all the theaters and dancing-saloons of Paris, and on these occasions scenes of the most disgraceful profligacy are said to be enacted in spite of the strict supervision of the police.

MASS (Lat. *Missa*), the name given in the Roman Catholic church to the eucharistic service which in that church, as well as in the Greek and other oriental churches, is held to be the sacrifice of the new law, a real though unbloody offering, in which Christ is the victim, in substance the same with the sacrifice of the cross, and instituted as a commemoration of that sacrifice, and as a means of applying its merits, through all ages, for the sanctification of men. The doctrine of the mass, as understood by Roman Catholics, presupposes the eucharist, although the latter doctrine does not necessarily involve the notion of a sacrifice, and may even be held by those who deny the sacrificial character of the eucharistic rite. The arguments for and against this belief, on which the mass is founded, do not fall within our province, which limits us to a brief history and explanation of the rite as it is found among Catholics and the members of other communions in which it is observed. Without entering into discussions as to the primitive character of the eucharistic rite, it will be enough to observe that the very earliest records of Christian history, whether in the Acts of the Apostles, the canonical Epistles, or the writings of the most ancient of the fathers, plainly evince the existence from the beginning of a rite, which it is impossible not to regard as in its general character identical with that which still constitutes in most Christian communities the chiefest and most solemn part of their public worship. This rite is believed by Roman Catholics to have been partly a sacrifice, partly a communion and participation thereof by the faithful; and of the names by which it is called in the works of the early fathers, some—as for example, *agape*, and *hagia synaxis*, refer to the latter, while others—as *thusia*, *prosphorē*, *hiereion*—indicate the former signification. The etymology of the name now in use is somewhat obscure, but it is commonly referred to the proclamation made by the deacon at the close of the service—"*Ite; missa est*" ("Go; the assembly is dismissed"). By primitive use the communion of the faithful appears always, unless in exceptional cases, to have formed part of the eucharistic service; but afterwards it came to pass that the officiating priest only communicated, whence arose, especially in the Western church, the practice of "private masses," which has been in later times a ground of complaint with dissentients from Rome, even those who in other respects approach closely to the Roman doctrine. In the ancient writers a distinction is made between the "mass of the catechumens" and the "mass of the faithful"; the former including all the preparatory prayers, the latter all that directly regards the consecration of the elements and the communion, at which the "discipline of the secret" forbade the presence of the catechumens. With the cessation of this discipline, the distinction of names has ceased, but the distinction of parts is still preserved, the mass of the catechumens comprising all the first part of the mass as far as

"the preface." The mass is now, in general, denominated according to the solemnity of the accompanying ceremonial, a "low mass," a "chanted mass," or a "high mass." In the first a single priest simply *reads* the service, attended by one or more acolytes or clerks. The second form differs only in this, that the service is *chanted* instead of being *read* by the priest. In the high mass, the service is chanted in part by the priest, in part by the deacon and sub-deacon, by whom, as well as by several ministers of inferior rank, the priest is assisted. In all these, however, the service, as regards the form of prayer, is the same. It consists of (1) an introductory prayer composed of the 41st Psalm, together with the "general confession"; (2), the introit, which is followed by the thrice-repeated petition, "Lord, have mercy," "Christ, have mercy," and the hymn, "Glory to God on High"; (3), the collect, or public and joint prayers of priest and people, followed by a lesson either from the Epistles or some book of the Old Testament, and by the gradual (q.v.); (4), the gospel, which is commonly followed by the Nicene creed; (5), the offertory (q.v.), after the reading of which comes the preparatory offering of the bread and wine, and the washing of the priest's hands in token of purity of heart, and the "secret," a prayer read in a low voice by the priest; (6), the preface, concluding with the trisagion or "thrice holy"—at which point, by the primitive use, the catechumens and penitents retired from the church; (7), the "canon," which is always the same, and which contains all the prayers connected with the consecration, the elevation, the breaking, and the communion of the host and of the chalice, as also the commemorations both of the living and of the dead; (8), the "communion," which is a short scriptural prayer, usually appropriate to the particular festival; (9), the "post-communion," which, like the collect, was a joint prayer of priest and people, and is read or sung aloud; (10), the dismissal with the benediction, and finally, the first chapter of St. John's gospel. Great part of the above prayers are fixed, and form what is called the "ordo" or "ordinary" of the mass. The rest, which is called the "proper of the mass," differs for different occasions; some masses being "of the season," as of lent, advent, passion-tide, "quarter-time," etc., others, of "mysteries," as of the nativity, the circumcision, the resurrection; others again, of saints, as of an apostle, a martyr, or a confessor; others again, "votive," as "of the passion," "of the dead," "for peace," etc. In all these various classes, as well as in the individual masses under each, the "proper" portions of the mass differ according to the occasion, and in some of them certain portions of the "ordinary," as the "Glory to God on High," the "gradual," or the "Nicene creed" are omitted. On one day in the year, Good-Friday, is celebrated what is called the "mass of the presanctified," in which no consecration takes place, but in which the priest communicates of the host which was consecrated on the preceding day. This usage is found also in the Greek church, not alone on Good-Friday, but on every day during the lent, except Saturday and Sunday. In the celebration of mass the priest wears peculiar vestments, five in number—two of linen, called "amice" and "alb"; and three of silk or precious stuffs, called "maniple," "stole," and "chasuble," the alb being girt with a cincture of flaxen or silken cord. The color of these vestments varies with the occasion, five colors being employed on different occasions—white, red, green, purple or violet, and black, and they are often richly embroidered with silk or thread of the precious metals, and occasionally with precious stones. The priest is required to celebrate the mass fasting, and, unless by special dispensation, is only permitted to offer it once in the day, except on Christmas day, when three masses may be celebrated.

In the Greek and oriental churches the eucharistic service, called in Greek *theia leitourgia* (the divine liturgy), differs in the order of its parts, in the wording of most of its prayers, and in its accompanying ceremonial from the mass of the Latin church (see LITURGY); but the only differences which have any importance as bearing upon doctrine are their use of leavened bread instead of unleavened; their more frequent celebration of the "mass of the presanctified," to which reference has already been made; the Latin use of private masses, in which the priest alone communicates; and, in general, the much more frequent celebration of the mass in the Latin church. The sacred vestments, too, of the Greek and eastern rites differ notably from those of the Latin; and in some of the former—as, for example, the Armenian—a veil is drawn before the altar during that part of the service in which the consecration takes place, which is only withdrawn at the time of the communion. The service sometimes used on shipboard, and improperly called *missa sicca* (dry mass), consists simply of the reading of the prayers of the mass, but without any consecration of the elements. It was resorted to with a view to avoiding the danger of spilling the sacred elements, owing to the unsteady motion of the ship. It is sometimes also called *missa nautica* (ship mass).

MAS'SA, a t. in the province of Carrara-Massa, central Italy; pop. '74, 18,031. It is on the Frigida, and commands a fine prospect of the sea on the w., and of picturesque and fruitful hills on the n.e. The climate is almost unrivaled in Italy for mildness and salubrity. The oldest part of the town is on a hill; the newest part, with its fine buildings and spacious streets and squares, on the plain below. Among the buildings is a national palace, a noble structure, built by the princes of the house of Cybo. The history of the town is traced back to the 9th century. It was then and for a long time subject to the republic of Lucca, but in the 15th c. the Cybo family became its feudal lords.

MASSAC, a co in s. Illinois; has the Ohio river for its s. boundary, separating it from Kentucky; 230 sq.m.; pop. '80, 10,443—9,900 of American birth, 1703 colored. Forests of oak, elm, maple, ash, hickory, and the tulip tree diversify its surface, and the cypress grows luxuriantly in its swamps. An under-stratum of carboniferous limestone is the foundation of the soil, which, in land not subject to overflow, is fertile, and produces a large yield annually of tobacco, sweet-potatoes, butter, honey, and sorghum, and all varieties of grain and fruit. Cattle, sheep, and swine are raised, and the vine is cultivated to some extent. Its mineral products are coal and lead. Among its industries are the manufacture of wagon materials, tobacco, and snuff. It has flouring mills, potteries, and ship-yards on the Ohio river. Seat of justice, Metropolis.

MASSACHUSETTS, one of the 13 original states of the American union, and oldest of the New England states, lies between lat. 41° 15'—42° 53' n., and long. 69° 56'—73° 32' w., being 160 m. from e. to w., and from 47 to 110 from n. to s., with an area of 7,800 sq.m.; it lies s. of Vermont and New Hampshire, and borders on the Atlantic. There are 14 counties, and the chief towns are Boston, the capital, Lowell, Lawrence, Salem, New Bedford, Fall River, Lynn, Springfield, Cambridge, and Worcester. On the south-eastern coast are the islands of Nantucket and Martha's Vineyard. The principal rivers are the Connecticut, Merrimac, and Housatonic, which afford water-power to many manufacturing cities and villages. The country is hilly, and much of the soil sterile, but in the river-valleys it is fertile. The most important mineral products are granite and syenite, sand for glass, and iron. The chief agricultural products are Indian corn, apples and pears, grass and hay; but the manufactures are very large and various. In 1870 there were 194 cotton-mills, producing goods to the value of $59,679,153, and 182 woolen-mills, producing goods worth $39,489,242, besides numerous carpet-mills, iron-foundries, rolling-mills, nail factories, and machine shops. The manufacture of boots and shoes for the same year was $88,399,583. There are 60 railway companies, and in 1878 above 2,000 m. of railway were open. The fisheries of Massachusetts have long been one of its leading industries. There are over 200 national banks, about 180 savings-banks, numerous asylums, etc. Massachusetts has about 6,000 schools, a university, and 7 colleges; and in 1878 there were 345 newspapers and periodicals. The state income for 1877-78 was $7,244,900; the debt in 1878 was $33,020,000. Massachusetts was discovered by the Cabots in 1497. In 1614 it was visited by capt. John Smith. In 1620 the *Mayflower*, 180 tons, sailed from Southampton with 102 Puritan settlers, and landed at Plymouth, Mass., Dec. 22. Half died from cold and hardship the first year. In 1637 the colony suffered from Indian massacres; and in king Philip's war, 1675, 12 towns and 600 houses were burned. The war of the revolution of 1776 began in Massachusetts with the battles of Lexington and Bunker Hill. Pop. '10, 472,040; '60, 1,231,065; '70, 1,459,351; '75, 1,651,652.

MASSACHUSETTS (*ante*). There is reason to believe that portions of south-eastern Massachusetts, including the islands of Nantucket and Martha's Vineyard, were discovered by the Norsemen not far from 1000 A.D., and that various settlements were made in the next 300 years, none of which, however, gained permanence. In 1497 John and Sebastian Cabot again discovered the Massachusetts coast, and the English claimed it on that account. In 1602 Bartholomew Gosnold and 22 English colonists made a settlement on the Elizabeth islands, between Buzzard's bay and Vineyard sound, now constituting the township of Gosnold in Dukes co.; but it was in a short time abandoned. There were other expeditions to the coast in subsequent years, but the Plymouth colony was the first that proved successful. On Sept. 6, 1620 (O. S.), this colony, composed of about 100 English, who had sought exemption from religious persecution in Holland, having embarked from Delft Haven, set sail from Plymouth, England, in the *Mayflower*, of 180 tons, to find a home in America. On Nov. 9 they reached cape Cod, and anchored in the roadstead off Provincetown. An exploring party was sent in search of a suitable place to found a settlement, and the colonists landed at Plymouth, Dec. 22 (N. S.). Before landing they drew up and subscribed a compact or frame of government for the new settlement, and elected John Carver governor for one year. In four months nearly one-half the colonists died from exposure to the cold and the lack of wholesome food. Shortly after landing they entered into a treaty of peace with the Indian chief Massasoit and his tribe, which remained unbroken for a long time. Through the influence of capt. Miles Standish the disputes with other tribes were soon settled. In the spring of 1621 the *Mayflower* returned to England, and soon afterwards governor Carver died and was succeeded by William Bradford, with Isaac Allerton as assistant. During the next two years the colonists endured many privations, but in 1623 they were relieved by a bountiful harvest. The plan of property in common, which they adopted at first, was now abandoned. In 1622 a Mr. Weston, of London, who had been connected with the Plymouth colonists, obtained a patent and founded a new settlement in Wessagussett, now Weymouth. The Plymouth colony failed to obtain a patent, and was forced to carry on its government independently of the royal sanction. This they did, however, with perfect success, upon a plan not unworthy of the democracy of a later time, since the right of the people to govern themselves was fully recognized. In 1628 an expedition, organized by an English company, and commanded by John Endicott, landed at Salem. The company had obtained a grant of the territory lying between the

Atlantic and Pacific, and extending to a point 3 m. s. of the river Charles and 3 m. n. of the river Merrimac. After persistent efforts a royal patent was obtained for "the company of the Massachusetts bay," and the associates were constituted a body politic, with a governor, deputy, and 18 assistants, to be annually elected, and a general assembly of the freemen, with legislative powers, to meet four times in a year, or oftener if necessary. In 1629 the colony was reinforced, and the government and patent of the company were transferred from London to New England. The old officers resigned, giving place to others chosen from among those who were about to emigrate, John Winthrop being elected governor. From this time the colony grew rapidly, receiving an accession at one time of about 1000 persons, who came over in 17 vessels. Charlestown, Boston, Watertown, Dorchester, Roxbury, Mystic, Salem, Saugus (Lynn), and other places were at this period selected as sites for settlements. The colony for a time endured great hardships, losing many of its members by death, while others returned in discouragement to England. But new emigrants came to take the places of the departed, and still the colony grew. A spirit of religious intolerance, which was characteristic of all parties in those times, and which was partly the product of the bitter persecutions from which the colonists had fled, manifested itself in the banishment of Roger Williams and Anne Hutchinson, and a general persecution of the Quakers. Some disputes between the magistrates and people as to their respective powers, caused no little commotion. At first the colonists were allowed to manage their affairs without the interference of the home government; but at length they were suspected by the crown of a design to make themselves independent, and an attempt was made to annul their charter, a commission for their government being formed with archbishop Laud at its head. An order was issued to the colony to surrender its charter, but the settlers found a way to avoid a compliance, and measures were adopted to fortify Boston, Charlestown, and Dorchester against a possible assault. The colonists found their best protection, however, in the political agitations of the mother country, which so absorbed the attention of the government that it had no time to prosecute its schemes in America. The restoration of the Stuarts created fresh troubles for the colony, but at length, in 1662, the king confirmed the charter and made a conditional promise of amnesty for past political offenses. He insisted, however, upon his right to interfere in the affairs of the colony, demanded the repeal of all laws derogatory to his authority, required the complete toleration of the church of England, the taking of an oath of allegiance, and the administration of justice in his name. To these demands some of the colonists were disposed to yield for the sake of peace, while others steadily resisted them. Commissioners were sent over from England to investigate the affairs of the colony, but, being unable to accomplish anything, they were finally recalled. In 1643 the colonies of Massachusetts Bay, Plymouth, Connecticut, and New Haven entered into an alliance for mutual protection, which lasted 20 years and was superseded by a still closer confederation. In 1675 king Philip's war broke out, lasting more than a year, and subjecting the colonists to great loss of life and property. No less than 12 or 13 towns were destroyed by the Indians, 600 houses were burned, one in 20 of the men of the colony were killed on the field, and a debt of $500,000—an enormous sum for that day—was incurred. The troubles with the king continued; Massachusetts lost her jurisdiction over New Hampshire, and retained possession of Maine only by purchase. In 1684 the difficulties with the crown being still unsettled, the charter was declared forfeited. Joseph Dudley was appointed president of Massachusetts, the general court was dissolved, and a royal commission superseded the government under the charter. In 1686 Dudley was superseded by sir Edmund Andros, whose arbitrary proceedings have left a blot upon his name. In 1689 the men of Boston, aided by others from the country, rose in arms against him, put him and others in prison, reinstated the former magistrates, and restored the general court to its authority. Plymouth joined in the revolt, imprisoning the agent of Andros, and reinstating the former governor. A new charter, uniting the Massachusetts and Plymouth colonies, was granted in 1692. Under this charter the governor, lieutenant-governor, and secretary were appointed by the king. Sir William Phips was the first governor, and it was at about this period that the witchcraft delusion which had long held sway in Europe, broke out in the colony, blotting its history with a record of superstition and blood. It is to the honor of Massachusetts, however, that it so soon awoke from this inherited delusion; long after the evil had been exposed and forsaken here, the courts of European countries were still sentencing "witches" to death. There were fresh troubles with the Indians, which did not terminate till 1725.

Massachusetts was deeply involved in the struggles between England and France for ascendency in the new world, which did not finally cease until the union of Canada to England and of Louisiana to Spain in 1763. Then followed the controversies with England, which led step by step to the war of the revolution, which ended in the recognition of the United States as an independent nation. In these controversies Massachusetts bore a leading part, as she did in the war itself, and in laying the foundations of the new republic. The British government imposed the most onerous taxes upon the colonists, and sought to collect them by force, in the face of the most earnest remonstrances. The colonists at length refused to submit to exactions which they regarded as subversive of the fundamental principles of English liberty. They insisted that they could not be justly taxed while they were excluded from representation in parliament, and upon this issue

they were willing, if necessary, to go to war. The commerce of the colony, moreover, was hampered by the most arbitrary and irritating restrictions. The spirit of liberty, which the colonists had brought with them from their old home, had been developed in their self-governing church and state until, in the hearts of their children, it had grown too strong to be subdued, and found expression in every form of indignant remonstrance—till at last blows were substituted for words. The other colonies were appealed to—and not in vain—for sympathy and support. The first blood in this contest was shed in the Boston massacre, a street riot in 1770; next came the destruction of the tea in Boston harbor in 1773, the opposition to the port bill in 1774, the representation of the colony in the general congress, the seizure of the arsenal at Charlestown, etc., and finally in April, 1775, the bloody contest at Lexington and Concord, which was the actual opening of war.

The surface of the state is mostly uneven, and in some places rough and mountainous. Two separate ranges of the Green mountains, the Taghkanic and the Hoosic, enter the western part of the state from the n., and, with their outlying hills, present some of the most picturesque scenery to be found in New England. The Taghkanic is the highest and most westerly of these ranges, its principal elevations being Saddle mountain, or Greylock, 3,505 ft., and Mt. Everett, 2,624 ft. in height. The Hoosic range, in its highest part, does not rise above 1600 feet. Near the western bank of Connecticut river are several isolated peaks, Mt. Tom and Sugarloaf being the most prominent, while on the eastern side of the river, near South Hadley, stands Mt. Holyoke, in solitary beauty, commanding an extensive and lovely prospect. Another isolated mountain is the Wachusett, in Princeton, near the center of the state, which has an elevation of 2,018 feet. That portion of the Connecticut valley which lies within the boundaries of the state is remarkable for beauty of scenery and fertility of soil. The eastern portion of the state is less broken; some of it, including cape Cod, is level and sandy. The Connecticut river runs through the state from n. to s. for more than 50 miles. About one-third of the state lies westward of this river. The Housatonic, still further w., rises in the Green mountains on the n. border, and flows s. through Connecticut to Long Island sound. The Hoosic, one of the tributaries of the Hudson, rises in the n.w. corner of the state, but soon passes beyond its limits. The principal western tributaries of the Connecticut are the Westfield and Deerfield rivers, which are of considerable size; while the tributaries of the same streams from the e. are Miller's and Chicopee rivers. The Merrimac, which rises in New Hampshire, flows 35 m. to its mouth through the n.e. corner of the state, receiving on the way the Nashua and Concord rivers, and furnishing immense water-power for the great manufacturing towns, Lowell, Lawrence, Haverhill, etc. The rivers at the e. portion of the state are the Charles, on whose banks are Newton, Cambridge, and other large towns, and at whose mouth lies the city of Boston; the Blackstone, with almost unlimited water-power, and whose charming valley is lined with a cordon of manufacturing villages; and the Taunton, with its numerous branches. There are in the state many lakes and ponds, some of which are of unrivaled beauty, but none of them large enough to be useful for navigation. The coast is indented with numerous bays, large and small, and dotted with islands, some of which are of considerable size. The principal bays or sounds are Buzzard's, with many inlets and harbors, Vineyard, Edgartown, Nantucket, Cape Cod, Wellfleet, Duxbury, Massachusetts, Lynn, Nahant, Marblehead, Salem, Beverly, Gloucester, and Annisquam. The harbor of New Bedford, on Buzzard's bay, is, next to that of Boston, the best in the state. The principal islands are Nantucket, Martha's Vineyard, and the Elizabeth group of 16 off cape Cod.

The minerals of the state have not thus far been a source of much profit. In Bristol and Plymouth counties are deposits of anthracite, but of a very poor quality. In some places in the Connecticut valley are veins of lead, copper, and zinc, but not in quantities to justify working. Beds of iron ore in the Housatonic valley have been worked for many years, and the disintegrated quartz beds yield glass-sand of the finest quality. In 1874 deposits of silver, lead, and gold were discovered in Essex county, near Newburyport, the working of which has not thus far proved profitable. In some portions of the Connecticut valley are found extensive fossil footprints of birds and other animals, some of which must have been of gigantic size. The valleys of the principal streams are productive, but the other portions of the state can be made so only by enrichment.

Wild animals have been nearly exterminated. Bears, wolves, panthers, wildcats, and deer, formerly plentiful, are now almost never seen. Squirrels, rabbits, and game-birds are numerous. Owls, hawks, gulls, wild-ducks, and a great variety of song-birds are common. Reptiles exist in considerable variety, but few of them are venomous. The edible fish on the coast are abundant, embracing cod, halibut, mackerel, haddock, bass, and many other species.

The climate on the coast is variable, with prevailing e. winds, especially in the spring and early summer. In the interior it is more equable, and in the mountainous regions the winters are very cold. The mean annual temperature is about 48°.

Of the whole area of the state less than one-half is improved. In 1870 the number of farms was 26,500, embracing 1,736,221 acres of improved land, 706,714 acres of woodland, and 287,348 acres of other land unimproved. The cash value of farms was $116,432,784; of farming implements and machinery, $5,000,879; wages paid during the year,

$5,821,032; total estimated value of all farm products, $32,192,378; of orchard products, $939,854; of produce of market-gardens, $1,980,321; of forest products, $1,616,818; of home manufactures, $79,378; of animals slaughtered or sold for slaughter, $4,324,658; of all live stock on farms, $17,049,228. The chief productions were: Wheat, 34,648 bush., about one-half of which was spring and the other half winter; rye, 239,227 bush.; corn, 1,397,807 bush.; oats, 797,664 bush.; barley, 133,071 bush.; buckwheat, 58,049 bush.; peas and beans, 24,690 bush.; potatoes, 3,026,363 bush.; hay, 597,455 tons; tobacco, 7,312,885 lbs.; wool, 306,659 lbs.; butter, 6,559,161 lbs.; cheese, 2,245,873 lbs.; hops, 69,910 lbs.; maple sugar, 399,800 lbs.; honey, 25,299 lbs.; milk sold, 15,284,057 gallons. Horses on farms, 41,039; horses not on farms, 45,227; milch cows, 114,771; working oxen, 24,430; other cattle on farms, 78,851; neat cattle not on farms, 52,263; sheep, 78,560; swine, 49,178.

In proportion to the population the mechanical industries of Massachusetts exceed those of any other state. The latest statistics now accessible (Jan., 1881) are those of the state census of 1875. Whole number of manufacturing establishments, 10,915; total value of buildings, $80,997,503; value of average stock on hand, $89,061,506; value of machinery, $73,434,914; total capital invested, $267,074,802; number of persons occupied in manufacturing and mechanical employments, 316,459, of whom 233,252, were males and 83,207 were females. Of the males, 228,469, and of the females, 77,238, were above 15 years of age. The average yearly wages of both sexes and all ages was $475.76. Total amount of wages for the year, $126,711,583. The leading industries of the state, aside from agriculture and commerce, with the amount of their products respectively, as reported by the census of 1870, were as follows: Agricultural implements, $1,033,590; bleaching and dyeing, $22,250,429; boots and shoes, $88,399,583; carpentering and building, $12,429,739; clothing, $21,724,020; cotton goods, $56,257,580; cotton thread, twine, and yarn, $3,009,543; cutlery, $6,215,325; drugs and chemicals, $1,617,904; fisheries (exclusive of whale), $1,800,399; flouring and grist-mill products, $9,720,374; furniture, $11,369,148; glass, including cut and window, $2,552,000; hardware, $2,515,429; hats and caps, $3,416,191; hosiery, $3,213,481; india rubber and elastic goods, $3,183,218; iron, forged and rolled, $6,699,907; iron nails and spikes, $5,986,144; wrought iron pipe, $1,407,000; iron castings, including stoves and hollow ware, $7,046,702; tanned leather, $9,984,497; leather curried, $19,211,330; morocco, tanned and curried, $3,158,020; lumber, planed and sawed, $6,651,670; machinery of all kinds, $16,426,742; marble and stone work, $2,178,450; molasses and sugar refined, $7,665,485; musical instruments, $3,906,179; oil (fish and linseed), $3,581,786; paper of all kinds, $13,687,481; printing cotton and woolen goods, $17,325,150; printing and publishing of all kinds, $8,390,976; ship-building and repairing, $2,070,201; shovels and spades, $1,820,526; stone, $1,294,148; straw goods, $4,869,514; tin, copper, and iron ware, $2,785,674; upholstery, $2,424,457; watches, $1,281,160; wire, $2,854,672; woolen goods, $39,489,242; worsted goods, $8,280,541; mining and quarrying, $1,493,522; fisheries, $6,215,325.

The foreign and domestic commerce of Massachusetts is varied and extensive. The imports in 1874 amounted to $52,737,280; foreign exports, $2,280,772; domestic exports, $28,455,515. Vessels entered during the year at the several ports, 3,066, aggregating 783,541 tons; cleared, 2,982, aggregating 708,048 tons; registered, 2,563, aggregating 458,373 tons. The number of vessels entered in the coastwise trade was 2,655, of 2,167,386 tons; cleared, 2,700, of 2,191,829 tons. Vessels engaged in the general fisheries, entered at Newburyport, 105, of 3,677 tons; cleared, 116, of 3,922 tons. The most important centers of the fishing trade are Gloucester and New Bedford, the former unsurpassed for the magnitude of its cod and mackerel fisheries, the latter the leading market for the products of the whale. The product of the American whale fisheries for the year ending June 30, 1874 (nearly all from Massachusetts), amounted to $2,291,896, including sperm oil valued at $1,250,987; other whale oil, $775,919; and whalebone, $264,990. The number of vessels in the state engaged in the whale fisheries was 170; in the cod and mackerel fisheries, 1026, of 49,578 tons. According to the census of 1870, more than half the products of the fisheries of the United States (exclusive of the whale fisheries) were the fruits of Massachusetts enterprise and industry. The capital invested in the business was $4,287,871; number of persons employed, 8,993; value of products, $6,215,325. The number of vessels built in the state in 1874 was 77, of 31,499 tons, including 5 steamers of 689 tons.

The rivers of Massachusetts are not navigable to any considerable extent, but a network of railways, extending to almost every part of the state, offers unbounded facilities for trade and travel. Trunk lines lead from Boston in every direction, and branches extend to or near a vast number of the smaller towns, so that by far the greatest number of inhabitants outside of that city may, if they wish, leave their homes in the morning, go there and transact business, and return the same evening. The oldest of the roads (that between Boston and Lowell, 25 m.) was opened for use in 1835. In 1874 the number of miles of railway in operation in the state was 1782. More than one-fourth of the main lines are laid with steel rails. There are over 60 corporations, but, owing to the combinations between different lines, 31 boards of direction control all the roads. The average cost of these roads per mile was nearly $57,000; the cost of equipment about $7,700 per mile. One of the lines, extending through the state in a n.w. direction from Boston,

passes through Hoosac mountain by means of a tunnel 4¾ m. in length, costing over $14,000,000, for which the state lent its credit. The aggregate capital stock of the 63 companies in 1876 was $118,170,201; amount of their indebtedness, $52,914,825; gross income, $30,008,513; net income, $9,344,088. All the roads are under the supervision of a board of railroad commissioners appointed by the state, and wielding large powers. The board settles disputed questions between the different roads and between the roads and the public. It is compelled to hear and investigate all complaints against the roads, and find out and recommend a remedy, and its supervisory powers extend to the care of accounts, the examination of tracks, bridges, etc., and the investigation of accidents. In 10 years the cost of this supervision was one-twentieth part of one per cent of the gross receipts of the roads.

The number of national banks in the state in 1874 was 220, with a capital of $93,039,350; circulation outstanding, $59,051,019. In 1876 there were 176 savings-banks, with deposits amounting to $244,596,614; number of depositors, over 700,000. There were also 4 loan and trust companies, with $1,700,000 of capital, and $6,924,270 of deposits. The number of fire and marine insurance companies was 124, with $52,197,870 of capital, and net assets aggregating $6,924,270. The number of life insurance companies in 1874 was 6, 4 of them mutual. The assets of the 6 companies amounted to $25,218,611, their total liabilities to $22,291,740, their total income to $6,749,854; amount insured by existing policies, $132,951,879, of which $630,000 was reinsured.

The population of Massachusetts 1790 was 378,787; 1810, 472,040; 1830, 610,408; 1850, 994,514; 1860, 1,231,066; 1870, 1,457,351, of whom 703,779 were males, 753,572 females, and 13,947 colored; while 579,844 were engaged in agriculture, 131,291 in professional and personal services, 83,078 in trade and transportation, and 292,665 in manufacturing and mechanical employments. Pop. '80, 1,783,012.

Massachusetts has always taken high rank in educational affairs. The school statistics of 1876–77 are: Number of public schools, 5,556; number of children between 5 and 15, 296,375; number in the schools, 307,832; number of male teachers, 1176; of female teachers, 7,544; teachers who have attended normal schools, 1898; average term of the schools, 8 months and 15 days; average monthly wages of male teachers, $82.22; of female teachers, $34.20; amount raised by taxation for the support of schools, $4,331,675; income of funds appropriated at the option of the towns for the same object, $59,229; amount of local school funds, $1,898,891; income of local school funds, $119,968; income of state school fund, $76,320; amount expended in building and repairing school-houses, 956,483; number of high-schools, 216; number of incorporated academies, 44; average number of academy scholars, 3,939; number of private schools and academies, 385; evening schools, 92; total annual cost of public education, $5,582,519. There are 5 normal schools, one each at Framingham, Westfield, Bridgewater, Salem, and Worcester, and a normal art school in Boston. Total annual appropriation of the state for normal instruction, $76,000. The state school fund amounts to $2,067,581; the Todd normal school fund to $12,100; the agricultural college fund to $360,067. The institutions for collegiate and scientific instruction are numerous and of a high order of excellence. The oldest of these is Harvard college at Cambridge, founded in the infancy of the colony in 1636. The others, in the order of their organization, are: Williams college (Congregational), Williamstown; Amherst college (Congregational), Amherst; college of the Holy Cross (Roman Catholic), Worcester; Tufts college (Universalist), Medford; Boston college; Boston university (Methodist Episcopal); Mount Holyoke seminary for girls (Congregational), South Hadley; Sophia Smith college for women, Northampton; Wellesley college for women, Needham. The theological institutions are: Andover theological seminary, Andover, Congregational; Newton theological institution, Newton, Baptist; Harvard divinity school, Unitarian; New Church theological school, Waltham; Boston university school of theology, unsectarian (under Methodist auspices); Episcopal theological school, Cambridge; Tufts college divinity school, Universalist. There are 2 law schools, that of Harvard college and that of the Boston university. The schools of medicine are 6 in number, viz.: Boston university school, Harvard medical school, New England female medical college, Boston dental college, Harvard dental school, Massachusetts college of pharmacy. The schools of science are 4 in number, viz.: Massachusetts agricultural college at Amherst, Massachusetts institute of technology in Boston, Lawrence scientific school at Cambridge, Worcester county free institute of industrial science. The number of professors and instructors in all these institutions in 1874 was 421, of students, 3,331; value of grounds and buildings, $4,062,760; amount of endowments, $8,314,173; income from productive funds, $469,675; aggregate number of volumes in libraries, 337,132.

The institutions for special classes are as follows: Clark institution for deaf mutes, Northampton; Boston school for deaf mutes; Perkins institution and Massachusetts asylum for the blind, Boston; Massachusetts school for idiotic and feeble-minded youth, Boston; institution for education of feeble-minded youth, Barre; Hillside school, Fayville. The state provides for the deaf and dumb also at the American asylum for the deaf and dumb, Hartford, Conn. The reformatory, industrial and truant schools are as follows: State reform school, Westboro; state industrial school, Lancaster; Massachusetts infant asylum, Brookline; state primary school, Monson; Boston house of reformation; Lowell house of reformation; Plummer farm school, Salem; industrial school, Lawrence;

truant school, Cambridge; truant school, Worcester; temporary asylum for discharged female prisoners, Dedham. There are institutions for the insane at Worcester (2), Taunton, Northampton, Somerville, South Boston, Ipswich, and Danvers, and almshouses at Tewksbury and Bridgewater. There are three state-prisons, one at Charlestown, one at Concord, and one for women (under the care of women) at Sherborn; also one state workhouse, and 15 houses of correction. The whole number of commitments to all the prisons (including county jails) in 1874 was 20,752, of whom 16,656 were males, and 4,096 females.

According to the census of 1870 the number of libraries in the state, of all classes, was 3,169, of which 1,544 were public. The public libraries contained 2,010,609, and the private 1,007,204 volumes. There is reason to believe that these figures, too small at the time, might safely be doubled in amount now.

In 1875 the number of newspapers and periodicals in the state was 341, including 26 dailies, 222 weeklies, and 58 monthlies, with an aggregate circulation of 141,774,382 copies annually. According to the census of 1870 there were in the state 1848 religious congregations, 1764 church edifices, and $24,488,285 of church property. The principal denominations, in order of members, are as follows:—Congregational, Methodist, Baptist, Roman Catholic, Unitarian, Episcopal, Universalist, Christian, Friend, Spiritualist, Freewill Baptist, Swedenborgian, Presbyterian. The number of church-members was 5,020.

The state debt, Jan. 1, 1879, was $33,020,464; debts of cities and towns in 1878, $68,864,685. The cash value of real estate in 1874 was $1,289,308,763; of personal personal property, $542,292,402; total taxes, state, county, city, town, and highway, $28,700,605; number of dwellings in the state, 249,738.

The constitution is in substance that of 1780, with amendments adopted at different periods since. The governor, with the other principal executive officers, is elected annually by the people, and has a salary of $5,000. A council composed of 8 members elected annually by districts, gives him advice upon matters of official duty. The legislative power is vested in a general court, composed of a senate of 40 members and a house of representatives of 240 members, elected respectively by senatorial and representative districts. The councilors are paid $5 for each day's attendance, and $2 for every 10 miles' travel. Senators and representatives are paid at the same rate, and $1 for every 5 miles' travel from their homes. The election occurs annually, on the Tuesday following the first Monday in November, and the general court or legislature meets on the first Wednesday in January. The supreme judicial court consists of a chief-justice (salary, $5,500), and five associate justices (salary, $5,000 each). The superior court consists of a chief-justice (salary, $4,500), and nine associate justices (salary, $4,000 each). The judges of both these courts are appointed by the governor, with the advice and consent of the council, and hold office during good behavior. Slavery in Massachusetts was judiciously abolished at an early day, by the operation of a clause in the bill of rights of 1780.

In 1786 occurred the revolt known as "Shays's rebellion," in the western part of the state. It was occasioned by the poverty of the people after the revolutionary war, which made them impatient under taxation, and was soon suppressed, though not without some loss of life.

A survey has been made for a ship canal across Cape Cod, and the work of making it has already been commenced. When completed it will greatly shorten the distance by sea between Boston and New York, and enable masters of vessels to avoid some of the worst perils of the voyage as at present conducted.

The electoral votes of Massachusetts for president and vice-president of the United States have been cast as follows:—1789, 10 for Washington and Adams; 1792, 16 for Washington and Adams; 1796, 16 for John Adams for president, and 13 for Pinckney; 2 for S. Johnston, and 1 for Oliver Ellsworth for vice-president; 1800, 16 for Adams and Pinckney; 1804, 19 for Jefferson and George Clinton; 1808, 19 for C. C. Pinckney and Rufus King; 1812, 22 for George Clinton for President, and 20 for Jared Ingersoll and 2 for Elbridge Gerry for vice-president; 1816, 22 for Rufus King and John E. Howard; 1820, 15 for Monroe for president, and 8 for R. Stockton and 7 for D. D. Tompkins for vice-president; 1824, 15 for Adams and Calhoun; 1828, 15 for Adams and Rush; 1832, 14 for Clay and Sargeant; 1836, 14 for Webster and Francis Granger; 1840, 14 for Harrison and Tyler; 1844, 12 for Clay and Frelinghuysen; 1848, 12 for Taylor and Fillmore; 1852, 13 for Scott and Graham; 1856, 13 for Fremont and Dayton; 1860, 13 for Lincoln and Hamlin; 1864, 12 for Lincoln and Johnson; 1868, 12 for Grant and Colfax; 1872, 13 for Grant and Wilson; 1876, 13 for Hayes and Wheeler; 1880, 13 for Garfield and Arthur.

MASSACHUSETTS AGRICULTURAL COLLEGE, at Amherst, Mass., was opened for students in 1867. Its endowment was derived from the public lands appropriated for the purpose by act of congress in 1862, and the faith of the state is pledged for its maintenance and support. The endowment is estimated at $360,000, and the annual income is $16,000. The college possesses a farm of 400 acres, on which the various buildings, embracing extensive dormitories, laboratory, chapel, professors' houses, museum, conservatories, etc., are centrally located. The real estate is valued at $200,000.

and the personal property of the farm at $6,000. The laboratory is extensive and fully equipped, and the natural history collection is very fine The library contains 2,500 volumes. Number of professors in 1880, 6; of students, 100; of alumni, 160 It is specifically an agricultural college, and not connected with any other institution. Its course of study extends over a period of four years, and the graduates receive the degree of B S. It has special courses to accommodate those who desire to pursue scientific studies related to agriculture, but are unable to spare time from the farm to take a full course The number of such, to whom certificates have been given on leaving, is 500. Every student is required to practice military tactics and drill three hours per week, and is taught the science and art of war by a government officer, who is a graduate of West Point. All students are required to labor six hours weekly on the farm, at the barn, in the orchards, vineyards, nurseries, or conservatories, for instruction in those departments, and wages are paid to those who desire to labor in order to earn the means for procuring an education There is a post-graduate course for students who desire to become candidates for the degree of PH D.

MASSACHUSETTS BAY, an indentation on the eastern coast of Massachusetts, between cape Cod and cape Ann, 70 m. long and 25 m. wide, but including in its irregular form Plymouth bay, Cape Cod bay, and several others, with numerous small islands.

MASSACHUSETTS INDIANS. The Plymouth colonists, on their settlement in Massachusetts bay, found that part of the country populated by tribes of the Algonquin family, one of the three great aboriginal races of red-men that inhabited the basin of the St. Lawrence, and a tract of country as far south as that portion settled by the Pilgrims. These tribes were five in number, the Massachusetts and Nausets, on Massachusetts bay and cape Cod; the Nipmucks, or Nipnets, who dwelt in the central part of the colony which is now the state of Massachusetts; the Pennacooks, who extended north into New Hampshire; and the Pokanokets, or Wampanoags, who occupied the south-eastern part, and whose chief was the celebrated Massasoit. The new settlers speedily entered into friendly relations with these tribes, and as early as 1644 the Mayhews of Martha's Vineyard (q.v.), and in 1646 John Eliot had undertaken missionary labors among them. See ELIOT, JOHN. These efforts bore fruit, and in 1674 there were 600 converted Indians in Plymouth colony, 1500 in Martha's Vineyard, and 1100 in the Massachusetts bay colony. But though thus successful in conversion, the settlers had not been equally so in their general relations with the Indians, and in 1675 an irritated condition which had been gradually growing among the latter, culminated in the outbreak which has become known as king Philip's war This trouble originated with Philip Metacomet, son and successor of Massasoit, under whom the Pokanokets or Wampanoags rose, and were joined by the Nipmucks, Narragansetts, and Pennacooks, until a general Indian war had ravaged all the settlements. In this situation not even the new religious faith which had been instilled into the natives acted as a preventive, and the converted Indians joined with the rest in a general onslaught upon the whites. The struggle lasted a year, and only ended with the death of Philip, Aug. 12, 1676. The Pennacooks retired northward, and the other tribes submitted; but it is on record that numbers of those who were captured were exported to the West Indies as slaves. From this time the Massachusetts Indians followed the general course of their race, dying out, or retiring before the white man, or assimilating with the latter or with the negroes In 1861 a census showed the Indian and half-breed population of the state to be 1610, of whom 306 were on Martha's Vineyard, at Christiantown and Gayhead; 438 at Mashpee and elsewhere on cape Cod; and the remainder scattered. The United States census of 1870 made return of only 150 Indians in the state of Massachusetts, so had the process of reduction, or of assimilation, progressed in nine years.

MASSACHUSETTS INSTITUTE OF TECHNOLOGY, in Boston, was founded in 1861 and went into operation in 1864. Its endowment consists of one-third part of the income derived by the state from lands appropriated for such purposes by congress in the act of 1862. It provides a series of scientific and literary studies, so arranged as to offer a liberal and practical education in preparation for active pursuits, as well as a thorough training for most of the scientific professions. The courses of a distinctively professional character are: 1. Civil and topographical engineering; 2. Mechanical engineering; 3. Mining engineering, or geology and mining; 4. Building and architecture; 5. Chemistry. Five other courses have been established, as follows: 6. Metallurgy; 7. Natural history; 8. Physics; 9. Science and literature; 10. An elective course. Each of these courses extends through four years, and for proficiency in any one of them the degree of bachelor of science is conferred. Special laboratories are provided for the instruction of women, the design being to afford them facilities for the study of chemical analysis, industrial chemistry, mineralogy, and biology. Instruction will be given to women on other subjects, also so far as suitable arrangements can be made for them. The particular course of study, which a candidate for the degree of doctor of science wishes to pursue, must be submitted to the faculty in writing, and must meet their approval. A knowledge of the Latin language is not required for admission, but strongly recommended for the better understanding of the terminology of the sciences. The school of mechanic arts affords instruction in carpentry and joinery, wood-turning, pattern-making, foundry work, iron-forging, vise-work, and machine tool work. Candidates for

a degree in physics take practical courses in microscopy, photography, lantern projections, and meteorology. The institute has 16 professors, 8 instructors, 8 assistants, and 243 graduates President, Wm. B. Rogers, LL.D.

MAS'SA DUCA'LÉ, or DI CARRA'RA, so called to distinguish it from the many towns of the same name, is a small city of northern Italy, 58 m. s.w. of Modena, and formerly capital of duchy of Massa-Carrara. Pop. 5,000. It is a bishop's see, has a public library a literary institute, a cathedral, and a ducal palace. Massa stands in a beautiful situation, sheltered by a background of mountains, and surrounded by a district productive in oranges, citrons, and vast olive-groves. In the middle ages the duchy of Massa was held by a succession of feudal lords, and passed to the house of Este, dukes of Modena, toward the close of the 18th century. Bonaparte invested his sister, the princess Eliza, with the principality of Massa and Carrara; but in 1829 it was reunited to Modena, and in 1860 became a province of the kingdom of Italy. Pop. '71, 161,994.

MASSAF'RA, a t. of the Italian province of Otranto, 11 m. n.w. of Taranto, situated in a plain in the midst of hills more productive than salubrious. Pop. 9,100. Its site is partly that of the ancient *Messapia*, from which the whole district takes its name.

MASSA'GETÆ, a nomadic people who inhabited the broad steppes on the n.e. of the Caspian sea, to the northward of the river Araxes or Jaxartes. Herodotus says that they had a community of wives; that they sacrificed and devoured their aged people; that they worshiped the sun, and offered horses to him; that they lived on the milk and flesh of their herds, and on fish; and fought on horseback and on foot with lance, bow, and double-edged axe. Cyrus is said to have lost his life in fighting against them, 530 B.C. Niebuhr and Böckh are of opinion that they belonged to the Mongolian, but Humboldt and others, to the Indo-Germanic or Aryan family.

MAS'SA LUBRE'NSE, a pleasant Italian t., 17 m. s. of Naples by sea. Pop. 3,600. Massa Lubrense stands amidst the loveliest scenery of Italy, and is built on a cliff projecting into the sea, and commanding a fine view of the bay of Naples. It dates from the early Greek period, and contains many remains of Roman antiquities. It is famed for the beauty of its women.

MASSA MARIT'TIMA, a t. in Italy, on the n.w. coast in the province of Grosseto, near the barren and unhealthy district of the Maremma; pop. 13,052. It has been a subject of dispute between the cities of Siena and Pisa, each having claims on the town, which is the seat of a bishopric formerly having its seat at Populonia, and is composed of several contiguous villages. The coast in its vicinity is traversed by a railroad.

MASSARUNI, or MAZARUNI, RIVER, in British Guiana, takes its rise in the mountains of Venezuela, lat. 4° 30′ n., long. 60° w., and flows in an extremely irregular course in a general n.e. direction until it joins the Guyuni (or Cuyuni), through which it empties into the estuary of the Essequibo river. The river has been explored for several hundred m. and is marked by a number of small islands at its mouth, and by wild scenery and bold granite cliffs in its upper course.

MASSASOIT, sachem of the Wampanoag or Pokanoket Indians. His territory at one time extended over nearly all the southern part of Massachusetts from cape Cod to Narragansett bay, and his tribe numbered 30,000, but at the time of the landing of the Pilgrims they had been reduced by disease to about 300. In 1621, Mar. 22, he visited Plymouth three months after it was founded, with 60 armed and painted warriors, for the purpose of making a friendly league with the white men. Governor Carver was so much pleased with the frank and friendly bearing of Massasoit, that on behalf of the colony he concluded a treaty of peace and mutual protection with the Wampanoags. This was sacredly kept for 50 years. Massasoit always remained friendly to the colonists. He resided in Pokanoket, or what is now the town of Bristol, R. I., where commissioners from the adjacent settlements often visited him. When Roger Williams was banished from Massachusetts, he was entertained on his way to Providence by Massasoit for several weeks. Although the English committed repeated usurpations upon his lands and liberties, he was their friend as long as he lived, imbued his people with the love of peace, and gave notice to the Pilgrims when they were in danger from other tribes. He had several sons, grandsons, and brothers. Before his death, which is supposed to have been in 1662, he had been induced to cede away at different times, nearly all his lands to the English. His two eldest sons, Wamsutta and Pometicom, or Metacomet, had English names, of which the following account is given: "After Massasoit was dead his two sons, called Wamsutta and Metacomet came to the court at Plymouth, pretending high respect for the English, and therefore desired that English names might be given them; whereupon the court there named Wamsutta, the elder brother, *Alexander*, and Metacomet, the younger brother, *Philip*." Massasoit was succeeded by his eldest son Alexander, who dying a few months after, Philip became by the order of succession head chief of the Wampanoags. These two sons, after their father's death, were regarded with much jealousy by the English, and were suspected of plotting against them; and Philip afterwards was distinguished by his wars with the English.

MASSÉ, GABRIEL, b. France, 1807; studied law and was called to the bar of Paris in 1833. He met with great success in his practice, but is best known as the author of a number of legal treatises and as editor of the *Recueil des Arrêts*. His best work, *Le*

Droit Commercial dans ses Rapports avec le Droit des Gens et le Droit Civil was printed from 1844 to 1848 and republished in 1863. In 1874 he became a member of the academy of moral and political sciences.

MASSÉNA, a t. of St. Lawrence co., N. Y., pop. '70, 2,709. situated on the Grass and Racket rivers, and bounded on the n.w. by the St. Lawrence. The township comprises Massena Center, Massena Springs and the village of Massena. The three streams furnish abundant water power, and the chief industry is the milling of flour. The portion called Massena Springs is quite popular as a watering place and has four or five hotels.

MASSENA, ANDRÉ, Duke of Rivoli, prince of Essling, and a marshal of France, was born at Nice, May 6, 1758. In his youth, he served as a ship-boy in a small vessel, and afterwards 14 years in the Sardinian army, but left it because his plebeian birth precluded him from promotion. Early in the French revolution, he joined a battalion of volunteers, and soon rose to high military rank. In Dec., 1793, he was made a general of division. He greatly distinguished himself in the campaigns in upper Italy. After Jourdan's defeat at Stockach on Mar. 25, 1799, the chief command of the army in Switzerland devolved on him in circumstances of great difficulty, but he kept his ground against the archduke Charles, and finally, by his victory over the Russians at Zürich, Sept. 25, 1799, freed France from the danger of invasion. After the battle of Marengo, Bonaparte gave him the command of the army of Italy. In 1804 he was made a marshal of the empire. In 1805 he again commanded in Italy; and subsequently he signalized himself in the terrible contest for the village of Aspern (q.v.). In 1810 he was intrusted with the chief command in Spain, and compelled the British and their allies to fall back to Lisbon; but being unable to make any impression on Wellington's strong position at Torres Vedras, he resigned his command. He offered his services, however, again, when Napoleon was preparing for the Russian campaign, but was only intrusted with the command in Provence, and in this position he remained till the restoration, when he gave in his adhesion to the Bourbons, and was made a peer. On Napoleon's return from Elba, he invited Massena to follow him, but received no response. After the second restoration, Massena retired into private life. He died April 4, 1817. Massena was one of the ablest of Napoleon's generals, but he was as extortionate as a Roman pretor. His master called him a robber, and is said to have offered him a present of 1,000,000 francs if he would give up peculation.

MASSEY, GERALD, b. in Herefordshire, 1828, of poor and illiterate parents who could give him no education. He was set to labor in a silk-mill when 8 years old, and afterwards at straw plaiting. At 15 he found employment in London as errand boy, and got hold of a few books, among them *Pilgrim's Progress*, and *Robinson Crusoe*. At 17 he was in love, and began to write verses. But his themes embraced also the sufferings of the poor, and showed deep thoughtfulness and feeling concerning the inequalities of human condition. The French revolution of 1848 awakened in his mind the desire to contribute something to the amelioration of his own class through political efforts, and in company with fellow-workmen he started a weekly reform paper under the title of the *Spirit of Freedom*. The rev. Charles Kingsley and other prominent philanthropic political agitators of that time gave their council and aid, and called public attention to the poetic faculties of Massey. He afterwards became a lecturer on Spiritualism in England, and in 1873 in the United States. The English government granted him a pension, and lord Brownlow presented him with a cottage in his native county, where he resides. His published works embrace *The Ballad of Babe Christabel and other Poems*, 1853; *Craigcrook Castle*, 1856; *Robert Burns and other Lyrics*, 1859; *Voices of Freedom and Lyrics of Love*, 1859; *Havelock's March, and other Poems*, 1861; *Shakespeare's Sonnets, never before Interpreted*, 1866; and *A Tale of Eternity, and other Poems*, 1870.

MAS'SICO, a mountain in the province of Terra di Lavaro, Naples, Italy, famous in ancient and modern times for the wines produced from its vineyards. On its southern slope is a town of the same name. It was here that Appius Claudius gained his victory over the Samnites.

MAS'SICOT, a mineral, occurring in shapeless masses of a yellow color, brittle, with earthy fracture. Chemically, it is protoxide of lead. It is used as a pigment.

MASSIE, NATHANIEL, 1763–1813; b. in Goochland co., Va.; at 17 years of age entered the revolutionary army; became a surveyor, and settled in Kentucky in 1783; removed to Manchester, Ohio, in 1790, and laid out the town of Chillicothe upon lands owned by himself; took part in the Indian wars of the northwest, gaining the rank of general of Ohio militia; was a member of the convention which framed the first constitution of Ohio in 1802; was often a member of the legislature, and served one term as speaker of the senate; was declared to have been elected governor in 1807, but resigned before entering upon office.

MASSILIA. See MARSEILLES, *ante*.

MASSILLON, a city in n.e. Ohio, on the e. bank of the Tuscarawas river, and on the Ohio canal, connecting it with lake Erie; pop. '74, 7,000. It is a junction of the Pittsburg, Fort Wayne and Chicago; the Cleveland, Tuscarawas Valley and Wheeling; and the Massillon and Cleveland division of the Cleveland, Mount Vernon and Delaware rail-

roads. It is the center of the famous coal fields of Tuscarawas valley, and has a prosperous community, engaged in farming and important industries and mining. In the vicinity are 3 quarries of white sandstone, which is largely exported. It is a shipping point for large quantities of grain, wool, butter, and beef. Its industries are represented by blast furnaces for pig-iron, rolling-mills, flour-mills, sash factories, machine shops, iron-bridge factories, paper-mills, the Russell mills for the manufacture of agricultural implements, the Massillon excelsior works, and the Massillon harvester works for the manufacture of machinery, sold extensively at the west. It has 3 newspapers, and a library for the use of members of the young men's Christian association. The first surveys for the township were made in 1826. It presents a fine appearance, being regularly built, and containing many fine residences and substantial public edifices, and is lighted by gas. It has excellent educational advantages, including a school supported by charitable people; 11 churches, 3 banks, 2 of which are national, and an opera house erected at a cost of $100,000.

MASSILLON, JEAN BAPTISTE, one of the most distinguished of modern pulpit orators, was b. at Hières, in France, June 24, 1663. His father, a notary, designed the boy for his own profession; and it was only after repeated and persistent efforts that Massillon obtained his father's permission to enter the congregation of the oratory in 1681. It was while he was engaged in teaching theology in one of the houses of the congregation in the diocese of Meaux that he made his first essay in the pulpit at Vienne. His funeral oration on M. Villars, the archbishop of Vienne, was eminently successful, and led to his being called by the superiors of the oratory to Paris, where he first had the opportunity of hearing Bourdaloue, whose style and manner, without being exactly taken by Massillon as a model, had great influence in forming the taste of the young aspirant. Like Bourdaloue, he avoided the declamatory manner and theatrical action then popular in the French pulpit; but the earnest impressiveness of his look and voice more than supplied the vigor and energy which other speakers sought from these adventitious aids. His course of ecclesiastical conferences, delivered in the seminary of St. Magloire, established his reputation. The criticism of Louis XIV., after his advent course at Versailles, that "when he heard other great preachers he felt satisfied with them, but when he heard Massillon he felt dissatisfied with himself," well expresses the characteristics of the eloquence of this great orator, who, more than any of his contemporaries, was able to lay bare the secret springs of human action, and to use the feelings and the passions of his audience as arms against themselves. He was again appointed to preach the Lent at Versailles in 1704; but although the king was again equally warm in his admiration of the preacher, Massillon was never afterwards invited to preach in the presence of this monarch; yet his funeral oration on the prince de Conti, in 1709, was one of the greatest triumphs of his oratory. Soon after the death of Louis XIV., Massillon, in 1717, was named bishop of Clermont, and in the same year was appointed to preach before the young king Louis XV., for which occasion he composed his celebrated *petit carême*—a series of ten sermons. It was not till 1719 that he was consecrated bishop of Clermont, in which year also he was elected a member of the academy; and in 1723 he preached the funeral oration of the duchess of Orleans, his last public discourse in Paris. From this time he lived almost entirely for his diocese, where his charity, gentleness, and amiable disposition gained him the affections of all. He died of apoplexy in 1742 at the age of 79 years. His works, consisting mainly of sermons and other similar compositions, were collected in 12 vols., by his nephew, and published in 1745–46; later editions are those of Beaucé (4 vols. 1817), Mequignon (15 vols. 1818), and Chalandre (3 vols. 1847).

MASSINGBERD, FRANCIS CHARLES, 1800–72, b. in Lincolnshire, England, and educated at Magdalen college, Oxford. After graduating with high honors he entered the church and became rector of South Ormsby in his native county (1825). In the Lincoln cathedral he was made a prebendary in 1847, and in 1862 chancellor. In addition to many papers and discussions on ecclesiastical subjects he was the author of *Church Reform* (1837), *History of the English Reformation*, *Law of Church and State*, and *Lectures on the Prayer Book* (1864).

MASSINGER, PHILIP, an English dramatist, was b. in 1584 at or near Wilton, it is supposed, the seat of the earls of Pembroke, of which family his father was a retainer. Of his boyish days, and of the place of his education, nothing is known. From his plays we are, however, certified that he was a classical scholar. He entered St. Alban's hall as a commoner in 1602, and quitted the university suddenly, and without obtaining a degree, on the occasion, it is surmised, of his father's death. After leaving Oxford his career cannot be clearly traced. He came to London, and wrote for the stage, sometimes on his own account, frequently—as was the fashion of the time—in conjunction with others. He produced many plays, the dates of which are obscure. He seems to have lived in straitened circumstances, and to have been of a melancholy turn of mind. On the morning of Mar. 16, 1640, he was found dead in his bed. He was buried in the church-yard of St. Saviour's by the hands of the actors. In the parish register stands the pathetic entry: "March 20, 1639–1640, buried Philip Massinger, a stranger."

Taken as wholes, Massinger's plays do not strike one much; their merits consist in detached passages. He was of a grave and serious mood, and his reflective passages rise into a rich elaborate music. His finest writing is contained in *The Virgin Martyr*, but his

best plays are *The City Madam* and the *New Way to Pay Old Debts*—the last of which has even yet some slight hold on the stage. The best edition of his works is that by Gifford (Lond. 1805, reprinted 1815).

MASSINISSA. See MASINISSA.

MASSON, DAVID, b. Aberdeen, Scotland, 1822; educated at Marischal college, Aberdeen, and the university of Edinburgh, became editor of a Scottish provincial paper at the age of nineteen: went to London in 1844, remained a year, contributing to *Fraser's Magazine* and other periodicals. For two or three years he was in Edinburgh, writing for periodicals. In 1847 he returned to London where he remained 18 years, and while there was chosen professor of the English language and literature at the University college, London. He retired from this post in Oct., 1865, having been appointed professor of rhetoric and English literature in the university of Edinburgh. He contributed numerous articles to the *Quarterly*, *British Quarterly*, and the *North British Review*, to the *Encyclopædia Britannica*, and the *English Cyclopædia*, and in 1859–68, was the editor of *Macmillan's Magazine*. To this he contributed numerous articles. His best-known papers are on *Carlyle's Latter-Day Pamphlets; Dickens and Thackeray; Rabelais; Literature and the Labor Question; Pre-Raphaelism in Art and Literature; Theories of Poetry; Shakespeare and Goethe; Hugh Miller; De Quincey and Prose-writing.* He has published *Essays, Biographical and Critical, chiefly on English Poets; Life of John Milton; British Novelists and their Styles; Recent British Philosophy, a Review with Criticism, including some Remarks on Mr. Mill's Answer to Sir W. Hamilton; Chatterton: a Story of the year* 1770; *Essays on Wordsworth, Shelley, Keats.* In 1873 he published a biography of the poet Drummond, entitled, *Drummond of Hawthornden: the Story of his Life and Writings; The Three Devils—Luther's, Milton's, and Goethe's.* His life of Milton is of high authority.

MASSO'RAH, variously derived from *massar* (to hand down to posterity—tradition), and *assar* (to bind, to fix within strict limits), denotes chiefly a certain collection of critical notes on the text of the Old Testament, its divisions, accents, vowels, grammatical forms, letters, etc.; all the more necessary for the more accurate preservation of the sacred documents, as, according to the early mode of Shemitic writing, only the consonants, and these without any stop or break, were put down; a proceeding which, in the course of time, must naturally have produced a vast number of variants, or rather different ways of reading and interpreting the same letters, by dividing them into different words with different vowels and accents. The origin of the Massorah, which, by fixing an immutable reading upon each verse, word, and letter, put an end to the exercise of unbounded individual fancy—which, for homiletical purposes alone, was henceforth free to take its own views—is shrouded in deep mystery. The first traces of it are found in certain Halachistic works treating of the synagogue rolls of the Pentateuch, and the mode of writing them. Some of the earliest works on the subject have survived in their titles only, such as *The Book of the Crowns, The Book of the Sounds*, etc., attributed to the Soferim, or masters of the Mishna (q.v.). There can hardly be a doubt that the Massorah, like the Halacha and Haggada, was the work, not of one age or century, but of many ages and centuries, as, indeed, we find in ancient authorities mention made of different systems of accentuation used in Tiberias, Babylon (Assyria), and Palestine. It was in Tiberias also that the Massorah was first committed to writing, between the 6th and 9th centuries A.D. Monographs, memorial verses, finally glosses on the margins of the text, seem to have been the earliest forms of the written Massorah, which gradually expanded into one of the most elaborate and minute systems, laid down in the "Great Massorah" (about the 11th c.), whence an extract was made known under the name of the "Small Massorah." A further distinction is made between Massorah *textualis* and *finalis*, the former containing all the marginal notes; the latter, larger annotations, which, for want of space, had to be placed at the end of the paragraph. The final arrangement of the Massorah, which was first printed in Bomberg's Rabbinical Bible (Ven. 1525), is due to Jacob ben Chajim of Tunis, and to Felix Pratensis. The language of the Massorah is Chaldee, and besides the difficulty of this idiom, the obscure abbreviations, contractions, symbolical signs, etc., with which the work abounds render its study exceedingly hard. Nor are all its dicta of the same sterling value; they are not only sometimes utterly superfluous but downright erroneous. Of its "countings," we may adduce that it enumerates in the Pentateuch 18 greater and 43 smaller portions, 1534 verses, 63,467 words, 70,100 letters, etc.—a calculation which is, however, to a certain degree at variance with the Talmud. An explanation of the Massorah is found in Elijah Levita's (q.v.) *Masoreth Hammesoreth* (transl. into German by Semler, Halle, 1772), and Buxtorf's *Tiberias* (1620), a work abounding with exceedingly curious information on the text of the Old Testament.

MAS'SOWAH, or MASOUA, an islet and t. on the w. coast of the Red Sea, in lat. 15° 36′ n., and long. 39° 21′ e., close to the boundary between Nubia and Abyssinia. At present it is politically connected with Nubia rather than with Abyssinia, being in the possession of the viceroy of Egypt, and ruled by a governor appointed by him. The island is of coral, the soil partly formed from the rock, partly from sand and broken shells. It is only about a mile and a quarter in circumference, and is distant from the main-land only about 200 yards. It is almost wholly occupied by the town, and contains

a pop. of about 8,000, mostly Arabs. The Abyssinian coast is very destitute of harbors, and Massowah is of great importance as a seat of commerce. It carries on a large trade by sea with Bombay and with the Arabian coast, particularly with Jiddah and Yembo; and a large trade also by caravans with Cairo on the one hand, and with Gondar and the whole interior of Abyssinia on the other. Caravans start at all seasons for Cairo and for Gondar; but most numerously in January, at the end of the rains, and in June, before the swelling of the waters. Wheat, rice, maize, durra, salt, tobacco, gunpowder, sugar, cotton and silk goods, scarlet cloth, glass-wares, arms, and hardwares are among the principal imports from the more distant parts of the world. From Abyssinia and the coasts of the Red Sea, Massowah receives and exports ivory, rhinoceros horns, wax, ostrich-feathers, tortoise-shell, myrrh, senna, pearls, etc. Massowah has all the worst characteristics of an oriental town. Its streets are mere lanes, and excessively dirty. Massowah was originally chosen as the place of debarkation of the British expedition to Abyssinia (1867), and the starting-point of its operations; but it was soon found unsuitable, and Annesley bay, about 15 m. further to the south—the deepest inlet on the Abyssinian coast—was chosen for that purpose instead.

MAST, an upright or nearly upright spar, resting on the keelson (q.v.) of a ship, and rising through the decks to a considerable height, for the purpose of sustaining the yards on which the sails are spread to the wind. It is usually in joints or lengths, one above the other, the lowest and strongest being the *mast* proper, distinguished by its position as the fore, main, or mizzen mast. Above this come successively the *top-mast*, the *top-gallant-mast*, the *royal-mast*, and—though very rarely used—the *sky-scraper*. The full height of all the masts together, in a first-rate ship of war, was about 250 feet. As when a strong wind is blowing, the pressure upon the canvas carried by a mast amounts to many tons, the mast itself must be of great strength. In some modern vessels hollow iron masts are used, with great success, as being much lighter than those of wood; but the majority are of Norway fir of the best quality. In small vessels the mast is made of one tree; but it is considered stronger when "a made mast," that is, when constructed of several pieces riveted together, and strengthened by iron hoops. The mast is sustained, when fixed, by the shrouds, as supports on each side, by the stay (q.v.) in front, and the back-stays behind. See MASTS.

MASTER, in the royal navy, was an officer ranking with, but junior to, lieuts., and charged with the details of sailing the vessel, under the general orders of the capt. In recent years the title has been changed to "navigating lieut.:" the change of name carrying, in several particulars, an improved status. It is his duty to take charge of such of the ship's stores as are not under the pay-master; in short, he is the navigator and storekeeper for the vessel; as such, holding a most responsible and onerous position. For his assistants, he has the junior officers in his own department—the navigating sub-lieuts., navigating midshipmen, and navigating cadets—and the ship's quartermasters. The full pay of a navigating lieut., exclusive of store and other allowances, ranges from 12s. to 22s. a day; of a navigating sub-lieut., from 5s. to 7s. 6d.; and of a navigating midshipman, from 3s. to 4s. a day: while as alpha and omega, the staff-captain has 22s. a day; and the navigating cadet, 1s. a day (which is, of course, meant merely for pocket-money).

In the merchant navy, the master of a vessel, usually by courtesy denominated the captain, is the officer commanding her. His duties comprise the maintenance of discipline, the sailing of the ship, the charge of her cargo, and many other mercantile functions. His responsibilities to the ship's owners are of course settled by distinct agreement, applicable to the special case. Towards the public, however, many acts of parliament determine his responsibility. The master is bound to come to a written agreement with each of his men, before sailing, as to the wages to be paid. He is bound to bring home and subsist (to the number of 4 for every 10 tons), seafaring persons—British subjects—who may have been cast away, captured by the enemy, or by other unavoidable accident left upon a foreign shore; for these he is granted head-money by the admiralty. The master is compelled to keep a proper log-book, and must produce it, with his ship's papers, on the requisition of the commander of a ship-of-war of his own nation. Masters of vessels of a certain size are required to obtain certificates of qualification from the board of trade. Certificated masters are eligible for the ROYAL NAVAL RESERVE (q.v.), with the rank of lieutenant.

MASTER (Ger. *meister*, Lat. *magister*, from *magis*), one who rules, governs, has servants under him. As a complimentary appellation of respect, it is prefixed to the Christian name and surname, or surname simply, contracted into Mr. in writing, and pronounced "Mister." The eldest son of a baron in the peerage of Scotland is generally known by the title of the "master of——," prefixed to his father's title of peerage.

MASTER-AT-ARMS is a petty officer on board a ship-of-war, charged with the care and instruction in the use of small arms, except as regards the marines. He is also employed in maintaining discipline, order, and cleanliness among the crew. His assistants in his duties are the "ship's corporals."

MASTER OF ARTS (abbreviated M.A., and sometimes, particularly in Scotland, A.M.,) is a degree conferred by universities or colleges. In the universities of England,

this title follows that of bachelor (q.v.). It is the highest in the faculty of arts, but subordinate to that of bachelor of divinity. A master becomes a regent shortly after obtaining his degree, and thereby obtains the privilege of voting in congregation or convocation at Oxford, and in the senate at Cambridge; and in the Scotch universities, of becoming a member of the general council. See DEGREE.

MASTER OF THE BUCKHOUNDS, an officer in the master of the horse's department of the royal household, who has the control of all matters relating to the royal hunts. A salary of £1500 is attached to the office, which is regarded as one of considerable political importance. The master of the buckhounds goes out of office on a change of ministry.

MASTER OF THE CEREMONIES, an office instituted at the court of England in 1603, for the more honorable reception of ambassadors and persons of distinction. The same term was afterwards extended beyond the court, by being applied first to Beau Nash, the famous "master of the ceremonies," or president of the amusements at Bath, and then to other persons exercising the same function in ordinary assemblies.

MASTER OF COURT is the title given in England to the chief officers under the judges, their duty being to attend the sittings of the courts during term, and make minutes of their proceedings. They also tax all the bills of costs of the parties arising out of the suits and matters before the courts. They are appointed by the chief judge of the court, and hold their offices for life during good-behavior. Masters in chancery were similar officers in the court of chancery, but were abolished, and the duties are now performed partly by the judge, and partly by the registrars.

MASTER OF THE GREAT WARDROBE, an officer at the court of England, who had, in former times, the superintendence of the royal wardrobe. The office existed from a very early period down to 1782, and was considered a position of great honor. Its duties are now transferred to the lord chamberlain.

MASTER OF THE HORSE, the third great officer of the court, who has the superintendence of the royal stables, and of all horses and breeds of horses belonging to the queen. He exercises authority over all the equerries and pages, grooms, coachmen, saddlers, and farriers, and has the appointment and control of all artificers working for the queen's stables. He is answerable for the disbursement of all revenues appropriated to defray the expenses of his department; but his accounts are audited and examined by the board of green cloth. He has the privilege of making use of the royal horses, pages, and servants, and rides next to her majesty on all state occasions. The office is one of great antiquity, and is considered to be a position of great honor. The master of the horse is appointed during pleasure, by letters-patent; but his tenure of office depends on the existence of the political party in power. The salary is £2,500 a year.

MASTER OF THE HOUSEHOLD, an officer in the lord steward's department of the royal household, whose specific duties consist in superintending the selection, qualification, and conduct of the household servants. He is under the treasurer, and examines a portion of the accounts. The appointment is during pleasure, and is not dependent on political party. The salary is above £1100 per annum.

MASTER IN CHANCERY, an officer of a chancery court, appointed to assist the chancellor. His duties, in general, are prescribed by statute. It is a common practice to refer causes to a master for hearing, particularly causes involving intricate accounts, and requiring computations. A master is often appointed to examine witnesses, to take depositions, to inquire into and report the facts of a case, to make settlements under deeds, to discharge special acts under the direction and in behalf of the court, etc. Masters in chancery were formerly clerks in chancery, 12 in number, with the master of the rolls at their head. They were at first called *preceptores*, and were not called masters, till the time of Edward III. The office has been abolished in England, where the duties formerly belonging to masters are discharged by judges or registrars. In most of the United States the office still exists, with the duties already described annexed to it, subject to statutory modification in the various states. In some states, officers with the same functions as masters in chancery, are called commissioners.

MASTER OF THE ROLLS, the president of the chancery division of the high court of justice in England, and in rank next to the lord chief-justice of England, and the lord chancellor. He was an ancient officer of the court, and was formerly the chief of the masters in chancery. He is the only superior judge in England who can now be elected to represent a constituency in the house of commons. The master of the rolls had originally the custody of the rolls or records; in the course of time this charge became merely nominal, the custody having vested in officers not in his appointment or control; an anomaly which was remedied by 1 and 2 Vict. c. 94, which restored the custody to him with extensive powers. The salary is £6,000 a year.

MASTER AND SERVANT. The relation of master and servant is constituted in Great Britain entirely by contract; for there being no status of slavery recognized in law, one person can only serve another with his or her own free consent. Being a mere contract, it may, like other contracts, be broken at will, subject only to the usual consequence that the party in the wrong is liable to pay damages for the breach. In England and Ireland the engagement or hiring of a servant may be either verbal or in writing; but if

the engagement is for more than one year, it must be in writing. If for an indefinite time, no writing is necessary. When a servant continues in the service after the first year, a renewal of the contract is presumed on the same terms. Sometimes it is difficult to say whether an engagement of an indefinite kind is by the year, or by the month or week; in such cases a material fact is how the wages were to be paid, for if they are paid weekly, the presumption will be that the hiring was by the week, unless there are other circumstances to show that a yearly hiring was meant. The difference between a yearly contract and a weekly one is that if the servant is discharged without cause during the year, he is entitled to wages up to the end of the year; and on the other hand, if he leave without cause during the service, he is entitled to no wages at all.

A servant undertakes to have competent skill for the duties of the service, and is bound to use due diligence, and to conduct himself respectfully. He is bound to obey all lawful orders of his master during the engagement, if they are within the scope of the particular service for which he was engaged. Thus, a coachman is not bound to do the duties of a cook, and *vice versa*. Every servant is bound to take due care of his master's property, and he is liable to an action at the suit of his master for gross negligence, and also for fraud and misfeasance. A master is not entitled to chastise a servant, whatever the age of the servant may be, though, in the case of an apprentice under age, a moderate chastisement is justifiable. The grounds on which a servant may be lawfully discharged are willful disobedience, gross immorality, habitual negligence, and incompetence. If any person entice away a servant, and thereby cause loss to the master, the latter may sue such person for the injury. If the servant is a female, and is seduced, and thereby is unable to continue her service, the master may also bring an action against the seducer for any loss of service caused thereby; and on the same principle a master may bring an action against a third party who causes personal injury to the servant. In the case of the bankruptcy of the master, a preference is given to the servant's wages if due and unpaid, but this extends only to two months' wages, and the servant is an ordinary creditor for the balance beyond that sum. The death of the master is a discharge of the contract; and in many cases the servant is not entitled to recover wages for the time actually served, though there is an exception as to domestic servants. If a servant is rightfully discharged he is not entitled to wages for the broken time since the previous periodical payment of wages; and so in the case of the servant's death during the currency of the term, the servant's executors cannot recover payment for the broken time; but it is otherwise in the case of domestic servants. When a servant falls sick the master is not bound to provide medical attendance whether the servant lives under his roof or not; but as in such cases a doctor is often sent for by the master without any express understanding between the parties, the master is frequently made liable on the ground that the doctor was sent for by and gave credit to the master. As a general rule, the servant takes the risk of all the ordinary accidents attending the particular service; and if he suffer from an accident met with in the course of the service, the master is not liable for the consequences, unless there was some personal negligence on his part. Thus, it often happens that servants are engaged in a manufactory or building where machinery is used and accidents frequently occur. Another case often occurs where two or three servants of the same master are engaged together, and one servant is injured by the negligence of another. In such a case the rule is that the injured servant can sue the master, except where the servants at the time were engaged in a common operation, for in the latter case the servants are or ought to be a check on each other. In cases where a servant injures a third party, the rule is that the master is liable, provided the servant at the time was acting in the ordinary course of his duty, and within the scope of the master's orders, expressed or implied. Hence, if a coachman carelessly run down a person on the highway, or do injury to another, the master is liable; but if the coachman was driving the master's carriage without or contrary to the orders of the master, the servant alone is liable. So the master is not in any way responsible for the crimes or criminal offenses committed by his servant; yet sometimes he is involved in fines. The above are the general rules as regards servants generally; but in England there is a distinction in many instances observed between domestic servants and other servants. The leading distinction is that if nothing is said as to the length of service, it is presumed that the service can be terminated at any time, on giving a month's notice on either side, or in case of the discharge of a domestic servant without notice, then on payment of a month's wages. It is often popularly thought that a domestic servant cannot be turned out of the master's house at a moment's notice, even on paying a month's wages, but this can always be done with or without cause. In case of discharge without cause, the servant is entitled to a month's wages, but not board wages; she also gets wages only up to the master's death. He is not compelled to give a character to the servant; it is entirely optional; but if he does so, then it must be a true one, otherwise an action will lie for defamation. But if a master without malice, and acting *bona fide*, gives an untrue character, he is not liable, for the communication is held to be privileged. If a master knowingly give a false character to a servant who is engaged by a third party on the faith of it, and robs such third party, the latter can sue the former master for the damages. Persons personating masters, and giving false characters, and servants using such false characters, are liable to be summarily convicted, and fined £20.

In general, a servant, if he refuse to enter the service, or leave it without cause, is

merely liable to an action of damages for breach of contract, which is no remedy at all, as few servants are worth the expense of a suit. As this conduct, however, might often cause great hardship to masters, especially where they are employed in trade or manufactures, statutes have been passed which give a power to justices of the peace to compel the servant to remain in the service until he give the legal notice to leave. This was formerly done by punishing the servant who left the service without just cause by imprisonment. This law, complained of by workmen as one-sided, was modified by the employers and workmen act (1875), which gives county courts enlarged powers in regard to payment of money, rescission of contract, and taking of security as between employers and workmen; and by the conspiracy act (1875), which, while deciding that in trade disputes no combination shall be indictable if the act contemplated done by one person would not be so, makes special criminal provision in case of persons employed by gas and water companies.

In *Scotland* the law as to master and servant differs from the above in several particulars, of which the following are the most important. With regard to domestic servants, in towns, if nothing is said, then the hiring is for half a year, and cannot be put an end to without 40 days' warning before the end of the half year; and if the servant is dismissed without just cause, he or she can claim not only wages but board-wages till the end of the term. In case of the master's death the servant can claim wages for the whole of the current term, but is bound in that case to serve the executors, or look out for another situation. In case of the master's bankruptcy the servant is a privileged debtor for the wages of the current term. In most other respects the law as to servants is the same as in England. The statutes enabling justices of the peace to imprison defaulting workmen and artificers have been modified.

MASTER AND SERVANT. [*From Supplement.*] The act 30 and 31 Vict. c. 141, called the master and servant act, 1867, having caused profound dissatisfaction among workmen, a royal commission was appointed to investigate and report. The first two sections were found to be objectionable because they conferred a power to inflict simple imprisonment as the penalty for breaking a purely civil contract. The 14th section was found to be equally open to objection, as it authorized imprisonment for three months, with hard labor, in cases of an exaggerated character. Upon the above report are based the existing acts—the employers and workmen's act (38 and 39 Vict. c. 90) and the conspiracy and protection of property act (id. c. 86)—which repeal that of 1867, and came into force on Sept. 1, 1875. The first act, which is divided into five parts, empowers county courts, in respect of disputes between employers and workmen, to make orders of payment of money; to set off one claim against another, whether liquidated or unliquidated; to rescind any contract, and to accept in room of damages security for so much of the contract as remains unperformed. A court of summary jurisdiction may exercise all the powers as above when the sum in dispute is under £10. Disputes between master and apprentice may also here be tried as to indentures or contracts. The term "workman" in this act does not include a domestic or menial servant, but any person engaged in manual labor, under or above 21 years of age, who has entered into or works under a contract for his employer. It does not apply to seamen or apprentices to the sea service. The second or conspiracy act, in relation to trade disputes, declares that in an agreement or combination of two or more persons they cannot be indicted for conspiracy to do that which if done by any one singly would not be punishable as a crime. This does not exempt from punishment any conspiracy punishable by act of parliament, nor alter the law as to riot or unlawful assembly. But crime under this section is defined as an offense punishable either on indictment or summarily, by imprisonment, either absolutely, or as an alternative for some other punishment. The imprisonment is limited to three months. Workmen breaking a contract in connection with the supply of gas or water are liable to conviction either summarily or on indictment, and the offense is punishable by a fine of £20, or imprisonment for three months, with or without hard labor. Willful breach of contract or of hiring, with the probable consequences of danger to human life, incurs a penalty of £20, or imprisonment for three months with or without hard labor. Should a master who is legally liable to provide food, clothing, etc., for a servant or apprentice neglect to do so, he incurs a penalty not exceeding £20. The offender may object to be tried and may be indicted. The parties, and their husbands and wives, are competent witnesses. In Scotland proceedings may be on indictment either in justiciary or sheriff court.

MASTER AND SERVANT (*ante*). In the United States the common-law rules governing this relation have been modified by statutory enactment in a very slight degree only. The law of contracts almost always governs without being restrained by legislation arising from class distinctions or rank. The principles of common law apply in this country more completely than in England, where there are many special statutes on the subject. The terms master and servant are used in more than one sense, and may indicate a relation of service in fact, or such a relation existing only by construction of the law. As applied to domestic service and apprenticeship there is little of importance to be said. The latter relation is now not very common in this country, and the legal principles applicable have long since been well settled. When the words are used in a broader sense the relation indicated is often very like that of principal and agent, and

the general laws of agency apply. The law of this country recognizes no distinction between the hiring or liability of domestic or agricultural servants and others. In the contract there must be mutual engagements, but they need not necessarily be co-extensive. Thus the servant may agree to serve for a year without binding the hirer to retain him for the whole of that period. The contract of service comes under the statute of frauds, and should, therefore, be in writing if for more than one year. If the contract be "entire," that is, for the whole of a definite period, the servant cannot recover unless he serves for the whole time. The master may dismiss for refractory or immoral conduct, and can sue his servant for damages incurred by refusal to perform his duties. On the other hand, if after contract made the master refuse to furnish work, the servant may sue for the whole amount of his wages if he present himself at the proper time in readiness to perform. Thus an opera singer may sue a manager for full contract salary, though the singer may never have been allowed to sing a note. The liability of the master to his servants for damages incurred from one another while in his employment can be based only on neglect by him to furnish proper tools or the willful hiring of incompetent persons. But it has been held, in *Davis* vs. *Detroit R.R. Co.*, 20 Mich., 105, that though a servant was injured by the negligence of a very incompetent fellow-servant, yet he could not recover because, being aware of the incompetence, he voluntarily took the risk. See also 3 Cushing, 270, and 20 Barber (N.Y.), 449. But if the service is of its very nature dangerous, and the servant undertakes it knowingly, he can have no remedy for injuries. More important are the distinctions as regards the liability of the master to third persons for the acts of his servant. The principle which governs is based upon the control or non-control of the latter by the former. The general rule is that the master is liable for all tortuous acts done by a servant when in his service and acting within the scope of his proper employment. A general contractor, however, is not under the control of his employer; and, therefore, the latter is not liable for his acts. But in the case of corporations and particularly in railroad cases the courts of the several states have, from motives of public policy, seen fit to consider the corporation as in fact itself present in the persons of its servants. Again, it was formerly held that a master could not be liable for the willfully wrongful act of his employee, when not acting under direct authority; but in 38 Miss., 242, a railroad was held responsible for the willful and wanton act of an engineer; and the tendency of modern cases is strongly towards enlarging the limits of the doctrine of *respondeat superior* as applied to great corporations which assume extraordinary powers and hold human life and immense property interests in their hands. But notice of want of authority in servants by the superior officers of a railroad will relieve them of liability for the acts of such servants. In 14 Howard, 468, it was held that it made no difference that an inferior disobeyed orders of a superior, provided that he was acting strictly within the scope of his own employment, and the company was held liable. The relations of employer and employed in the railway system have been productive of the most important discussions and decisions as regards the law of master and servant which have arisen in this country. See *Redfield on Railways.*

MASTER SINGERS. See MINNESINGERS, *ante.*

MASTERWORT, *Peucedanum ostruthium.*, a perennial plant of the natural order *umbelliferæ*, having a stem from 1 ft. to 2 ft. high, broad bi-ternate leaves, large flat umbels of whitish flowers, and flat, orbicular, broadly margined fruit. It is a native of the n. of Europe and the n. of America, and is found in moist pastures in some parts of Britain, but apparently naturalized rather than indigenous, its root having formerly been much cultivated as a pot-herb, and held in great repute as a stomachic, sudorific, diuretic, etc.; its virtues being reckoned so many and great that it was called *divinum remedium.* It still retains a place in the medical practice of some countries of Europe, although, probably, it is nothing more than an aromatic stimulant. The root has a pungent taste, causes a flow of saliva, and a sensation of warmth in the mouth, and often affords relief in toothache.

MASTIC, a species of gum-resin yielded by the mastic or lentisk tree (*pistacia lentiscus*, natural order *terebinthaceæ*). It oozes from cuts made in the bark, and hardens on the stem in small round tear-like lumps of a straw-color, or if not collected in time, it falls on the ground; in the latter state it acquires some impurities, and is consequently less valuable. The chief use of this gum-resin is in making the almost colorless varnish for varnishing prints, maps, drawings, etc. It is also used by dentists for stopping hollow teeth, and was formerly used in medicine. It is imported in small quantities, chiefly from the Morocco coast, but some is occasionally brought from the s. of Europe. The name of mastic is also given to oleaginous cements, composed of about 7 parts of litharge and 93 of burned clay, reduced to fine powder, made into a paste with linseed oil.

MASTIFF, a kind of dog, of which one variety has been known from ancient times as peculiarly English, and another is found in Thibet. No kind of domestic dog has more appearance of being a distinct species than this, and it shows little inclination to mix with other races, although the English mastiff has been in part crossed with the staghound and blood-hound. The ENGLISH MASTIFF is large and powerful, with a large head, broad muzzle, large, thick, pendulous lips, hanging ears of moderate size, smooth hair, and a full but not bushy tail. It is generally from 25 to 28 in. high at the shoulder,

but a still greater size is sometimes attained. The mastiff is very courageous, and does not flee even from the lion, for which three or four of these dogs are said to be a match. The Gauls trained British mastiffs and employed them in their wars. The mastiff is now chiefly valued as a watch-dog, for which no dog excels it; and whilst it faithfully protects the property intrusted to it, it has the additional merit of refraining from the infliction of personal injury on the invader. It becomes much attached to its master, although not very demonstratively affectionate; it is excelled by many kinds of dog in sagacity. The English mastiff is usually of some shade of buff color, with dark muzzle and ears. The ancient English breed was brindled yellow and black. The MASTIFF OF THIBET is still larger than the English; the head is more elevated at the back; the skin from the eyebrow, forms a fold which descends on the hanging lip; the hair is very rough, and the tail bushy; the color mostly a deep black.

MASTODON, a genus of fossil proboscidian pachyderms, nearly allied to the elephant, but with simpler grinding teeth, adapted for bruising coarser vegetable substances, or perhaps fitted for an animal of more omnivorous character than its modern representative. The teeth were roughly mammillated, hence the name, meaning teat-tooth. Eleven or twelve species have been described from the miocene, pleiocene, and pleistocene strata in Europe, Asia, and America.

MASTODON (*ante*). The mastodons are distinguished from the elephants principally by their dentition. As in the elephants, the upper incisors grew from permanent pulps and constituted the tusks. In most cases, moreover, the mastodons have lower incisors, and these often formed short tusks, which, however, usually disappeared in the adult. But the more important distinction is found in the molar teeth, which are more numerous in the mastodon, and have nipple-shaped tubercles. These tubercles are in rows, the number of which varies in different species. For this reason Dr. Falconer divided the mastodons into two principal sections, *trilophodon* and *tetralophodon*. In trilophodon are *mastodon giganteus*, of the post-pliocene of North America; *M. tapiroides* and *M. angustidens* of the miocene, in which there are three rows of tubercles. In tetralophodon are *M. latidens* and *M. longirostris* of the miocene, and *M. arvernensis* of the pliocene, in which the molars have four rows of tubercles. In *M. sivalensis* from the upper miocene of India the molar teeth have five rows, and the last six rows of tubercles. For this Dr. Falconer proposed the name of *pentalophodon*. The distribution in time of the mastodon differs in the two hemispheres. In Asia and Europe the genus commenced in the miocene and became extinct in the pliocene. In America no fossils of them have been found previous to the pliocene, but they continued to the end of the post-pliocene period. The *mastodon giganteus* of North America ranged from Canada to Texas. The most complete skeleton perhaps which has been found was discovered in 1845 at Newburg, Orange co., N. Y., in a swamp usually covered with water, and described by Dr. J. C. Warren, of Boston, in which city the skeleton now stands. In this specimen the cranium is flatter than in the elephant, narrow between the temporal fossæ, the face becoming much wider below the nasal opening. The temporal fossæ are very large, indicating great power in the muscles of the jaws. The cervical vertebræ have short spinous processes, except the last, which is 6½ inches. The spinous process of the third dorsal vertebra is 23½ in. long, the others gradually becoming less, the last being 4 inches. The first lumbar vertebra measures, across the transverse processes, 17 in., the body measuring 5 inches. The sacrum consists of five bones and is 20 in. in length on the lower surface. The caudal bones probably numbered about 22, and were very strong at the commencement of the tail. There are 20 ribs, 13 true, and 7 false or floating. The first one is 28 in., and the ninth, the longest, 54½ in. long; the last is 21 inches. The shoulder-blade is more nearly equilateral than in the elephant, and the glenoid cavity, for the reception of the head of the humerus, is 11 by 5 inches. The humerus is 39 in. in length and the same in its largest circumference. The circumference of the elbow joint is 44 inches. The radius is 29 in. long and 6½ in. wide at the lower end; the ulna larger and 34 in. long. The fore foot is nearly 2 ft. broad. The thigh-bone, about the length of the humerus, is 17 in. in circumference at the middle and 30 in. at the lower end; the knee-pan is nearly globular; tibia 28 in. long, 30 in. in circumference at the upper end where it articulates with the thigh-bone, and 13¼ in. at the middle. The skeleton is 11 ft. in height and 17 ft. long from end of face to commencement of tail, which is 6 ft. 8 in. long. The circumference of the skeleton around the ribs is 16 ft. 5 in., and the tusks are 11 ft. long, 8 ft. 8 in. projecting beyond the sockets. About 30 species of mastodon are described by Dr. Warren in his work *The Mastodon Giganteus of North America*, 2d ed. 4to, Boston, 1855. A species similar to the *giganteus* existed during the same time in South America, also species belonging to the European type.

MASTODONSAU'RUS. See LABYRINTHODON, *ante*.

MASTS, IRON AND STEEL. As far back as 1838, the city of Dublin steam-packet company had a steamer with hollow iron masts, the masts acting also as ventilating funnels for the cabins. From that time, iron has been frequently employed for lower masts, in sailing-ships as well as in steamers. The plan has usually been to make them of plates bent to the proper curvature, jointed by internal strips, and strengthened by an internal cross flange of plates secured by angle-irons; but sometimes the plates are lapped. The plates vary from ⅜ to ⅝ in. in thickness. Mr. Grantham (*Iron-shipbuilding*) states that

iron masts are 'lighter and stronger than timber masts; and when compared with the built-up masts of large vessels, are rather less expensive. For vessels of the same tonnage, the difference of weight is nearly two to three in favor of iron.

Iron is used for yards as well as masts. An iron yard was made in 1847 for the Australian clipper-ship *Schomberg*, 112 feet long, and varying in diameter from 14 to 28 in.; it weighed 7½ tons. It was calculated that a timber yard of the same size would weigh 12½ tons. Iron masts have since that time been employed in many ships in the royal navy, made of three vertical ranges of plates bent to the required curvature, with butt joints, and riveted to three T-irons which cover the joints on the inside.

Capt. Cowper Coles (drowned in the *Captain*, a martyr to his own inventiveness, 1870), the inventor of the turret system for ships of war, introduced tripod iron masts. The real mast is strengthened and upheld by two others, the three forming a tripod. The central tube, or real mast, is carried up to form the topmast; while the side tubes are carried up only to the height of the lower yard. The main tube rests upon the keelson; while the side tubes, which are on either side of it and behind it, rest upon parts of the bottom-framing; but all three are fastened to the deck as they pass through. The lower mast only forms the tripod, and is self-supporting, without shrouds, etc.; the topmast is secured with stays, backstays, and out-riggers. Capt. Coles enumerated many advantages which he believed this construction to possess.

Since the use of steel in shipbuilding has become recognized, the employment of the same metal for masts has engaged attention: steel plates, we know, can now be made almost as easily as plates of iron; and it becomes a question of increased efficiency against increased cost as to which metal shall be adopted. Steel being a stronger metal than iron, masts of equal strength would weigh less if constructed of the former than of the latter metal. The hitherto not altogether unfounded distrust felt towards steel in the present state of its manufacture, has prevented its adoption from making such rapid progress as it was once thought it would. Actual use in war and in stormy weather will be necessary, however to determine all the relative advantages of iron and steel for masts.

The subject of the stability of iron masts is treated with much fullness by Mr. Lamport, in a paper read before the Institute of Naval Architects in 1863.

MASUDI, or AL MASUDI (ABUL HASAN ALI BEN HUSEIN BEN ALI), b. Baghdad, 9th c. descended from the great family of the Abdallah-ben-Masud, one of whose members had attended Mohammed, on his flight to Medina. Masudi early devoted himself to profound studies, to which he added by prolonged travels in Spain, Russia, and throughout the east. In the year 303, of the hegira, he was in China, where Arabic colonies already existed: thence he passed through Arabia and Persia to the Caspian sea. Thirty years later, we find him in Syria, and the second edition of his *Golden Meadows*, his last work, was written in Egypt. He is supposed to have died at Cairo, in the 345th year of the hegira, A.D., 956. He was a most voluminous writer upon a great variety of subjects, and no Arabian author enjoys a higher reputation with his countrymen. He was a geographer, a philosopher, a student of religions, to whom Confucianism and Christianity were as familiar as Mohammedanism, and a historian acquainted with the ancient and modern history of the east and west. His *History of the Times*, a history of all nations, has never been printed. A manuscript of it in twenty quarto volumes is in the library of the mosque of St. Sophia. His *Book of the Middle*, devoted largely to geographical inquiry, is known in Europe, only by quotations from it in Arabic writers. As his other works were too voluminous to become popular, he compiled a series of extracts from the *History* and *Book of the Middle*, and published them, with some additions, under the title of *Meadows of Gold* and *Mines of Gems*. This work contains a general view of the political, religious, and social history of the most important Asiatic and European countries; and it includes a treatise on their geography. A partial translation of the *Meadows*, appeared at London, in 1841, from the pen of Dr. Aloysius Sprenger, and as *El Masudi's Historical Encyclopædia;* and there is a French translation called *Les Prairies d'Or*, by Derenburg. Among Masudi's often quoted works, but existing in manuscript only, are *The Book of Consideration*, which treats of the order of succession to the Khalifati; the treatise *On Sincerity*, which gives an account of the various Mohammedan sects, and a treatise on *The Principles of Religion*. Dr. John Nicholson published in 1840 *An Account of the Establishment of the Fatemite Dynasty in Africa*, from a manuscript ascribed to Masudi.

MASULIPATAM', also called KISTNA or KRISHNA, a maritime district of British India, in the government of Madras. Area, 8,036 sq. m.; pop. '71, 1,452,374. Along the shore to a distance of 40 or 50 m. inland, the surface is exceedingly low, lower in some places than the shore itself, and the beds of the Kistnah and the Godavery, the chief rivers. The commercial crops are chay-root, indigo, tobacco, and cotton. Chief town, MASULIPATAM, on a wide bay, in lat. 16° 12' n. Pop. '72, 36,188, who carry on cotton manufactures to some extent.

MAT—MATTING, a product of the manufacture of diverse materials, multiform in shape and varied in design, for purposes differing with the climate and habits of the people where they are made. Flags, rushes, straw, cocoa-nut, and other palm-fiber, grass, rattan, the strands of rope, and the inner bark of trees are used. Some are of primitive pattern and rough workmanship, for the promotion of neatness in the home as a door-mat, to recline on for lack of a bed, for sails instead of canvas, and for doors

and windows. In recent, more refined development of the art, such rude fabrics have served only for protection in moving household and other goods, or preserving trees and plants from the severity of the weather. The manual process of plaiting fibrous material into mats is understood to be the rudimentary intertexture which has resulted—after passing through many gradations growing out of the luxurious habits of the Turks and Persians, and the need of the Mussulman for a portable mat to kneel upon—in the formation of textile fabrics out of threads and yarn, the almost fabulous product of the looms of Persia and India. Rush mats were used in palaces during the reigns of queen Mary and queen Elizabeth, even after the importation of carpets from the east, and lord Bacon, in describing a reception at which he was present, refers to a chair with "a table and carpets before it," meaning small carpets or rugs, which were then imported and considered very choice, straw and rushes being good enough for common wear. The first departure from this primitive manner of weaving was the insertion with the fingers of little tufts of woolen yarn between the threads of the warp. The same painfully slow process is employed at the present day in the manufacture of the famous Gobelin tapestries. In the South Sea islands the grass-mats made by the natives are noted for fine quality and brilliancy of coloring. In Japan a peculiar kind of rush is found, soft and elastic. In China floor-mats are made of a kind of grass cultivated in the south, and table-mats are made of rattans and rushes; the familiar Canton matting and Japanese mats being also made of rushes. In Spain and Portugal they are made from reeds and rushes, and in Russia the manufacture is a branch of common industry. It is used for packing all their exports, and is made of the bark of the lime or linden tree, sometimes called "bast," which calls the whole people into the woods in the early summer to collect the bark, especially in the dominion of Viatka and adjoining districts. The bast trees of n. Europe (the linden or basswood of the United States), used also in the culture of bees, supply an inner bark, which, made into strands and woven and twisted into the required form, are called bast mats or Russia matting. The mats are usually from 1½ to 2 yards square, and are of great importance in the manufacture and exports of Russia, the exportation in one year amounting to 14,000,000 mats. In America bast from the linden is sold for tying plants in grafting. In Russia the bast is prepared by steeping the bark in water for a few days, taking it from young and tender trees. After the steeping process its layers readily come apart, and are used for different purposes according to their texture. In Spain and Portugal esparto grass, a species of rush found in the s. of Spain, is used principally for the manufacture of cordage, but is said to make beautiful mats. Sugar and grain imported from the Mauritius comes packed in mats made of leaves. India matting is woven from *papyrus corymbosus*, according to Simmonds, by others said to be *papyrus Pangorei*, a kind of sedge resembling grass, but with a solid stem.

MAT'ADOR (Spanish, "slayer"). See BULL-FIGHT.

MATAGORDA, a co. in s.e. Texas, having the gulf of Mexico for its s. and s.e. boundary, the Matagorda bay in the extreme s., and Live Oak bay in the s.e.; drained by the navigable Colorado river, flowing through it centrally and emptying into Matagorda bay; 1300 sq.m.; pop '80, 3,940—3,735 of American birth, 2,520 colored. It is bounded on the e. and s.e. by San Bernard creek. Its surface is generally level, and has a good supply of timber, oak, and cedar; the pecan, hackberry, and other tropical trees grow on the river banks, the alluvial soil of which as well as the rich sandy soil of the level prairies, furnishes nutritious grass, and produces corn, tobacco, cotton, wool, sweet potatoes, butter, and sugar cane. Seat of justice, Matagorda.

MATAGOR'DA, a sea-port and bay on the gulf of Mexico, at the mouth of the Colorado river, Texas, United States of America, 80 m. w.s.w. of Galveston, an important outlet of a country rich in cotton, sugar, rice, etc. The town was destroyed by a storm in 1854, but has been rebuilt, and contains a population of about 2,000.

MATAGORDA ISLAND, a long, sandy island in Calhoun co., Texas, separating Espiritu bay from the gulf of Mexico; lat. 28° 20′ 49″ n., long. 96° 23′ 30″ west. On its northern end, near Pass Cavallo, is an iron light-house with a flashing light.

MATAMO'RAS, a river-port of Mexico, in the department of Tamaulipas, is situated on the s. bank of the Rio Grande, 40 m. from the mouth of that river in the gulf of Mexico. Pop. 20,000. The chief exports are specie, hides, wool, and horses; the chief imports, manufactured goods from Great Britain and the United States.

MATAMOROS, MARIANO, 1770–1814; of Mexican birth; very little is known of his early life or education. He is first heard of as a priest at a small village called Jantelоco, in the district of Cuernuraca, but in 1811, aroused by the constant atrocities and insults of the Spanish troops, he joined the army of insurgents under command of the patriot, Morelos. By him he was given the rank of col., and took a most important part in the battles of Cuantla (1812), Oaxaca, and most notably at the victory of San Augustin del Palmar (1813), which was due almost entirely to his military genius. Had his nominal superiors relied implicitly on Matamoros's judgment as a gen., the issue of the revolution might have been reversed; but rashly attempting the attack on Valladolid, the Mexican leader's forces were routed and "the right hand of Molero," as Matamoros was popularly named, captured and shot at the city of Valladolid, Feb. 13, 1814. His

name has been bestowed on the large city of Matamoros, on the banks of Rio Grande, and upon many smaller towns and districts of the country. By the historians of the time he is regarded as, of all the revolutionary leaders of the period, the one best fitted, from a military point of view, to command success.

MATANZAS, a fortified t. and sea-port on the n. coast of the island of Cuba, 55 m. e. of Havana, with which it is connected by railway. It is situated in an exceedingly rich and fertile district, has an excellent, well-sheltered harbor, and a pop. of 36,000. After Havana, it is the most important trading place on the island.

MATAPAN, CAPE. See CAPE MATAPAN, *ante*.

MATARO', a flourishing city and seaport of Spain, in the province of Barcelona, 17½ m. n.e. by railway from the city of that name. There are here cotton-spinning mills, several of which are driven by steam, sailcloth factories, tanneries, several iron-foundries. Pop. 17,500. At the harbor, there are docks, at which ship-building is carried on.

MATCHES, pieces of various inflammable materials prepared for the purpose of obtaining fire readily. One of the first forms of this useful article was the brimstone match, made by cutting very thin strips of highly resinous or very dry pine-wood, about 3 in. long, with pointed ends dipped in melted sulphur; thus prepared, the sulphur points instantly ignited when applied to a spark obtained by striking fire into tinder from a flint and steel. This was in almost universal use up to the end of the first quarter of the present century, when several ingenious inventions followed each other in rapid succession, and displaced it so completely that it would be now very difficult to purchase a bunch of brimstone matches. The first of these inventions was the "instantaneous-light box," which consisted of a small tin box containing a bottle, in which was placed some sulphuric acid with sufficient fibrous asbestus to soak it up and prevent its spilling out of the bottle, and a supply of properly prepared matches. These consisted of small splints of wood about 2 in. long, one end of which was coated with a chemical mixture, prepared by mixing chlorate of potash, 6 parts; powdered loaf sugar 2 parts, powdered gum-arabic, 1 part; the whole colored with a little vermilion, and made into a thin paste with water. The splints were first dipped into melted sulphur, and afterwards into the prepared paste. They were readily inflamed by dipping the prepared ends into the sulphuric acid. There were several disadvantages in this invention, especially those arising from the use of so destructive a material as sulphuric acid, which also had another drawback: its great power of absorbing moisture soon rendered it inert by the absorption of moisture from the atmosphere. The lucifer match succeeded the above, and differed materially: the bottle of sulphuric acid and all its inconveniences were dispensed with; the match was either of small strips of pasteboard or wood, and the inflammable mixture was a compound of chlorate of potash and sulphuret of antimony, with enough of powdered gum to render it adhesive when mixed with water, and applied over the end of the match, dipped as before in melted brimstone. These matches were ignited by the friction caused by drawing them through a piece of bent sand-paper. So very popular did these become, that although they have since passed away like their predecessors, they have left their name behind, which is popularly applied to other kinds since invented. Next to the lucifer in importance was the congreve, which is the one generally used at present. The body of the match is usually of wood, but some, called vestas, are of very thin wax-taper. The composition consists of phosphorus and niter, or phosphorus, sulphur, and chlorate of potash, mixed with melted gum or glue, and colored with vermilion, red-lead, umber, soot, or other coloring material. The proportions are almost as varied as the manufacturers are numerous. The congreve match requires only a slight friction to ignite it, for which purpose the bottom or some other part of the box is made rough by attaching a piece of sand-paper, or covering it, after wetting it with glue, with sand. Amadou, or German tinder, is largely made into congreve matches or fusees, as they are often called, for the use of smokers to light their pipes or cigars. One of the latest and best introductions is that of Bryant and May, which is properly called the "special safety match." With every variety of lucifer and congreve, there are certain dangers attending the use, for in both a slight friction will ignite them, and as, from the very nature of their application, they are apt to be carelessly thrown about, they are consequently exposed to the risk of accidental friction, and have doubtless been the cause of numerous and serious conflagrations. The congreves are exposed to further risks of accidental ignition arising from the employment of phosphorus, which, from its very inflammable nature, will ignite spontaneously if the temperature is a little higher than ordinary. The match of Messrs. Bryant and May, although a new introduction, was invented in Sweden, under the name of the Swedish safety match, by a Swede named Lundstrom, a large manufacturer of matches at Jönköping, in 1855 or 1856, and patented in this country by the firm above mentioned. The only essential difference from the congreves is in leaving out the phosphorus from the composition applied to the match, and instead, mixing it with the sand on the friction-surface, thus separating this highly inflammable material from its intimate and dangerous connection with the sulphur and chlorate of potash. This simple invention seems to have removed all the objections from the use of this class of matches. They light "only on their own box."

Many ingenious inventions have been introduced for making the wooden splints.

The square ones, which have always proved to be the best, are cut very simply by two sets of knives acting transversely to each other. The round ones, which always have the fault of weakness, are cut by a perforated steel plate invented in 1842 by Mr. Partridge. The perforations are the same size as the splints; and their edges are sufficiently sharp, when pressed on the transverse section of the wood, to cut down through it. The various ornamental forms of the German match-makers, who excel in this manufacture, are produced by planes, the irons of which are so constructed as to plow up splints of the form required. These are usually made of a soft kind of pine wood—that of *abies pectinata* is preferred in Austria and Germany—of which vast quantities are yielded by the forests of upper Austria. Until the introduction of amorphous phosphorus (see PHOSPHORUS), the trade of match-making was fearfully unhealthy; the emanation of phosphoric acid, when common phosphorus was used, gave rise to necrosis, or mortification of the bones, and fatal effects often followed. Too many manufacturers are still using the common kind for cheapness, but others avoid the injury to their work-people by employing the amorphous kind. This, and other dangerous manufactures, demand legislative interference.

The trade in matches has assumed enormous dimensions, especially in Germany, where vast quantities are exported. One firm, having its principal establishment at Schüttenhofen in Bohemia, employs 2,700 persons in this manufacture; more than one firm in England produces 10,000,000 congreve matches per day; and a Birmingham firm manufactures daily 8 miles of thin wax-taper, and converts it into congreve matches. Indeed, so wonderfully has match-making developed itself that in this country more thousands are now engaged in it than there were hundreds of persons who found employment in making the brimstone matches formerly.

MATCHLOCK. See LOCK.

MATE (allied to *meet*, measured, suitable, conformable, equal, companionable) is an assistant, a deputy, or a second in any work; in this sense it is a common word in nautical affairs. In the navy its use is now confined to petty officers, such as boatswain's mate, gunner's mate, etc.; but formerly several officers bore the title, as master's mate, now second master, surgeon's mate, now assistant-surgeon. Until within a few years the distinctive term *mate* survived, and was applied to a grade between lieutenant and midshipman: the title is now changed to *sublieutenant* (q.v.).

In the merchant-service the mates are important officers, holding functions not greatly inferior to those of lieutenants in the royal navy. The first mate ranks next to the master or captain, commands in his absence, and is immediately responsible for the state of the vessel; the second and third (and fourth in large well-found vessels) have various analogous duties, the junior mate generally having the superintendence of the stowage of the cargo.

MATÉ, or PARAGUAY TEA, a substitute for tea, extensively used in South America, and almost universally through Brazil. It consists of the leaves and green shoots of certain species of holly (q.v.) more especially *Ilex Paraguayensis*, dried and roughly ground; the leafy portion being reduced to a coarse powder, and the twigs being in a more or less broken state, sometimes, however, as much as an inch in length. The term *maté*, which has by usage attached to this material, belonged originally to the vessels in which it was infused for drinking; these were usually made of gourds or calabashes, often trained into curious forms during their growth. Into the hollow vessels thus formed a small quantity of the material, more properly called *yerba de maté*, is put, and boiling water is added; it is then handed round to those who are to partake of it; and each being provided with a small tube about 8 in. in length, with a small bulb at one end, made either of basket-work of wonderful fineness, or of perforated metal, to act as a strainer, and prevent the fine particles from being drawn up into the mouth, dips in this instrument, which is called a *bombilla*, and sucks up a small portion of the infusion, and passes the maté-bowl on to the next person. It is usual to drink it exceedingly hot, so much so as to be extremely unpleasant to Europeans. Its effect is much the same as tea, stimulating and restorative; and it derives this property from the presence of a large proportion of the same principle which is found in tea and coffee—viz., *theine*. The collection and preparation of maté is a large industrial occupation in Paraguay and Brazil; and the learned and accurate botanist Mr. John Miers has proved that not only *Ilex Paraguayensis*, but also *I. curitibensis*, *I. gigantea*, *I. ovalifolia*, *I. Humboldtiana*, and *I. nigropunctata*, besides several varieties of these species, are in general use. It is very remarkable that when caffeic acid, to which coffee owes its agreeable flavor, independently of the theine, is treated with sulphuric acid and binoxide of manganese, it forms kinone; and by treating the maté with the same agents, kinone has also been obtained.

Upwards of 5,000,000 lbs of maté are annually exported from Paraguay to other parts of South America; but it is not yet an article of export to other quarters of the world.

Ilex Paraguayensis is a large shrub or small tree; with smooth, wedge-shaped, remotely serrated leaves, and umbels of small flowers in the axils of the leaves. The leaves of many species of holly possess properties very different from those of the maté trees. Some are emetic.

MATELICA, a t. in the province of Macerata, or, as it is sometimes called, *Macerata-e-Camerino*, one of the former papal states and a part of the district known as the Marches. It is a walled town of from 3,000 to 3,500 inhabitants, situated on the San Angelo river and not far from 25 m. s.w. of the town of Macerata. The place contains several convents and churches. The inhabitants are chiefly engaged in agriculture, the raising of fruit, and, to a small extent, in woolen manufactures.

MATERA, a c. of the Italian province Potenza, situated between lovely valleys, 37 m. w. n. w. of Taranto. Pop. 14,225. It has an episcopal palace, a cathedral, and a college, but its lower classes are reputed the most uncivilized of southern Italy; they dwell chiefly in ancient caverns, excavated in the side of the deep valley surrounding the town, and are much afflicted with cretinism. Matera has manufactures of leather and arms, and a trade in nitre and agricultural produce.

MATERIAL CAUSE, in metaphysics, is the first in order of the four kinds of causes which Aristotle points out, and which later philosophers generally adopt. As thus defined it is the physical basis for the existence of a thing; or, in other words, the matter of which the thing is made. The material cause of a thing is, consequently, to some extent the thing itself; for example, it has been said that the material cause of a marble statue is marble, yet of any particular block of marble, parts must be cut away in order that the finished statue may appear.

MATERIALISM. This the name for a certain mode of viewing the nature of mind, namely, to regard it either as mere matter, or as a product of the material organization. The opposite view is called spiritualism, and means that the mind, although united with the body, is not essentially dependent on bodily organs, but may have an existence apart from these. There has been much controversy on this question; and although in later times the immateriality of the mind has been the favorite view, and been treated by many as a supposition essential to the doctrine of man's immortality; yet, in the earliest ages of the Christian church, the materialistic view was considered the most in unison with revelation, and was upheld against the excessive spiritualizing tendencies of the platonic schools. Tertullian contended that the scriptures prove, in opposition to Plato, that the soul has a beginning, and is corporeal. He ascribes to it a peculiar character or constitution, and even boundary, length, breadth, height, and figure. (This last view is incompatible with the definition of mind. See MIND.) To him, incorporeity was another name for nonentity (*nihil est incorporale, nisi quod non est*); and he extended the same principle to the Deity, who, he conceived, must have a body. He could not comprehend either the action of outward things on the mind, or the power of the mind to originate movements in outward things, unless it were corporeal.

The state of our knowledge at the present time shows us more and more the intimacy of the alliance between our mental functions and our bodily organization. It would appear that feeling, will, and thought are in all cases accompanied with physical changes; no valid exception to this rule has ever been established. Mind as known to us, therefore, must be considered as reposing upon a series of material organs, although it be totally unlike, and in fundamental contrast to, any of those properties or functions that we usually term material—extension, inertia, color, etc. We never can resolve mind into matter; that would be a confounding of the greatest contrast that exists in the entire compass of our knowledge (see MIND); but we are driven to admit, from the whole tenor of modern investigation, that the two are inseparably united within the sphere of the animal kingdom. "Our consciousness in this life is an *embodied* consciousness. Human understanding and belief are related, in a variety of ways, to the original and successive states or the bodily organism from birth to death. Observation and experiment prove the important practical fact that the conscious life on earth of every individual is dependent on his organism and its history" (professor Fraser's *Rational Philosophy*). See Lange's able *Geschichte des Materialismus* (Eng. transl. 1877).

MATERIALISM (*ante*). One difficulty in treating this subject is that of giving a definition of the term satisfactory to all parties. Webster defines a materialist as "one who denies the existence of spiritual substances, and maintains that the soul of man is the result of a particular organization of matter in the body." Knight's English cyclopædia defines materialism as "a name applied to any philosophical system which denies the existence of a spiritual or immaterial principle in man, called the mind or soul, distinct from matter; or in other words, denies the immateriality of the soul." The *Encyclopædia Britanniea* says "materialism is the name given to that speculative theory which resolves all existence into a modification of matter." The latter definition is practically the most comprehensive and correct, although some materialists might with justice object to it without modification, for there are those who are practically materialists, if they do not call themselves such, who do not deny the existence of God, at the same time that they maintain that matter contains within itself—either endowed, or originally possessing—properties by which it is capable of transforming itself into the various forms of life, and moreover that this power is not essentially the active presence of Deity. The belief of the union or the unity of God and matter is pantheism (q.v.). It is common to denote the opposite doctrine to materialism by the term idealism; but this fails to make sufficient distinction, and is not as appropriate as the word spiritualism in

its proper sense, as used to designate a belief in a spiritual being who created the universe and controls its phenomena by laws or by continuous force, and who has moreover endowed certain of the higher animals with certain degrees of intelligence, giving to man especially intellectual powers which are generally believed to result from the possession of an immaterial and immortal spirit separate from the divine, which, upon the dissolution of the body, is to continue its existence in another world, and, moreover, as those who accept divine revelation believe, is to be rewarded or punished. The terms materialism and materialist have often been misapplied, and it is sometimes difficult to form an opinion as to whether the views of some of the ancient, as well as modern philosophers are essentially materialistic or not. Democritus is usually classed as a materialist; but such a disposal of his philosophy cannot accord with a rational treatment of the subject of materialism as it meets us to-day, for one of his propositions is as follows: "The soul consists of fine, smooth, round atoms, like those of fire. These atoms are the most mobile, and by their motion, which permeates the whole body, the phenomena of life are produced. Democritus also believed that this matter was distributed throughout the universe, producing the phenomena of heat, light and life. Epicurus, who may be considered in some respects as a follower or disciple of Democritus, taught that the soul was a fine substance, distributed through the whole mass of the body, and most resembles the air, with an infusion of warmth. This soul was not, however, immortal, but ceased to live on the dissolution of the body; but it was something superior to the matter of the body. This, therefore, was at least a modified form of materialism, and not that which invests the matter of the body itself with vital and intellectual power. It was not so spiritual a doctrine as that held by Socrates and Plato, the soul, according to them, being indestructible and devoid of all grossness. The author of the article "Materialism" in Knight's English cyclopædia says: "The systems to which the name materialism is applied may be roughly distributed under a threefold division. First, it is applied to a system (like that of Hartley) which admits the existence of a soul, but which, attempting to explain mental phenomena physically, or by movements arising out of the bodily organization, seems to imply materialism. Secondly, it is applied to the system of Hobbes and Priestly, and of the French school of writers of which De la Mettrie may be taken as a specimen, which distinctly deny the existence of a soul as a separate principle in man, but which do not deny either a God or a future state. In the systems of these writers is evolved the pure and proper idea of materialism divested of all unnecessary consequences. Thirdly and lastly, the name is applied to systems like that of the ancient Epicureans, which deny both a future state of rewards and punishments, and a divine creator, systems for which atheism would be the better name, inasmuch as materialism fails to denote their more important and distinctive ingredients." Upon further mention of Priestly this writer says: "He does not deny the immortality of man and a future state of rewards and punishments. On the contrary, he distinctly affirms these on the authority of Scripture. It is needless to add that Dr. Priestly does not deny the existence of a God." It is therefore perceived that there are various ideas as to what constitutes materialism.

It would be unprofitably occupying the space assigned to this article to undertake even to give a summary of the history and development of the various theories connected with the doctrine of materialism. Its history is found scattered through various writings, much of it embodied in the biographies of the various philosophers who have from time to time in all ages propounded theories; in philosophical histories of different epochs and nations; in philosophical and religious disquisitions and sermons; in various works on metaphysics and philosophy, and in systematic histories. No attempt will therefore be made even to assign many of those who have written upon the subject their just and proper position. It would be impossible to give a fair representation of their views in a few pages, when long dissertations have failed. As far, therefore, as regards the history of the subject the reader is referred to the various biographical notices of persons which may be found in this work, such as Democritus, Pythagoras, Socrates, Plato, Aristotle, Lucretius, Empedocles, Epicurus, Bacon, Locke, Hobbes, Berkeley, Gassendi, Descartes, Leibnitz, Kant, Spinoza, Hegel, Holbach, and Priestly, and to the accessible works of these philosophers, as well as to those of more modern authors, on both sides of the subject, metaphysicians and scientists, such as sir William Hamilton, Paley, Jonathan Edwards, Mark Hopkins, Charles Hodge, Edward Hitchcock, Maudsley, Herbert Spencer, Huxley, Tyndall, James D. Dana, John W. Draper, William B. Carpenter, Joseph Le Conte (*Religion and Science*), Bastian, Lionel Beale, Hermann Lotze, Heckel, Charles Darwin, and Du Bois Reymond, and to Lewes's *History of Philosophy*, and Lange's *History of Materialism*.

What are the evidences in favor of materialism, what are the evidences against it, and what is the nature of these evidences? On the one hand, physical examination fails to find, or at least to demonstrate, any physical power in the living organism which cannot be accounted for by correlation of physical forces, and it is contended that the performances of various functions follow each other consecutively, according to external circumstances. As far as the doctrine of evolution may be made use of to favor that of materialism, it is contended that geology and zoology furnish evidence of the gradual progression in development from lower to higher forms of life. There are connecting-links, it is asserted, which show that one form of animal organization has been trans-

formed into another. In some of the lower crustaceans particularly, the transformations are held to be quite evident. In the cœlenterata (jelly fishes, etc.) various metamorphoses and alternations of generations occur (see GENERATIONS, ALTERNATION OF) which are held as evidence of the power of evolution possessed by protoplasmic matter. Geology is claimed to have given a verdict in favor of progressive development in the discovery of fossils of the horse family in tertiary formations from the eocene up to the quaternary period (see HORSE, FOSSIL). The experiments of several scientists with vegetable infusions for a long time seemed to show that animal organisms could be developed in dead organic matter containing no living germs, but recently it has been shown that when proper precautions are taken to exclude all atmospheric germs and also to destroy all living matter contained in the infusions, no development of life takes place. A recent writer remarks: "Numerous questions have arisen from time to time through the conflicts of materialism with opposing doctrines, and it will be found that these questions have been brought to definite issues, in our day, for final settlement." This is either hoping for too much or for a questionable result. It is more probable that human investigation will never bring the question to a settlement, but that it will ever elude the grasp of the investigator, and it is probably a wise provision that it is so. It is a conflict out of which flows the most beneficial effects upon human character and understanding; for it is a law of nature that all our faculties, physical as well as mental, are strengthened and more perfectly developed in combating with opposing forces. No machine, intellectual or physical, can accomplish work without opposing force or *resistance*. Moreover, if we possessed complete evidence that we totally perished when our bodies underwent dissolution, or that our spirits were immortal, coupled with a foresight of our destiny, no beneficial result could follow, but we would, with the natures we now possess, perhaps be rendered miserable. One of the principal evidences which have been brought forward against the doctrine of materialism is the almost universal aspiration after a future life. Dr. John William Draper, in his *History of the Conflict between Religion and Science*, says: "Nature has thus implanted in the organization of every man means which impressively suggest to him the immortality of the soul and a future life." But this is a belief and will probably always continue a belief. Leibnitz attempted to prove the immortality of the soul by his doctrine of monads, but probably no writer has furnished more ideas to fortify the doctrines of materialism than he; the essence of his doctrine was indeed materialistic. The atom produces its own sensations from itself, and it develops itself in accordance with its own internal laws of life. Every monad is a world to itself, and no one is like another, but the ideas of all the monads consist in an eternal system, in a complete harmony, which was ordained from the beginning of time, and which constantly persists through the continuous vicissitudes in all the monads. Every monad represents to itself, confusedly or clearly, the whole universe, the whole sum of all that happens, and the sum of all the monads in the universe. The monads of inorganic nature have only ideas which completely neutralize themselves, as those of a man in a dreamless sleep. The monads of the organic world are higher, the lower animals being formed of dreaming monads. In the higher, they have sensation and memory, and in man they have thought. Lange observes: "The monads with their preestablished harmony reveal to us the true nature of things as little as the atoms and the laws of nature. They afford, however, a pure and self-contained conception of the world, like materialism, and do not contain more inconsistencies than this system. But what especially secured the popularity of the Leibnitzian system is the ductile looseness of its notions, and the circumstance that its radical consequences were much better marked than those of materialism. In this respect nothing is more useful than a thoroughgoing abstraction. The tyro who shudders at the thought that the ancestors of the human race might once have been compared with the apes of to-day, comfortably swallows down the monad theory, which declares the human soul to be essentially like all the beings of the universe, down to the most despised mote, which all mirror the universe in themselves, are all small divinities to themselves, and bear within them the same content of ideas, only in various arrangement and development. We do not immediately observe that the ape monads are also included in the series, that they are as immortal as the human monads, and that they may yet, perchance, in the course of development, attain to a beautifully ordered content of ideas. . . . It is very much the same with the much-extolled and much-abused optimism of Leibnitz's system. Viewed in the light of reason, and tested by its real presuppositions and consequences, this optimism is nothing but the application of a mechanical principle to the foundation of the facts of the world. God, in choosing the best of possible worlds, does nothing that would not be quite mechanically produced if we suppose the essences of things to act upon each other. In all this, God proceeds like a mathematician in solving a problem, and he must so proceed, because his perfect intelligence is bound to the principle of sufficient reason—in the result it all comes to the same thing as if we were to deduce the development of the universe from the mechanical presuppositions of a Laplace and a Darwin." (Lange, *History of Materialism*. Boston: Houghton, Osgood & Co., 1880, pp. 130, 131, 132.) The question ever recurs, how can matter produce thought? The assertion by Leibnitz that it is the inherent principle of the monad, it is contended, is only an assertion, a product of the imagination, and the doctrine that a certain combination of atoms produces it, is likewise held to be just as much the result of imagination. That

it requires organization to produce manifestations of thought, which we, as physically constituted beings, can comprehend or perceive, is a necessity of the case, and a condition which limits human knowledge. We cannot make a physical demonstration of a purely spiritual subject. If the mind acts or exists without the intervention of matter we are necessarily unconscious of it, and are obliged to search for other evidences than material phenomena, and for the advocate of the production of thought by the correlation of atomic energy to demand that the spiritualist shall accept only physical evidences is equivalent to the dictating the limits of controversy. Four thousand years of experience and 2,000 years of controversy have not settled the question. Perhaps if an instance could be cited in which rapidity of thought had far outstripped all the possibilities of physical methods, it would furnish strong evidence of the immateriality of the human mind, unless, indeed, we adopt Leibnitz's doctrine of monads. Have there been such instances? Is it possible that there ever was a case in which the nervous mechanism, or a part of it, admitted a perfectly unobstructed performance of an intellectual function by the immaterial principle or mind? Can we account in any other manner for the remarkable mathematical calculating powers of Zerah Colburn (q.v.), who could answer accurately, almost in an instant, such questions as the following, and others much more difficult: How many seconds are there in 11, 15, or 16 years? What is the square of 999,999? etc. This is an instance of the almost perfect adaptability of nervous organization to its uses. It is so much in excess of ordinary—what we term, perhaps improperly—normal mental activity, that it becomes a question whether we are not compelled to regard it as the result of the comparatively unobstructed operations of a spiritual intelligence. The fact that this remarkable talent left him at about the age of 21 would be explained by a spiritualist in one way, and by a materialist in another. An unsolvable question is always capable of receiving opposite explanations. The probabilities may very greatly preponderate to one side, but they are not sufficient to convince, and the most sincere minds may be so constituted as to form opposite conclusions. When the experiments in spontaneous generation above alluded to were shown to be faulty, it was believed by many that the doctrine of evolution, as well as that of more decided materialism, had received a severe blow, but an evolutionist was among the foremost in demonstrating the failure of spontaneous generation, and the majority of evolutionists are probably opposed to the doctrine of spontaneous generation. The results of such experiments do not, however, affect permanently either the doctrine of evolution or of materialism or spontaneous generation. If spontaneous generation ever takes place, it may require conditions which are incompatible with the sealing of boiled infusions in flasks, or their protection from the descent of atmospheric germs by the bending down of open capillary beaks of the flasks. But if it could be satisfactorily proved that spontaneous generation never occurs, it would not aid the establishment of the doctrine of spiritualism. The truth is that the nature of the question does not admit of physical or experimental proof, and, indeed, does not seem to be affected by geological evidence.

The argument for the existence of an intelligent spirit independent of the body, and not subjected to the variations of its physical functions, must, from the necessity of the case, be carried on by the reasoning powers, with perhaps some reliance upon physiological facts as means of explanation; but the most important part of the argument, leaving out the question of a revelation, rests upon the evidences of design. If it is admitted that the works of nature furnish such evidence, then there is a Being whose attributes must be such as to make it probable that the mind of man has not been endowed with intellectual powers and aspirations which are destined to end in nothingness. To maintain that inorganic matter could have arranged itself in the various living forms with all the adaptations of means to ends, both as regards use and beauty, because the Creator does not manifest himself in person, because we are not permitted to perceive him with our senses, is, as Paley has logically said, quite as inconsistent as to deny that a watch is the product of mechanical design merely because the process of its construction had not been the subject of personal observation. The processes of nature do, indeed, take place in ways that are perfectly mysterious and unknown to us. Certain invariable effects are called laws, but the secret springs by which those laws are executed are entirely beyond our ken. We call a certain force the attraction of gravitation, but what, in reality, that attraction is, is no more known to us than if we had not learned to measure or to trace the paths of the planets. We cannot cast aside the evidence furnished by inexorable logic, and that logic tells us that if circumstantial evidence is of value, all matter is moved by supernatural power. Leibnitz and others thought they had discovered that power as residing in the matter itself, but others, and among them perhaps the most acute and broadly observing experimental philosopher the world has ever known, Faraday, have placed it in points and lines of force, for the purpose of giving a scientific expression to certain facts, at the same time acknowledging their utter inability to come any nearer a solution. Faraday, in a lecture on mental education, in 1854, used the following words: "High as man is placed above the creatures around him, there is a higher and far more exalted position within his view; and the ways are infinite in which he occupies his thoughts about the fears, or hopes, or expectations of a future life. I believe that the truth of the future cannot be brought to his knowledge by any exertion of his mental powers, however exalted they may be; that it is made known to him by

other teaching than his own, and is received through simple belief of the testimony given." Here is the testimony of one of the most rigid of scientific investigators that the highest evidence of spiritual existence is internal; and why, we may ask, may not such evidence, coming as it does from hundreds of thousands of all classes of persons, the most highly cultured as well as others, be received as well as speculations about the properties of protoplasm or of monads? If unanimity of testimony is of value, certainly there is more of it among the thousands who believe than among the disputants in the scientific arena. But we dismiss all these points with the remark that although, as Faraday says, in a subsequent sentence to the above, that man by reasoning cannot find out God, he is compelled to use his reasoning powers in the study of nature in such a way as to lead him to adopt the best methods of forming a belief as to his relations to time, as well as his present surroundings. The world is full of what to the human understanding are inexplicable facts. Certain persons perform the most irrational acts, not only those which appear to the ordinary understanding to be irrational, but which, according to all the laws of mental philosophy, are known to be irrational; and yet we can give no satisfactory explanation of them. To say that the organism is deranged proves nothing for either side of the question, for the mind, it may be said by one, requires an instrument not deranged to manifest itself, while the other contends that rational thought can only be *produced* by an organism which retains to a certain degree the harmony of its parts, or, in other words, which possesses certain physical relations. In either case, whether the brain is the instrument or the producer of thought, it requires to be in order, and it will be seen that an attempt to demonstrate either the presence or the absence of spiritual power will fall short of actual proof, and that the best we can do is to form a well-founded belief. The great fact that design is stamped upon all the works of nature, must always be borne in mind. We can conceive of no designing power independent of Him whom we call Providence or God, and when we acknowledge his existence we are forced to admit that his creatures must have been the subject of his care, and that he has not left them to grope in blindness throughout all the ages of their past existence without a light more than that which can be furnished by physico-scientific investigations. What, then, it may be asked, is the value of physical research? Its proper fruits or objects, if we reason from analogy and observe the beneficent provisions of surrounding nature, are intellectual enjoyment and the cultivation of a faith, that highest attainment of the understanding, which rests with confidence upon the eternal justice of the unseen government of the universe, and which shall finally show to mankind that their highest aspirations are not idle dreams produced by selfish or morbid longings which have no foundation in the constituted order of nature.

We see in nature the most perfect adaptation of means to ends. The mechanism of the human body perhaps offers the most perfect examples of this. The mechanism of the human hand has furnished a subject for one of the most profound and elegant of the Bridgewater treatises, by sir Charles Bell, and the contrivances found in the structure of the eye are still more illustrative of design. The evidence, however, offered in some of the lower forms of animals, are, as being simpler, more conclusive to the non-scientific observer. We walk along the sea-beach and pick up a mollusk which has recently been washed ashore or dug out of the sand. We remove the shell from the animal, and perceive that its hinge is cased over and interlaced with an elastic, gluey substance, which not only serves to assist in holding the shells in place, but by their elasticity to open them. In some cases the materialist, or the evolutionist might suppose that the living molecules in a certain part of the mollusk might, in accordance with certain physico-vital properties, arrange themselves for the purpose of accomplishing what might be termed an impending function, or a function becoming immediately necessary for the purposes of evolution or further development; but we open another species of bivalve mollusk, and instead of the mere addition or coating of a little elastic glue, we find at the hinge in either shell a chamber, hollowed out as by a mechanical instrument, and occupying the space so formed by the two little cups, an independent and detached elastic pad whose action is that of a spring in opposition to the muscles which close the shells. Nobody can make the examination without being almost startled at what, without irreverence, might be called the legible autograph of the Creator's hand. It is impossible to conceive how any process of gradual evolution, or of abrupt self formation, if such a phenomenon can be imagined, could bring about such a result. Now, it is not within the possibilities of science to demonstrate whether this mechanism has been brought about by the voluntary act of the Creator or by evolution. We are, therefore, left to adopt the most reasonable, the most probable, conclusion; and it is here, perhaps, that people will always differ. Some will contend that evolution is the only natural process of creation, while the mass of mankind will probably always think that the wonderful works of nature are too vast, too mighty, to be the production of anything less than omnipotent design.

Philosophers have been censured by believers in Bible revelation for sometimes calling the human body a human machine; but if the soul is independent and superior to the body, then the body must be a machine. Looking upon the subject in this light we can explain the influence of education, and also why the mind cannot manifest itself till its instruments, the parts of the nervous mechanism, are properly prepared. A perfectly intelligent soul might inhabit the body and yet not be able to manifest itself. Further

than this it has so far been, and will probably always continue to be, unavailing to attempt to reason upon this subject with the expectation of producing any positive evidence of the existence of a spiritual nature. This is the point at which belief or disbelief is adopted, and upon the foundation of either of these conclusions man's reason may continue to build systems, which, indeed, from the influence they exert upon the individual and upon society, may furnish evidences of their correctness or falsity. To be able to have a clearer view of the unseen world than that which science or logic offers, the veil which conceals the truth from us must be lifted, or we must believe it has been lifted, that a revelation has been made, and that the human race has not been obliged to live for thousands of years with no light except that furnished by human reason—that reason, notwithstanding its wonderful powers, which we often have cause to distrust, since the most powerful intellects have come to such opposite conclusions, starting from the same premises. To what extent is it reasonable and just to place ourselves under the guidance of faith? In the discussion of human affairs we perceive that it is one of the noblest of qualities, and that without it society would be a thousand times worse than the severest pessimist asserts. Therefore faith is one of the fundamental principles of our nature, and by no means to be excluded from the elements of evidence which we are to examine in forming an opinion as to whether this is a spiritual as well as a material world, and all the reasoning which might be attempted could never prevent the mass of mankind from resting on a foundation which ministers to their hopes, their sentiments, their affections; but, on the other hand, all the persuasive eloquence of the most exalted zeal of thousands of the believers in the spirituality of man's nature will be powerless in the presence of the restless efforts of many earnest and sincere minds, who cannot find it in their natures to relinquish the search after a truth which their opponents tell them can be found only by the aid of faith.

MATE'RIA MED'ICA is that department of the science of medicine which treats of the materials employed for the alleviation and cure of disease. Some writers, as Pereira, divide the subject into the inorganic and the organic, while others, as Christison, adopt an alphabetical arrangement. In the description of an inorganic compound, as, for example, iodide of potassium or calomel, the writer on materia medica notices (1), its physical properties; (2), its various modes of preparation; (3), its chemical composition and relations, including the tests for its purity, and the means of detecting its probable adulterations; (4), its physiological action on man and animals in large and small doses; (5), its therapeutic actions and uses, and the average doses in which it should be prescribed; and (6), the officinal preparations containing the substance in question, and their uses and doses: while in the notice of an article belonging to the organic department, the natural history of the source from whence it is obtained, and the mode of collecting or extracting it, must also be given.

MATHEMATICAL INSTRUMENTS include all those instruments employed in the determination of the length of lines or the size of angles. Pairs of compasses, surveying-chains, etc., are examples of the former class; while the compass, sextant, theodolite, and the numerous list of astronomical instruments generally denominated telescopes, including the equatorial transit instrument, mural circle, etc., form the latter class. The more important of these instruments will be treated of under separate heads.

MATHEMATICIANS (Lat. *mathematici*), the name given by the Romans to the professors of astrology, from the fact that, in all cases, those who practiced astrology also to some extent cultivated mathematical science. The Romans, unlike the Greeks, appeared not to comprehend the attractions possessed by mathematical studies, and being consequently unable to distinguish between the student of pure science and the fanatic enthusiast who attempted to derive a knowledge of future events on this earth from the position of the stars, joined them together in a common condemnation, under the name of "mathematici."

MATHEMATICS (Gr. *mathema*, learning), the science which has for its subject-matter the properties of magnitude and number. It is usually divided into *pure* and *mixed;* the first including all deductions from the abstract, self-evident relations of magnitude and number; the second, the results arrived at by applying the principles so established to certain relations found by observation to exist among the phenomena of nature. The branches of pure mathematics which were first developed were, natually, *Arithmetic*, or the science of number, and *Geometry*, or the science of quantity (in extension). The latter of these was the only branch of mathematics cultivated by the Greeks, their cumbrous notation opposing a barrier to any effective progress in the former science. Algebra (q.v.), or the science of numbers in its most general form, is of much later growth, and was at first merely a kind of universal arithmetic, general symbols taking the place of numbers; but its extraordinary development within the last two centuries has established for it a right to be considered as a distinct science, the *science of operations*. Combinations of these three have given rise to *Trigonometry* (q.v.) and Analytical Geometry. The Differential and Integral Calculus (q.v.) makes use of the operations or processes of geometry, algebra, and analysis indifferently; the *calculus of finite differences* is in part included under algebra, and may be considered as an extension of that science; and the *calculus of variations* is based upon the differential calculus. The term "mixed mathematics" is calculated to lead to error; "applied mathematics" is a more appropriate name. This

portion of mathematics includes all those sciences in which a few simple axioms are mathematically shown to be sufficient for the deduction of the most important natural phenomena. This definition includes those sciences which treat of pressure, motion, light, heat, sound, electricity and magnetism—usually called *Physics*—and excludes chemistry, geology, political economy, and the other branches of science, which, however, receive more or less aid from mathematics. For a notice of the separate sciences, see ASTRONOMY, OPTICS, MECHANICS, HYDROSTATICS, HYDRODYNAMICS, HEAT, ACOUSTICS, ELECTRICITY, MAGNETISM, etc.

MATHER, COTTON, an American colonial divine, son of Increase, was born at Boston, Feb. 12, 1663. He entered Harvard College when 12 years old, and his precocity and piety excited great expectations. He entered upon a course of fasting and vigils, cured a habit of stammering by speaking with "dilated deliberation," studied theology, became the colleague of his father in the ministry, and wrote in favor of the political ascendency of the clergy. The phenomenon termed "Salem witchcraft" having appeared in the colony, he investigated it, and wrote, in 1685, his *Memorable Providences relating to Witchcraft and Possessions.* He found that devils or possessed persons were familiar with dead and foreign languages, etc., and eagerly advocated the adoption of desperate remedies for the diabolical disease. It is well-known that Mather was responsible for the shedding of much innocent blood; and he himself admitted that "he had gone too far." In 1692, he published *Wonders of the Invisible World,* to which a reply appeared at London in 1700 by Robert Calef—the effect of which was to dissipate the somber and superstitious influence of the New England divine. With a remarkable industry, he wrote 382 works. His *Essays to do Good* have been highly commended by Franklin; and when we think of his misdeeds, which were serious, it ought also to be remembered that he helped to introduce into the States inoculation for the small-pox. He died Feb. 13, 1728. His life was written by his son, Samuel Mather (1729).

MATHER, COTTON, D D. (*ante*), having received his elementary education under his father's care, and at the free school in Boston, was able on entering Harvard college, at the age of 12, to read not only Virgil and other Latin classics, but Homer and Isocrates in Greek. On taking his first degree at the age of 16 the president addressed him in a Latin speech, praising his past conduct and attainments, and predicting a glorious future. The descendant of a long line of ministers, he himself desired to enter the ministry, but an impediment of speech prevented, and he began to study medicine. Having overcome the infirmity he studied theology, and in 1680 became assistant to his father in the North church, Boston, and in 1684 was ordained as co-pastor. While zealous and faithful as a preacher, he found time to write for the press, and published numerous sermons and books on practical piety, at the same time accumulating materials for various intended treatises. He began also the study of some modern languages, among them the Iroquois Indian. He believed that ministers should concern themselves in politics, and, desirous of maintaining the ascendancy of the clergy in civil affairs which had long prevailed, but which he saw declining, he prepared in 1689 the declaration of the people justifying the imprisonment of governor Andros. Sharing in the superstitions of the age, he firmly believed in witchcraft, and suspecting that there were in Boston devotees of Satan, he applied himself earnestly to detect them. An Irish woman having been denounced as a witch, and Mather having no doubt that she was under the influence of an evil spirit, she was tried, condemned, and executed. His book on witchcraft, published with the recommendation of all the ministers of Boston and Charlestown, was entitled *Memorable Providences relating to Witchcraft and Possessions; with Discoveries and Appendix.* It was eagerly read in the colony, and was republished in England with a preface by Richard Baxter; being pronounced perfectly convincing. With magistrates and people Mather urged the necessity of eradicating the sin. In 1692 the children of Mr. Parris, a minister of Salem, becoming strangely afflicted, accused an Indian servant of having bewitched them by her incantations. She was cast into prison, and confessed that she was guilty. The girls began to accuse others of being witches. The magistrates applied to Mather for advice, and he urged the adoption of the most stringent measures. The excitement was intense. By May, in Salem, 100 persons were in jail. The deputy-governor and 5 magistrates went from Boston to conduct the preliminary examinations, and on the arrival of the new charter a special court was appointed to try the accused. Several, though protesting innocence, were declared guilty and hung. Those who confessed their guilt and were penitent, had their lives spared. By September 20 persons had been put to death; 8 more were under sentence of death; 55 had confessed their guilt and escaped; above a hundred more were lying in jail, and twice that number were at large, suspected. The last execution was that of a Mr. Burroughs, formerly a minister at Wells, which made a deep impression on the country. A cry of horror was raised. A reaction began which Mather could not arrest. He drew up, with the concurrence of the governor, the president of Harvard university, and the ministers, an elaborate justification of what had been done, expressing "pious thankfulness to God for justice being so far executed among us," in a work entitled *The Wonders of the Invisible World: Observations upon the Nature, the Number, and the Operations of the Devils.* But it had no effect. In the trials that followed all the accused were acquitted. While some of the judges in the religious assemblies prayed for pardon if they had shed innocent blood, Mather showed no signs of

penitence or regret. In his *Magnalia Christi*, published 9 years afterwards, he indeed admits that perhaps there had been "a going too far in that affair." His influence now declined. Though admitted to be pre-eminent among his countrymen for genius and learning, he was twice passed over in the election of president of Harvard college. But he continued to labor with zeal. He was a voluminous writer. His *Magnalia Christi Americana* was a collection of facts for an ecclesiastical history of New England. Among his other works are *Essays to do Good; Christian Philosopher;* and *Directions to a Candidate for the Ministry.* The work on which he labored from his 31st year to his death is entitled *Illustrations of the Sacred Scriptures*, and the manuscript is now in the library of the Massachusetts Historical Society. He was the first, with Dr. Boylston, to introduce into this country inoculation for small-pox. In 1713 he was elected, on account of his *Curiosa Americana*, a fellow of the royal society of London, the first American who had received that distinction.

MATHER, INCREASE, an American colonial divine, son of Richard Mather, an English nonconformist minister, who emigrated to Massachusetts in 1635, was b. at Dorchester, Mass., Jan. 21, 1639. He was edueated at Harvard college, Massachusetts, and Trinity college, Dublin, and settled for 62 years as pastor of the North church, Boston. In 1684 he was also chosen president of Harvard college, for which he obtained the right to confer the degrees of B.D. and D.D. An industrious student, he spent 16 hours a day in his study, and published 92 separate works, most of which are now very scarce. One of these, entitled *Remarkable Providences*, was republished in the library of old authors (London, 1856). His influence was so great in the colony that he was sent to England in 1688 to secure a new charter, and had the appointment of all the officers under it. Mather died at Boston, Aug. 23, 1723.

MATHER, RICHARD, D.D., 1596–1697; b. Lowton, Lancashire, Eng.; studied at Oxford in 1618; became parish minister of Toxteth, Lancashire, where he remained 15 years; was suspended in 1634 for non-conformity to the established church; was restored through the influence of friends, but again suspended; removed to New England in 1635; was minister at Dorchester, Mass., 1636–69. Of his six sons, four were distinguished ministers and authors. He was the author of some theological treatises, chiefly on church government, and at the request of the Cambridge synod in 1648 he drew up a form of discipline, which was adopted. His *Journal, Life and Death*, was published for the Dorchester antiquarian and historical society. He was an earnest preacher, and a man of learning. He assisted Eliot in the New England version of the Psalms. He published a discourse on the *Church Covenant;* a treatise on *Justification*, and an elaborate defense of the churches of New England.

MATHER, SAMUEL, 1626–71; b. Toxteth, Eng.; graduated at Harvard college in 1643; preached at Boston, Oxford, and Dublin. At Trinity college, Dublin, he became senior fellow. He is the author of *Old Testament Types Explained and Interpreted.*

MATHER, SAMUEL, D.D., 1706–85; son of Cotton Mather; graduated at Harvard college in 1723; was ordained in 1732, and was pastor of several Congregational churches in Boston. He wrote a *Life of Cotton Mather* in 1729, and also some sermons, pamphlets, and short poems.

MATHEW, Rev. THEOBALD, commonly known as FATHER MATHEW, was descended from an illegitimate branch of the Llandaff family, and was born at Thomastown in Tipperary, Ireland, Oct. 10, 1790. On the death of his father, while Mathew was still very young, the kindness of the Llandaff family enabled the boy to enter the Catholic college of Kilkenny, whence he was transferred, as a candidate for the Roman Catholic priesthood, to the college of Maynooth in 1807. He left that college, however, in the next year. He relinquished the secular priesthood for that of the religious order of the Capuch'ns, in which he took priest's orders in 1814, and was sent to the church of his order in the city of Cork. His singularly charitable and benevolent disposition, his gentleness and affability, his simple and effective eloquence, and the zeal and assiduity with which he discharged all the duties of his ministry, won for him the universal love and respect alike of rich and of poor. To him was due the introduction of the religious, brotherhood of St. Vincent of Paul. He founded schools for children of both sexes, and contributed in a very marked degree to the correction of many abuses and indecencies connected with the burial of the dead, by establishing a new cemetery on the model of that of Père la Chaise, although, of course, of a far less pretentious character. But the great work of father Mathew's life is the marvelous reformation which he effected in the habits of his fellow-countrymen, and which has won for him the title of APOSTLE OF TEMPERANCE. In 1838 he established an association on the principle of total abstinence, at first confined to the city of Cork, but afterwards numbering 150,000 members in the city alone, and extending to the county and the adjacent districts of Limerick and Kerry. The marvelous success which attended this first local effort led to the suggestion that father Mathew himself should repair to the several great centers of population, especially in the south. Thence he gradually extended the field of his labors to Dublin, to the n., and even to Liverpool, Manchester, London, Glasgow, and the other chief seats of the Irish population, even in the new world itself. His success had something almost of the marvelous in its character. The form of engagement partook of the religious,

and was accompanied by the presentation of a medal, to which the utmost reverence was attached by the recipient; and an opinion prevailed among the poor that the mission of the "apostle of temperance" was marked by many miraculous manifestations of the assistance of heaven. It is difficult to form an exact estimate of the number of his association, but it included a large proportion of the adult population of Ireland, without distinction of rank, creed, or sex; and so complete was the revolution in the habits of the Irish people that very many distilleries and breweries ceased from working. Among the sufferers from this great moral revolution the members of father Mathew's own family, who were largely engaged in the distilling trade, were some of the earliest and most severely visited; and it is painful to have to add that the latter years of this great benefactor of his country were embittered by pecuniary embarrassments arising out of the engagements into which he entered in the course of his philanthropic labors. Although very large sums of money passed through his hands, in payment for the medals which were distributed to the members of the association, yet the exceeding munificence of his charities, and the enormous expenses connected with his various missions, and perhaps his own improvident and unworldly habits, involved him in painful difficulties. A pension of £300 was granted to him by the crown in acknowledgment of his eminent public services, and a private subscription was also entered into for the purpose of releasing him from embarrassment. He died in 1856, but the fruit of his labors is still visible in Ireland. Very many, it is true, of those who were enrolled in his association ceased after some years to observe the pledge of total abstinence; but very many also continued faithful; and while but few of those who abandoned the society relapsed into the extreme of drunkenness, the general tone of the public mind in Ireland as regards the use of intoxicating drinks may be truly said to have undergone a complete revolution, which endures to the present day.

MATHEWS, CHARLES, an English comedian, was born on June 28, 1776, and was educated in London. His father was a bookseller, and intended his son to follow the same profession; but his early inclination for the stage overcame parental counsel, and he made his first appearance as an amateur—curiously enough, in the part of Richard III.—at the Richmond theater in 1793, and as a professional comedian in the Theater Royal, Dublin, the following year. He first appeared in London at the Haymarket, and subsequently he transferred his services to Drury Lane. In 1818 he gave his "At Home" in London, and achieved an immense success. He visited America twice. In the autumn of 1828 he became joint proprietor of the Adelphi theater. He died at Plymouth on June 28, 1835, and was buried in that town.

Mathews was a wonderful master of personification and mimicry; and while imitating every one, he never lost a friend, or hurt the feelings of the most sensitive. His taste was as instinctive as his wit. His wonderful variety of facial expression and his gentlemanly sarcasm are still fondly remembered by old playgoers. His son CHARLES also achieved a brilliant reputation in the same department of histrionic art. Born Dec. 26, 1803, he died June 24, 1878.

MATHEWS, CHARLES JAMES, 1803–78; son of Charles Mathews, the comedian; educated as an architect and gave promise of success in that profession, but his natural taste was for the stage, and as a light comedian he soon achieved a high place. He married in 1838 the noted actress and singer, madame Vestris, and in connection with her carried on succesively the Olympic and Lyceum theaters, London. He visited the United States in 1839, 1858, and 1869, and on the second occasion married his second wife, Mrs. Davenport, known on the stage as Lizzie Weston. He played also in Paris and Australia, and everywhere made many warm admirers, not only of his professional talent but also of his personal qualities. He was the author of several plays, perhaps the best of which was *My Wife's Mother*. He also produced several entertainments after the manner of his father's "At Home."

MATHEWS, CORNELIUS, b. N. Y., 1817; educated at the university of the city of New York, and in 1837 called to the bar. Before and after his admission he contributed in verse and prose to various periodicals, such as the *Knickerbocker Magazine*, the *New York Review*, and the *American Monthly Magazine*. He has also contributed to the *Literary World*, and he was for a time an editor of *Arcturus*, a now forgotten monthly magazine. Of his voluminous works we may mention *Behemoth*, a romance, 1839; *The Politicians*, a comedy, 1840; *Witchcraft*, a tragedy, which was produced on the stage in 1846, and subsequently republished in London; and *False Pretenses*, a comedy, 1856. He has worked for many years in behalf of an international copyright, has published a number of addresses on that subject, and organized a copyright club, for whom he drew up an *Address of the Copyright Club to the American People*.

MATHEWS, GEORGE, 1774–1836; b. near Staunton, Va., and admitted to the Georgia bar in 1799; in 1805 was appointed judge of the superior court of the territory of Mississippi, and in 1806 transferred in the same capacity to New Orleans. After the organization of Louisiana as a state he was appointed presiding judge of the supreme court, and filled the post to the time of his death. His decisions form an important part of the judicial history of the state.

MATHIAS, THOMAS JAMES, 1750–1835; b. England; educated at Trinity college, Cambridge, of which he became a fellow. He was appointed treasurer of the household to queen Charlotte, from which office he retired with a pension in 1818. The later part of his life was passed at Naples, and during his long residence in Italy he became thoroughly acquainted with its language and literature. He wrote Italian verses with considerable fluency, but his principal service to Italian literature was his edition of Tiraboschi's standard work, *The History of Italian Poetry*. His first English production, which appeared in 1781, was an imitation from the Norse, called *Runic Odes*. This was followed, two years later, by an *Essay on the Evidence relating to the Poems attributed to Thomas Rowley*. His best work is *The Pursuits of Literature*, which was published anonymously between 1794 and 1797. The chief interest of the *Pursuits* lies in its satirical critical notes, which made a sensation at the time.

MATHIAS CORVINUS, King of Hungary, was the second son of John Hunyady (q.v.), and was b. in 1443. Having been released from the hands of the treacherous Frederick III. of Germany by Podiebrad, king of Bohemia, he returned to Hungary, and was elected king in 1458. His accession was hailed with the utmost enthusiasm over the whole country. But the Hungarian crown at this time was no chaplet of roses; two sovereigns, alike formidable, the one, Mohammed II., from his military talents and immense resources, the other, Frederick III., from his intriguing policy, were busily conspiring against the boy-king. To meet these dangers, Mathias rapidly carried out his measures of defense, the most important of which was the formation of a regular force of cavalry, to form which one man was enrolled out of every 20 families. This was the origin of the term "hussar," which means in Hungarian "the price or due of twenty." Mathias fell on the Turks, who had ravaged the country as far as Temesvar, inflicted upon them a bloody defeat, pursued them as far as Bosnia, took the stronghold Jaieza, where he liberated 10,000 Christian prisoners, and thence returned to Weisenberg, where he was crowned with the sacred crown of St. Stephen in 1464. He next suppressed the disorders of Wallachia and Moldavia; but feeling that his plans were counteracted by the intrigues of Frederick III. to gain possession of Hungary, Mathias besought the assistance of pope Pius II., but to no purpose. After a second successful campaign against the Turks, he turned his attention to the encouragement of arts and letters, and adorned his capital with the works of renowned sculptors, in addition to a library of 50,000 volumes. He sent a large staff of literary men to Italy for the purpose of obtaining copies of valuable manuscripts,* and adorned his court by the presence of the most eminent men of Italy and Germany. He was himself an author of no mean ability, and he possessed a delicate appreciation of the fine arts. At the same time the affairs of government were not neglected. The finances were brought into a flourishing condition, industry and commerce were promoted by wise legislation, and justice was strictly administered to peasant and noble alike. But the promptings of his ambition, and the pressure exercised by the Catholic party, cast an indelible blot on Mathias's otherwise spotless escutcheon; he wantonly attacked Podiebrad, his father-in-law, the Hussite king of Bohemia, and after a bloody contest of seven years' duration between these kings, the greatest generals of the age, the Hungarian power prevailed, and Moravia, Silesia, and Lusatia were wrested from Bohemia. Immediately after the conclusion of this war Mathias went to meet his old enemies, the Turks, and inflicted upon them, at Kenyérmezö (1479), such a defeat as kept them quiet for the next 46 years. After defeating an invading army of Poles, he had at length a fair opportunity for settling his differences with Frederick, and taking revenge on the insidious plotter who had imbittered his whole life. The Austrian fortresses fell before him in rapid succession. After an obstinate defense, Vienna shared the same fate (1485), and the emperor was reduced to beg his bread from village to village. Mathias now took up his residence in Vienna, but while on the pinnacle of glory he was struck down by a fit of apoplexy, and died at Vienna in 1490. To the patriotism and bravery of his father, Mathias added a taste for letters, and the highest abilities as an administrator and politician; even his secret enemy, Castelli, testifies "that for subtlety and daring he had no equal among the princes of the age.

MATHILDA, Countess of Tuscany, well known in history through her close political connection with pope Gregory VII., was a daughter of Boniface, count of Tuscany, and was born in 1046. She is said to have married Godfrey (surnamed *Il Gobbo*, or the "Hunchback"), duke of Lorraine, in 1069, by procuration; but if so, her husband did not make his appearance in Italy until 4 years after the wedding-ceremony, and the two, if they were ever united, soon afterwards separated. Godfrey went back to his duchy, and became a supporter of the emperor Henry IV., while Mathilda made herself conspicuous by the zeal with which she espoused the cause of Gregory VII. She became his inseparable associate, was ever ready to assist him in all he undertook, and to share every danger from which she could not protect him. In 1077 or 1079 she made a gift of all her goods and possessions to the church. In 1081 she alone stood by the pope, when Henry poured his troops into Italy, burning to avenge his humiliation at Canossa; she supported him with money when he was besieged in Rome; and after his death at

* Even at the present day the remains of the celebrated *Collectio Corvina* are eagerly sought after.

Salerno, boldly carried on the war against the emperor. She died at the Benedictine monastery of Polirone in 1115. Mathilda's death gave rise to new feuds between the emperor and pope Paschal III., on account of her gift to the church, which finally resulted in the former wresting from the latter a portion of Mathilda's possessions, but even what remained constituted nearly the whole of the subsequent "Patrimony of Peter."

MA'TICO, *Artanthe elongata*, a shrub of the natural order *piperaceæ*, a native of Peru, remarkable for the styptic property of its leaves, which are used for stanching wounds, and are also useful as an aromatic stimulant in mucous discharges.

MATIN DOG, a large kind of dog, now almost peculiarly French; but supposed to have been introduced into France from the n. of Europe. It is allied to the Danish dog. It has rough hair; a rather flat forehead; a rather pointed muzzle; the ears erect, but bent down at the tips. It is generally of a whitish color, clouded with brown. It is fierce, but not very courageous. Buffon, without reason, imagined it to be the original of many kinds of dog.

MATINS. See CANONICAL HOURS.

MATRICA'RIA. See CHAMOMILE.

MAT'SUMAI, a t. and port of Japan, and the largest center of commerce and population in the island of Yesso. It is on the s. coast, about 60 m. w. of Hakodadi, and contains, it is said, 60,000 inhabitants. It extends along the margin of an open bay, facing which is an island with a beacon, sheltering a harbor capable of receiving the largest ships.

MATSYS, or MESSYS, QUENTIN, 1460–1530; b. in Louvain; bred a blacksmith, early enamored with a painter's daughter, and led to become a painter. His subjects are principally religious, marked by a hard treatment in outline, but great force of expression. His "Descent from the Cross," in the Antwerp museum, was praised by sir Joshua Reynolds for heads scarcely exceeded by those of Raphael. "The Misers," which has been made familiar by engravings, is one of his noted works, which are to be found in nearly every great gallery in Europe.

MAT'TAWA, the proposed e. terminus of the Canadian Pacific railway, at the junction of the Ottawa and Mattawa rivers, in Nipissing district, Ontario, 189 m. above Ottawa. The Hudson's Bay company had a trading-fort at this point.

MATTEAWAN', a village in the t. of Fishkill, Dutchess co., N. Y., situated on the Dutchess and Columbia railroad and on Fishkill creek, 1½ m. from the Hudson, at Fishkili Landing; pop. about 2,000. It has manufactures of felt goods, hats, files, lawn-mowers, wood-working machinery, etc.; also four churches, a newspaper, and good schools.

MATTER. From a physical point of view, matter is anything that can affect the senses, or that can exert, or be acted on by, force. The existence of matter, in the sense of *substance*, has been doubted by many philosophers, including some of the greatest of experimenters. Indeed, as we can know matter only by the forces it exerts, it is obvious that the supposition of mere geometric points, capable of exerting force (technically called *centers of force*), will as satisfactorily account for all observed phenomena as any other idea of the ultimate nature of matter. Here, however, we are dealing with a question confessedly beyond the reach of experiment, and belonging to the domain with which metaphysics professes to deal. See PERCEPTION.

Although experiment cannot lead to a knowledge of the ultimate nature of matter, it may lead to important discoveries as to the arrangement of the molecules of different bodies, and their similarity or dissimilarity. Some of the questions to which we may expect an answer, though not a speedy one, have already been mentioned in the article FORCE, CONSERVATION OF; but in order to render intelligible the short account which we intend to give of some very interesting ideas recently propounded by Graham (q.v.), it will be necessary to repeat some of them.

The old idea of the transmutation of metals (see ALCHEMY) implicitly contains the assumption that all kinds of matter are ultimately one. Far from being a startling assumption, this is the simplest and most easily conceived notion we can entertain on the subject; and it offers a remarkably simple explanation of that extraordinary property of matter which Newton proved by careful experiments, that the weight of a body depends only on the quantity, not on the quality of the matter that composes it. One idea, then, of matter is, that the atoms (or smallest parts, whatever these may be) of all bodies are identical, but that the molecules (each of which is a single atom, or a definitely arranged group of atoms) differ from one body to another. Thus (to take an instance merely for *explanation*, not as at all likely to be correct), if hydrogen be supposed to consist of the simple atoms of matter; oxygen, each molecule of which is 8 times as heavy as one of hydrogen, may have each molecule formed of 8 elementary atoms, arranged in a group such as the corners of a die; carbon, 6 times as heavy per molecule, might be composed of 6 simple atoms grouped as at the corners of an octohedron; and so on. It is obvious that here each atom must be supposed capable of exerting force on every other. This leads us naturally to speculations as to the medium

through which this force, if it be exerted at a distance, is propagated (see FORCE, CONSERVATION OF); and then we have introduced matter of a more refined character than our supposed elementary atoms. This difficulty has suggested to various philosophers the idea that there is no *actio in distans*, that all pressure, for instance, in a gas is due to incessant impacts of its particles upon each other and upon the containing vessel. But from various experimental results, we know that *this* species of motion is capable of being transferred from one body to another, of being increased or diminished by change of temperature, and is, in fact, *heat* itself, one form of kinetic energy. This, if there be no ultimate difference between kinds of matter, could never be the cause of their apparent difference. Hence, in Graham's view, though all ultimate atoms are identical in substance, they have special motions of their own, by which one is distinguished from another. these motions not being capable of transfer from one atom or group of atoms to another. It is difficult to conceive energy in such a form as not to be transferable, so that we refer the reader to Graham's own papers for the further development of his theory—remarking, in conclusion, that no theory of the nature of matter can be considered as at all complete till it account for the mutual action of separate atoms; for this the existence of a *continuous* material medium in space would seem to be necessary; and this, in its turn, would, if accepted, enable us to dispense with the idea of atoms. In connection with this, we may mention that sir William Thomson has shown that more heterogeneity (which we know exists in matter), together with gravitation, is sufficient to explain all the apparently discordant laws of molecular action; matter being supposed, in this theory, to be continuous but of varying density from point to point.

MATTER (*ante*). See ATOM; ATOMIC THEORY, *ante*.

MATTER, JACQUES, 1791 1864· b. in Alsace, educated at Strasburg, Göttingen, and Paris; prof. of history and director of the college of Strasburg in 1820; in 1832, Guizot made him inspector general of studies, and of libraries in France, and counselor of the university. He was a lecturer on ecclesiastical history, a Protestant, and the author of a great number of standard works, among which are, *Histoire universelle de l'Église cretienne*, 1839; *De l'influence des moeurs sur les lois et de l'influence des lois sur les moeurs*, 1843; *Histoire des doctrines morales et politiques des trois derniers siecles*, 1837, *de l'état moral, politique, et literaire de l'Allemagne*, 1847; *Philosophy de la religion*, 1857. His treatise on the influence of manners upon law, etc., drew from the academy a special prize of 10,000 francs.

MATTERHORN (Fr. Mont Cervin; Italian, Monte Silvio), the grandest mountain mass of the Alps, located near Zermatt in Switzerland between the Canton Valais, and the Val d'Aosta in Italy. Its height is 14,805 ft., but that fact alone gives little idea of the sublimity of its abrupt rise above the great range of which it is the sentinel peak. The vast glaciers around it have their upper sources in snows at the foot of this mighty crag, which rises on its northerly face in a sheer precipice nearly 4,000 ft. above them. Seen from the pass of St. Theodule or Mont Cervin it takes the form of a craggy cone, apparently inaccessible. From the Italian side one sees its neck or comb connecting it with the rest of the range; and this side forms the only suggestion of an approach to its summit. Previous to 1858 it was deemed impossible of ascent. The professional guides of the Alps held it in awe. But English enthusiasts in mountain climbing had long looked upon its defiant steeps with longing eyes. During the summers of 1858–59 two well-organized parties attempted it and could get no further than about 2,200 ft. below its summit. In July, 1860, three young Englishmen of the name of Parker, without a guide, succeeded in mounting to the height of 12,000 feet. Prof. Tyndall in 1860–61, seems to have been possessed with a fever of desire to tread its summit; and made a series of determined attempts, in one of which he had a marvelous escape from death in an avalanche. In spite of his courage and skillful use of means he was baffled, after reaching a point 500 ft. higher than had been reached before. In July, 1862, he made a third attempt and reached the height of 13,970 ft.; but accident and the elements were against him, and again he was disappointed. It was reserved for a London engraver, August Edward Whymper, who had recently gained his first experience of mountain climbing in the French Alps, to make the first ascent to the summit: after two carefully planned but unsuccessful efforts in the summers of 1863–64, he, with a party of friends succeeded, July 15, 1865, in reaching the summit. But it ended in a fearful tragedy. Lord Francis Douglass, the Rev. Charles Hudson, Mr. Hadow, and four guides made up the party; starting from Zermatt on the 14th. While descending in fine spirits a miss-step by one of the party caused the fall of a guide, and the breaking of their connecting rope; when the three gentlemen named, and one of the best guides were hurled down the vertical face of the mountain upwards of 3,000 feet. Three days later the summit was reached from the Italian side by Jean Antoine Carrel, a professional Swiss guide, with others. Mr. Crawford Grove and party reached it in 1867. Mr. Elliot and two guides in 1868 ascended it from the north side. Prof. Tyndall ascended it about the same time from the south side, passed over its crest, and descended on the north. Its ascent is now made less perilous by a hut built at a height of 12,526 ft., and by the familiarity of guides with the most dangerous points, and the means to surmount them. Tyndall's *Hours of Exercise in the Alps* gives a vivid description of his attempts to ascend the Matterhorn in 1860–61. Whymper's *Scrambles Amongst the Alps* published in 1871 is,

however, the most remarkable book of mountain climbing ever published; and besides being devoted largely to the attempts to scale the Matterhorn, is profusely illustrated with drawings sketched and engraved by himself.

MATTEUCCI, CARLO, 1811-68; b. at Forli, Romagna, Italy; of a middle-class family; educated in the university of Bologne, and doctor of mathematics in 1829. From 1831 he devoted himself to the study of electricity and chemistry, became a friend and co-laborer of Arago, and through the influence of Humboldt was made professor of physics in the university of Pisa. He became the inventor of means of applying electric currents to the human body, and one of the most advanced investigators of the physiological effects of electricity. Among his works are: *Essai sur les phénomènes électro-physiologique des animaux*, 1840; *Traité des phénomènes électro-physiologique des animaux*, 1844. His essays in the "Philosophical Transactions" of London and in the scientific reviews of Paris, Geneva, and Italy were of high value. As a politician also his career was distinguished. As commissary under Charles Albert he sought first to avert, and then to ameliorate, the Austrian rule in Italy after the suppression of the revolution of 1848; was senator of the Tuscan assembly in 1848; commissioner to Paris on the annexation of Piedmont in 1859; member of the Italian senate in 1860; and bearer of the commission of the congress of Italy to make Victor Emmanuel king of Italy. In 1862 he had the revision of the public system of education for Italy, under the Rattazzi administration; and in 1864 published a valuable work on national instruction entitled *Lettres sur l'instruction publique*.

MATTHEW, SAINT, an apostle and evangelist, was a publican or tax-gatherer at the sea of Galilee. It is assumed by divines generally that he is the same person that Mark and Luke refer to under the name of "Levi;" but several weighty names are against this view, as, for example, Origen, Grotius, Michaelis, and Ewald. After the ascension of Christ, Matthew is found at Jerusalem; he then disappears from Scripture. Nothing whatever is known of his career.—Matthew's gospel is believed to be the first in point of time. Irenæus places its composition in the year 61 A.D.; some of the later fathers, as early as 41 A.D. The obvious design of the work is to prove the Messiahship of Jesus; hence the frequency of the expression used in regard to the acts of the Saviur, "that it might be fulfilled which was spoken by the prophet." Much controversy has been carried on regarding the language in which St. Matthew wrote his gospel. The opinion of the ancient church generally (founded on a passage in Papias, bishop of Hierapolis in the 2d c.) was that Matthew wrote it in Hebrew, or rather in that mixture of Hebrew, Chaldee, and Syriac spoken in Palestine in Christ's time, and known as Aramaic. Erasmus doubted this, and held that Matthew only wrote the one we now possess. His view was supported by Calvin, Beza, and others of the reformers; and more recently, in some form or other, by the great majority of scholars, both orthodox and heterodox. Still more recently the opinion of Bengel, that Matthew wrote first a Hebrew gospel and then translated it into Greek, has been advocated by several able writers. The passage in Papias is by no means clear, and some of the greatest grammarians and biblicists, such as Lachmann, Ewald, Meyer, Reuss, and Credner, understand it to mean that Matthew only drew up a series of notices of Christ's life and sermons, which were afterwards arranged in some sort of order by another writer. Even yet, however, the order is but dimly perceptible, and little or no attention is paid to chronological sequence. On this view the present gospel is Matthew's in substance only, and not in form. The style is comparatively tame, and even the conception of Christ, which is predominant, is earthly rather than divine. Hence the fathers called it the *Somatic*, or "bodily" gospel, as distinguished from the more spiritual gospels of Luke and John.

MATTHEW, THE EVANGELIST, is regarded by most of the ancient Christian writers, and by the best modern commentators, as identical with the publican whom Mark and Luke name Levi. If their view be correct, Matthew—signifying in Hebrew "the gift of Jehovah"—was perhaps a surname analogous to Peter as added to Simon, and to Boanerges as applied to James and John. He was early called to be a disciple, and was afterwards numbered among the twelve apostles. He was a publican, probably one of the subordinate class who were charged with collecting the taxes in a limited district. Having left all to follow Jesus, he also made him a feast in his house, at which a great multitude of publicans were present as invited guests. After the record of his choice as one of the apostles, given by three evangelists—of whom only Matthew speaks of himself as the publican—no mention is made of him in the gospels, except generally as they all speak frequently of "the twelve," and, after the departure of Judas, of "the eleven;" and in the Acts, having been mentioned once by name, he is included afterwards among "the eleven," and probably also among "the apostles." A tradition, as old as the 1st c., says that he continued in Jerusalem about 15 years after the ascension. With this accords the statement of Eusebius, made long afterwards, that he preached to his own nation before he went to foreign countries. Among the countries mentioned by other writers are Ethiopia, Persia, Macedonia, Media, and Parthia. Several of the earlier writers agree in numbering him among the few apostles who did not suffer martyrdom, though a later tradition affirms that he, too, sealed his testimony with his blood.

MATTHEW OF WESTMINSTER, an early English chronicler, who flourished in the reign of Edward II., but of whom nothing whatever is known except that he was a monk of the Benedictine abbey of Westminster. His history or chronicle is written in Latin, and is entitled *Flores Historiarum, per Matthæum Wesmonasteriensem collecti, præcipue de Rebus Brittannicis, ab Exordio Mundi, usque ad annum* 1307 (Flowers of history gathered by Matthew of Westminster, chiefly concerning the affairs of Britain, from the Beginning of the World down to the year 1307). That part which treats of English history from the conquest to the close of Edward I.'s reign is considered valuable, on account of the manifest diligence, accuracy, and honesty of the writer. The work was first printed at London in 1567, and again (with additions) at Frankfort in 1601. Bohn has published a translation into English (2 vols., 1853).

MATTHEW, GOSPEL OF, placed first in all arrangements of the four gospels, and also probably one of the first written, was from the beginning acknowledged and widely diffused as one of the canonical books of the New Testament. From Papias, who closely followed the apostles, there is continuous chain of trustworthy witnesses that Matthew the apostle wrote a gospel, and the abundant quotations in the fathers, down to Irenæus and Justin Martyr, prove that the gospel then received as his was the same as that which we have. These early witnesses agree also in saying that Matthew wrote his gospel with primary reference to the Jewish Christians of Palestine, and their statement is confirmed by internal evidence. One great object of the author plainly was to exhibit Jesus of Nazareth as the Messiah whom the types of the Old Testament prefigured and its prophets foretold. This the opening sentence of his gospel shows, declaring Jesus Christ to be the son of David and of Abraham, and this the advancing chapters, recording events as "realized prophecy," keep constantly in mind. Still no evangelist exhibits more clearly also the ultimately universal diffusion of the gospel message through the world. Even the beginning of the ministry of Jesus, as Matthew records it, gave light not only to Jews, but also to Galilee of the Gentiles; and, at the close, the first gospel gives, equally with the second and third, the universal command, "Go ye and make disciples of all nations." The general testimony of the early writers is that Matthew wrote his gospel in Aramaic; that is, in the dialect of the Hebrew which was then spoken in Palestine. Yet, while all the fathers of the church assert the Hebrew origin of the gospel, as Olshausen remarks, "They, without exception, make use of the existing Greek text as canonical Scripture, and that without doubt or question, or anything that would lead to the belief that they regarded it as of less authority than the original Hebrew, or possessed it in any other form than that which we now have." And if the Hebrew gospel had ever been clothed with supreme authority as the only one written by Matthew, a Greek translation could not have been substituted for it without opposition, or without leaving some traces of the process by which it had been done. But nothing of the sort occurred. The Greek text itself also, according to the judgment of careful critics, presents no marks of being a translation, but many of being an original work. The correspondence of the Greek text with the Greek of Mark and of Luke points also to a Greek original. All the ancient versions also, even the Peshito Syraic—the very language which corresponds with the Aramaic—were taken from the present Greek text. The summing up of the testimony, therefore, favors two originals, both from Matthew, both used at first as occasion required, and the Greek, diffused abroad much more widely, finally remaining alone in circulation and use. That a full account of the life of Jesus should be needed at first among the Jews, in both Hebrew and Greek, is illustrated by Pilate's action in writing above the cross, in three languages, the single declaration, "This is Jesus, the king of the Jews, and by the apostle John's record that one reason why many of the Jews read the title was that it was written in Hebrew, Greek, and Latin.

The contents of the gospel may be divided into eleven sections: I.—The ministry of Jesus: Chapters i.-iv. containing his genealogy, coming down from Abraham, and his birth at Bethlehem; the visit of the wise men, the flight into Egypt and the return; the ministry of John, the baptism of Jesus, followed by the descent of the Spirit and the voice from heaven; the temptation of Jesus, the beginning of his ministry, the calling of his first four disciples, and his first circuit in Galilee, accompanied with an outburst of power over all kinds of disease. II.—The new law given in the sermon on the mount, v.-vii.: The beatitudes; his disciples compared to the salt of the earth and the light of the world; the law and the prophets to be fulfilled; new expositions of various commandments; directions for alms-giving, for prayer—of which a model is given in "the Lord's Prayer"—and for fasting; counsels against laying up earthly treasures, and against anxious thought; command not to judge others or to mark their faults; counsel not to cast pearls before swine; promise that prayer shall be answered; the "golden rule" given; exhortation to enter the strait gate and narrow way; warning against false prophets and false professors; the emblem of houses built on the rock and on the sand. III.—Record of events exhibiting Jesus as a doer of mighty works, viii., ix.: The leper cleansed; the centurion's servant healed; Peter's mother-in-law cured; multitudes of sick persons healed and many demons cast out; the storm on the lake calmed; the legion of demons cast out of the man and allowed to enter the swine; the man sick of the palsy forgiven and healed; Matthew called and publicans and sinners received; the woman

that touched his garment healed, and the ruler's daughter raised; the two blind men restored and the dumb demon cast out; the second circuit of Galilee and the general cure of sickness and disease. IV.—The choice of the twelve apostles, x.: Their names given and the varied instructions to them recorded. V.—Doubts expressed and opposition exhibited, xi., xii.: The inquiry sent by John from the prison, the answer returned, the testimony of Jesus concerning him; the unrepenting cities condemned; thanksgiving to the Father· invitation to the weary; authority claimed over the Sabbath, the withered hand healed, the Pharisees silenced, and their council against him; his withdrawal, followed by the healing of great multitudes; a demon, blind and dumb, cast out; the opposition of the Pharisees and their consequent condemnation. VI.—Parables relating to the kingdom of heaven, xiii.: 1–52: Of the sower; the tares among the wheat; the mustard seed; the leaven; the treasure hid in the field; the pearl of great price; and the net cast into the sea. VII.—Effects of the ministry of Jesus on various classes of people, xiii.: 53—xvi.: 12: On the inhabitants of Nazareth; on Herod, explained by his treatment of John the Baptist; on the men of Gennesaret; the multitudes whom he feeds; the Pharisees and Scribes; the woman of Canaan. VIII.—Revelation concerning his divine nature and his sufferings, with instructions to the disciples, xvi.: 13—xviii.: Simon Peter's confession of faith in him; his sufferings foretold; his transfiguration, followed by the casting out of a demon from a child; the temple-tax paid; instructions concerning humility, illustrated by a child, and concerning forgiveness, enforced by the parable of the debtors. IX.—Events during the journey from Galilee to Jerusalem, xix.–xxiii.: Law concerning divorce; benediction on little children; answer to the inquiry concerning the attainment of eternal life, and rewards promised to the disciples; parables concerning the laborers in the vineyard; his sufferings again foretold; the ambitious request of James and John; two blind men restored to sight; the entrance into Jerusalem; the cleansing of the temple; the hosannas of the children; the fig-tree withered; the chief priests and elders silenced; the parables of the two sons and the vineyard, of the husbandmen and the vineyard, and of the marriage of the king's son; the hypocritical question of the Pharisees, the scoffing question of the Sadducees, the earnest question of the lawyer, and the silencing question of Jesus; woes pronounced on the Pharisees and on Jerusalem. X.—Last discourses, xxiv., xxv.· The destruction of the temple foretold to be attended and followed by wars, tribulations, false Christs and prophets, and, at some unknown time, by the coming of the Son of Man; the suddenness of his coming compared to the flood and enforced by the parables of the servant and his lord, of the virgins and their lamps, of the talents, and of the shepherd dividing the sheep from the goats. XI.—The crucifixion, burial, resurrection, and final commission to the disciples.

MATTHEW PARIS, or MATTHEW OF PARIS. See PARIS, MATTHEW, *ante*.

MATTHEWS, a co. in e. central Virginia; pop., '80, 7,501—2,424 colored. The form of the co. is that of a peninsula, the Chesapeake bay lying on the e., Mobjack bay on the s., and Piankatank river on the n. and n.west. The soil is naturally sandy and the staples are Indian corn and pork. There is some manufacturing and fishing. Chief town, Matthews Court House.

MATTHEWS, GEORGE, 1739–1812; b. in Augusta co., Va.; served with great distinction in the revolutionary war; received nine wounds in the battle of Germantown and was taken prisoner. In 1785 he removed to Oglethorpe co., Ga., and was governor of that state 1793–96; member of congress 1789–91; engaged in military operations in Florida in 1811, with the rank of brig.gen. of militia.

MATTHEWS, JOHN, 1744–1802; b. S. C.; distinguished for patriotism during the revolutionary war; speaker at one time of the South Carolina house of representatives; associate justice of the supreme court in 1776; member of congress in 1778–82; governor of South Carolina in 1782–83; and in 1784 a judge of the court of equity. Died at Charleston.

MATTHIAS, SAINT, one of the 70 disciples, chosen an apostle by lot to fill the place vacated by the treachery and suicide of Judas. Of his origin, family, history, the scene of his labors, the date and place of his death, nothing is known, nor is there any tradition on which reliance can be placed.

MATTHIAS, Emperor of Germany, 1557–1619; son of Maximilian II., and grandson of Charles V. His eldest brother, Rudolf II., had succeeded to the throne upon the death of their father. Rudolf resented the influence exerted by Matthias in the affairs of the German empire, and the latter, to strengthen himself in another quarter, became the champion of the Netherlands, in whose affairs he exercised a great authority till 1580, when he was compelled to give way to the ascendancy of the prince of Orange. Upon the death, in 1595, of his brother Ernest, archduke of Austria, he governed the archduchy, where the principal feature of his administration was his persecution of the Protestants. In 1606 he restored order in Hungary, which had formed a coalition with Turkey and Transylvania against the Hapsburgs. Two years later, with the aid of a league which he had formed between Hungary, Silesia, and Moravia, he forced upon Rudolf the cession of Austria, Hungary, and Moravia, and at the same time, was guaranteed the succession to the Bohemian crown. Matthias afterwards allied himself with the Bohemians who were then in revolt, and compelled Rudolf to cede him Silesia and

Lusatia, in addition to Bohemia. Rudolf died without issue in 1612, and Matthias was at once chosen his successor. The Turks had invaded Hungary, and Matthias, who was able to offer them no substantial resistance, was compelled to sue for peace. In the later days of his Austrian administration, he had made overtures to the Protestants, whom he had formerly persecuted; and he had encouraged the Jesuits. He soon found himself in conflict with both. A Protestant league had been established in 1608, of which the count palatine Frederic IV. was chief; and a counter Roman Catholic league had been organized in 1609. Matthias attempted to bring the latter, which was then under Bavarian management, under Austrian influence; and failing in this, framed a decree against both the Roman Catholic and Protestant leagues. The decree failed of its effect, neither league paying any attention to it. The administration of Matthias had proved a failure, and he made of his ill health an excuse for withdrawing from public affairs. In 1617 he made the archduke Ferdinand, afterward the emperor Ferdinand II., king of Bohemia; and the next year, substituted him for himself, on the throne of Hungary. The Bohemians revolted against Ferdinand, enraged by the severity of his religious persecutions; the insurrection at Prague, in 1618, gave the signal for the outbreak of the thirty years' war, and the last days of Matthias were embittered, not only by his own failure, but by the reverses which the Bohemians inflicted upon Ferdinand.

MATTHIAS I., THE GREAT. See MATTHIAS CORVINUS, *ante*.

MATTHIAS, b. Washington co., N. Y., in 1790; a religious fanatic and impostor. His real name was ROBERT MATTHEWS. He kept a country store, and having failed in 1816, removed to New York. In 1827 he resided in Albany, and became much excited by the preaching of the Rev. Drs. Kirk and Finney. He was very earnest in the temperance cause, claimed to have received a divine revelation, and commenced street preaching, endeavoring to convert the city of Albany. His preaching being unsuccessful, he predicted the destruction of the city, and went secretly to New York where he deluded several respectable people. Being accused of poisoning one of his wealthy disciples in whose family he lived, he was tried and acquitted. After the exposure of his impostures he left and is said to have died in Arkansas. W. L. Stone of New York published *Matthias and his Imposture*.

MATTHIAS, OR MATTHIESEN, JOHN. See ANABAPTISTS, *ante*.

MATTHISSON, FREDERIC VON, 1761-1831; b. Germany; educated at the school in Klosterbergen, and studied theology at Halle. He had been educated by his grandfather, a Protestant minister, with a view to entering the church, but his fondness for literature led him to give up his design of taking orders, and he took private pupils at Heidelberg and Mannheim. After passing two years near lake Geneva, where he enjoyed the society of the philosopher Bonstetten, he became private tutor to the son of a merchant in Lyons. He returned to Germany in 1792, and two years later was appointed reader to the princess of Anhalt. He accompanied her in her travels through Switzerland, the Tyrol, and Italy, and upon her death in 1812 was taken into favor by the king of Würtemberg. Attached to the suite of the duke of Würtemberg, he revisited Italy in 1819, and resided for some time at Florence. He is one of the most popular of the German lyric poets, and as a prose writer holds a respectable rank. His complete works including his earlier *Schriften und Erinnerungen* were published at Zurich, 1825–29. His verse is smooth and melodious, dwelling with predilection on pictures of rural life, and animated by a gentle fancy. One of the best of his lyrical pieces, his *Adelaide*, was set to music by Beethoven. Besides his original work, he made a selection from the lyrical German poets, which was published at Zurich in 20 vols., 1803–7. His posthumous works were collected and published in 1832.

MATTISON, HIRAM, D.D., a distinguished divine of the Methodist Episcopal church; 1811–68; b. Norway, Herkimer co. N. Y. The first years of his early manhood were spent in teaching, but at the age of twenty-three his mind turned to the ministry, and in 1836 he entered the Black River conference; was stationed at Watertown and Rome; in 1850 and 1852 was made secretary of the conference; removed in 1852 for his health to New York; was pastor of John street church, and afterwards of Trinity M. E. church in 34th street, which he organized. He labored with great earnestness to persuade the general conference in 1860 to take action against all slaveholding in the church; but failing in this he withdrew from the Methodist Episcopal church, Nov. 1, 1861, and became pastor in St. John's Independent Methodist church. He returned in 1865 to the denomination that he had left, and was appointed to Trinity M. E. church in Jersey City, where he died. The last year of his life he was cor. secretary of the American and Foreign Christian union. Dr. Mattison was an eloquent preacher. He wrote with great rapidity, and his works were numerous. The following are some of the most prominent of his published works: *A Scriptural Defense of the Doctrine of the Trinity; Tracts for the Times; Elementary Astronomy, accompanied with Maps;* in 1850 an improved edition of *Burritt's Geography of the Heavens; High School Astronomy; Spirit-rapping unveiled; The Wesleyan Doctrine of Perfection; Sacred Melodies; Minister's Pocket Manual; Impending Crisis; Immortality of the Soul and Resurrection of the Body; Select Lessons from the Holy Scriptures; Defense of American Methodism; Popular Amusements.* He left an unfinished treatise on *Depravity in its Relation to Entire Sanctification;* and the outlines of other

theological works. His contributions to the periodical press were numerous and valuable. He was the author of several poems of merit.

MAT'TO or **MATO GROS'SO** (*dense forest*), a province of Brazil, bordering on Bolivia. Area 550,000 sq.m.; population estimated at 100,000, mostly Indians. Chief rivers, the Madeira, Juruema, and Paraguay, with their numerous affluents. Its soil is fertile, but there is almost no cultivation. Dense forests cover immense tracts of the country. Gold and diamonds abound, and indeed the mineral riches of the province have hitherto formed the chief barrier to its progress. Diamonds, gold, hides, balsams, ipecacuanha, and other drugs, are the exports. Manufactured goods are imported.

MATTOON, EBENEZER, 1755–1843; b. Amherst, Mass., and graduated at Dartmouth in 1776; joined the revolutionary army, served as lieut. of artillery in the battle of Bemis Heights in 1777, and was promoted to the rank of major. After the war he settled in his native town as a farmer; was often elected to the legislature, and for 20 years served as sheriff of Hampshire co.; member of congress in 1801–3; maj.gen. of state militia from 1797 to 1816, and adj.gen. in the latter year; col. of the ancient and honorable artillery company of Boston in 1817, and member of the Massachusetts constitutional convention of 1820. During nearly 25 of the last years of his life he was blind.

MATURIN, CHARLES ROBERT, 1782–1824; b. Dublin, Ireland; educated at Trinity college. He took orders in the Anglican church, became curate of St. Peters, and as a preacher is said to have been eloquent and impressive, but is chiefly known as a romancist and dramatic writer. His most noted novels are *Fatal Revenge*, (1807); *Milesian Chief; Women, or Pour et Contre;* and *Melmoth, the Wanderer*. All and especially the last named are of that lurid and sensational style, blending the supernatural and the horrible, to which the works of Mrs. Radcliffe and Monk Lewis had accustomed the public in the early part of the century. That Maturin was possessed of genius cannot be denied; but it was for the most part misdirected, and, of the elements now considered requisite among first-class writers of fiction, vigor and a vivid imagination were the only traits to be found in his work. As a dramatist his only successful production was *Bertram*, a wild and uneven tragedy marked by most of the characteristics of the novels. This was produced in 1816 under the patronage of Scott and Byron, and met with brilliant success, the author clearing £1000. In his later years, like too many of his contemporaries, Maturin was in continual financial embarrassment.

MAUBEUGE, a fortified t. in the n. of France upon the river Sambre; pop. about 14,000. It has manufactures of iron bars, hardware, marble, beer, and linen thread; and commerce in slates, oils, marble, and iron. The town was founded in the year 650. It has been by turns under the rule of Spain, Germany, England, and France; was captured and burned in 1477 by Louis XI.; in 1543 by the son of Francis I., in the war with Charles V., and again burned; in 1553 by Henry II., and again burned. In 1637 it was subject to the governor of the Low Countries; in 1680 Louis XIV. caused it to be refortified; in 1815 it fell into the hands of the allies, and was held by Russia till 1818.

MAUCH CHUNK, a borough of Pennsylvania, capital of Carbon co.; situated on the Lehigh river, at the point where it passes through the Mahoning mountain; pop. of township, '70, 5,210; of borough, 3,841. It is on the Lehigh Valley railroad, the New Jersey Central railroad, and the Lehigh canal; is distant from Philadelphia 89 m.; from New York, 121 miles. This point forms the eastern extremity of the southern anthracite coal region of Pennsylvania, while its situation and surroundings are picturesque and romantic in the extreme, and cause it to be very generally visited as a summer resort by tourists in search of striking natural scenery. Nine m. west of the village are the Summit Hill coal mines, which are celebrated as among the most productive in the state. The coal was formerly carried thence by means of a gravity railroad, called the "Switchback," to Mauch Chunk, the cars returning by a similar road to the mines; this road is now used for tourists and excursions, and the coal is transported through a tunnel. The borough is extensively built up with fine residences, and contains several public institutions, churches, and schools. Mount Pisgah, and mount Jefferson, ascended by the road already mentioned, are points for the attention of excursionists, from which can be gained a magnificent view of the Lehigh valley and the surrounding scenery. Summit Hill offers a special attraction in a burning mine which has been on fire since 1832. Glen Onoko is another and more fascinating place of resort, two miles from the village.

MAUCHLINE, a t. in the co. of Ayr, Scotland, is pleasantly situated, and is surrounded by a picturesque country. Mauchline has long been noted for the making of a beautiful description of snuff-boxes, cigar-cases, and other articles of that kind of manufacture. The buildings of the town are neat, and possess a pleasing variety. Standing, as Mauchline does, on the river Ayr, the bridges in the neighborhood attract attention, one of which, at Barskimming, is a structure of considerable elegance, consisting of a single arch 100 ft. wide and 90 ft. high. In the vicinity is Mauchline castle, formerly possessed by the Loudon family, who had a right to the title viscount Mauchline; there is also the green on which a stone commemorates the death of five Covenanters in 1685. Robert Burns spent nine years of his life at the farm of Mossgiel, about half a mile to the n. of Mauchline. The cottage of "Poosie Nancy," theater of the "Jolly Beg-

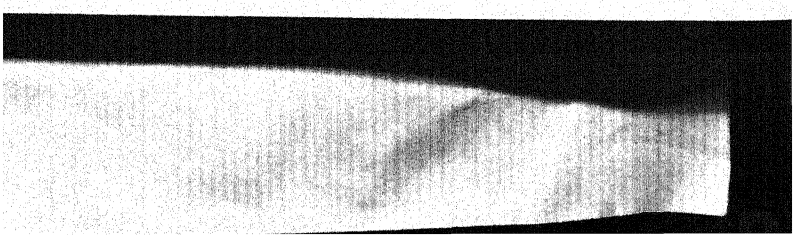
gars," and Mauchline Kirk, the scene of the "Holy Fair," are in the town. The population in 1871 was 1574.

MAUDSLEY, HENRY; b. England, 1835; educated at University college, London, where he took a course of medical study. He received the degree of M.D. from the university of London, in 1857, and soon after became physician to the Manchester royal lunatic hospital, where he remained till 1862. He was elected a fellow of the royal college of physicians and surgeons in 1869, to which he became Gulstonian lecturer in 1870. Dr. Maudsley is editor of the *Journal of Mental Science*, and has made a specialty of the study of lunacy, and mental diseases. He has published *The Physiology and Pathology of Mind; Body and Mind; Responsibility in Mental Disease*. He is now professor of medical jurisprudence in University college, London, and consulting physician to the West London hospital.

MAUDUIT, ISRAEL, 1708–87; b. Exeter, England; educated for a dissenting minister, but never entered the profession; went into mercantile business with a brother and accumulated a fortune, and in 1763 was appointed to represent the interests of the province of Massachusetts, of which his brother Jasper was the nominal agent. He was made collector of Southampton in 1765; espoused the cause of the colonies in the discussions preceding the revolution, writing several pamphlets upon the subject; at a later day defended with his pen the cause of American independence, calling lord Howe and sir William Howe to severe account.

MAUDUIT DUPLESSIS, THOMAS ANTOINE, Chevalier de, 1753–91; b. France. He joined Rochambeau's fleet sent to help the United States in the war for independence. In 1787 he was made commandant of Port-au-Prince. On the receipt of the decree of the French national assembly freeing the slaves, he refused to execute their orders, leagued with the governor against the authority of the French republic, dissolved the colonial assembly, formed a "royal corps" nick-named the *pompom blancs*, and succeeded by the arbitrary violence of his measures in opposition to the home government, in producing a counter revolution in which he was killed.

MAUI. See SANDWICH ISLANDS.



MAU'LE, a province of Chili lying between Itata and Maule rivers, and bounded by the districts of Talca, Senares, Nuble, and by the sea; 2,918 sq.m.; pop. 118,474. The soil is rolling but fertile; the staples are grain, wine, tobacco, and cattle. Wine and tobacco are exported to some extent. Chief towns are Cauquenes and Constitucion, the first being the capital and the latter a place of extensive trade, mainly with Valparaiso. The province has one railroad reaching from Chillan to Curico.

MAU'LE RIVER, rises in the Andes mountains, not far from the peak of Descabezado, and after flowing for over 150 m. in a westerly direction through Chili, empties into the Pacific about 100 m. n.e. of Concepcion and near Constitucion. It is navigable for only a few miles. It has several branches of which the chief is the Guanutil.

MAULMAIN'. See MOULMEIN.

MAUMEE BAY, at the w. end of lake Erie, and at the mouth of the Maumee river; a shallow body of water about 8 m. in diameter each way, inclosed by North point on the n., and Cedar point on the south. A light house on Turtle island between these points lights the entrance to the bay. The channel to the mouth of the Maumee is from 12 to 14 ft. in depth, was formerly very tortuous; but the government appropriations have greatly improved it of late years. Range lights have been placed on both shores to facilitate navigation. The shores are generally marshy, and afford some of the finest places for hunting water fowl in the country. The Toledo sporting association control the marshes of Cedar point for the purpose of duck hunting. On one of the northern bayous of the bay is a sulphur spring of great volume, forming a beautiful basin in the marsh, approached by skiffs only.

MAUMEE RIVER formed by the confluence, at Fort Wayne, Indiana, of the Anglaize and St. Mary's river, and flowing thence 100 m. e.n.e. to its mouth in the Maumee bay at the w. end of lake Erie. For 12 m. above its mouth it is an estuary of the lake; its waters rising and falling as the winds shift from e. to west. Its breadth in this part is from one third of a m. to a m.: its channel from 12 to 30 ft. in depth. Toledo, its commercial mart, is 4 m. from its mouth; and up to this point the channel is usually 14 ft. deep; above Toledo 10 feet. The rapids of the Maumee meet the slack water of the lake 12 m. above the mouth, are 18 m. long, with an average fall of about 4 ft. to the mile. The river from the foot of the rapids to Fort Wayne is from 400 to 100 yards wide; above the rapids its slack water is used as a part of the way for the Wabash and Miami, and Erie canals, and furnishes water for the locks down to their terminus at Toledo. The shores are low near the lake, and increase in height to the foot of the rapids, where they are 60 ft. high. Above Toledo, and below the rapids, the river is studded with low islands which, with its banks, once beautifully wooded, made a valley of great beauty. The scenery along the rapids is also beautiful. The volume of water in the river varies from spring to mid-summer like that of a mountain stream; though throughout its whole course, it flows through a flat alluvial country. In summer the rapids are frequently almost dry; yet the spring freshets are tremendous. The last

one in Feb., 1881, in conjunction with fields of unbroken ice below Toledo, and e. winds driving the water of the lake into the open funnel formed by the narrowing width of the lake, bay, and river, caused a greater rise than ever before known; inundating all the river front of the city. The reason for this unequal volume of its water is found in the capacity of the alluvial soil to absorb the summer rain falls more and more as the area of cultivation widens; while in winter the frozen ground prevents such absorption and empties a large part of the precipitation into its bed.

MAUNA KEA, the highest mountain in Polynesia. It occupies the n. and n. central portions of Hawaii, and its height was estimated by the U. S. exploring expedition to be 13,953 feet. It is an extinct volcano. During most of the year snow lies on its peaks, which are composed of gravel and reddish scoria. Its sides are covered with forests, where wild cattle range and are hunted for their horns, hides, and tallow.

MAUNA LOA, a volcanic mountain which occupies much of the central and southern portion of Hawaii. From the sea it appears domelike in shape, of no great elevation, and with very gradual slopes, partly covered with forests and sometimes crowned with snow. The top of the mountain is one expanse of lava, in some parts smooth and solid, in others cellular and scraggy. No ashes, rocks or sand are seen. Its terminal crater, called Mo Ruaweo-weo, is near 15,000 ft in length and 8,000 in breadth, the nearly perpendicular walls of its interior being in 1864 1000 ft. deep. In its quiet period the bottom is traversed by ridges from 10 to 50 ft. high, by deep chasms, beds of smooth lava, and fissures through which steam and smoke escape. The crater of Kilauea, the largest known in the world, is on the s.e. side of the mountain. It is 3¼ m. long, 2½ wide, 1044 ft. deep. At the depth of 650 ft. a ledge of black, hard lava from 600 to 2,000 ft. in width has accumulated around the sides of the cauldron, within which billows of liquid fire toss and rage. Even when comparatively inactive, red hot lava is occasionally thrown up to the height of 60 or 70 feet. In times of eruption a crater will sometimes fill with melted lava and overflow; or the internal fires will make for themselves new vent by forming fresh craters; or they will form lava fountains, throwing up continuous jets of molten material, and receiving them again in their raging depths. A sunken crater 38 ft. deep by 200 in diameter (called by lieut. Wilkes Judd's lake, from the fact that Dr. Judd, who accompanied him, was overtaken while in the crater by a sudden eruption and narrowly escaped death) discharged in 1841 by estimate 200,000,000 cubic ft. of lava. An eruption in 1855 lasted 13 months, and discharged lava over 300 sq.m. of territory. In Jan, 1859, three new craters opened in the side of the mountain, one of which, 1000 ft. in diameter, threw up a column of white hot fluid lava from 200 to 300 ft. high, continuing to play for four or five days, and illuminating the sea for 150 miles. This crater discharged itself through a subterraneous passage, and a half mile distant came to the surface and leaping a precipice of 50 ft. spread by numerous streams over the slope of the mountain, and reached the sea 40 m. from the crater in five days still at a light red heat. The meeting of the lava and the waves produced a scene terrific beyond imagination. The lava continued to flow from January to November.

MAUNDRELL, HENRY, an English traveler; 1650–1710; b. England; visited Palestine in 1697; was for several years chaplain to the English factory at Aleppo, Syria. He published in 1698, *Journey from Aleppo to Jerusalem*, a valuable work often reprinted, translated into French.

MAUNDY-THURSDAY, the Thursday of Holy Week (q.v.). The name is derived from *mandatum*, the first word of the service chanted at the washing the feet of pilgrims on that day, which is taken from John xiii. 34. The washing of the pilgrims' feet is of very ancient usage, being referred to by St. Augustine; and, both in ancient and modern times, it was accompanied by a distribution of "doles," which were handed to the pilgrims in small baskets, thence called "maunds." In the royal usage of the maund in England, the number of doles distributed was reckoned by the years of the monarch. They are usually given by the lord high almoner; but James II. performed the ceremony in person. The distribution of doles was retained till the year 1838, since which period the "Maundy" men and women receive a money-payment from the clerk of the almonry office, instead of the dole. In most mediæval countries, the maund was held in all the great houses; and in England, in the household book of the earl of Northumberland, which begins in 1512, there are entries of "al maner of things yerly yevin by my lorde of his Maundy and my laidis and his lordshippis childeren."

MAUPERTUIS, PIERRE LOUIS MOREAU DE, a French mathematician, was b. at St. Malo in 1698. He early displayed a love of mathematics, and after serving in the army for five years, withdrew from it to pursue his favorite studies. His able advocacy of Newton's physical theory, in opposition to that of Descartes, gained him general favor in Britain, and he was admitted to the royal society of London in 1727. In 1736 he was placed at the head of the academicians whom Louis XV. sent to Lapland, to obtain the exact measurement of a degree of longitude, whilst the same thing was also being done in Peru by Condamine. This operation he described in his work, *De la Figure de la Terre, déterminée par les Observations de MM. Clairaut, Camus*, etc. (Par. 1738). In 1740 he went to Berlin, on the invitation of Frederick II., to be president of the academy there; but having accompanied the Prussian army to the field, was taken prisoner at Mollwitz.

by the Austrian hussars, and sent to Vienna in 1741. He returned to Berlin shortly afterwards, and resumed his former office; but his morbid *amour-propre* and tyrannical disposition excited general dislike. Among others, Maupertuis attacked Voltaire; but the latter applied the lash of satire so vigorously, that Maupertuis was perforce compelled to return to France in 1756. In 1758, he went to Basel, for the sake of his health, and to enjoy the society of the Bernouillis, but died soon after, July 27, 1759. Maupertuis was a mathematician of ordinary ability, but a very inferior philosopher, and owed his celebrity more to the idiosyncrasies of his manners and disposition than to his merit.

MAUREPAS, JEAN FREDERIC PHELYPEAUX, Comte de, 1701–81; a minister of state in the reigns of Louis XV. and XVI. of France. The office was hereditary in his family, and embraced the affairs of the royal household, the government of Paris, and of the Marine. It fell to Maurepas at the age of 14, but was administered during his minority by the marquis de Vrilliére. Maurepas became, in fact, minister of Marine in 1723, and secretary of state in 1738. Neither great, learned, neither eminently good, or bad, he was yet a remarkable minister by virtue of an adroitness of character, and a tact in managing men, and fitting his action to the events which he could not control, that makes his long term of service interesting to the French historian and biographer. When the unfortunate Louis XVI. came to the throne, Maurepas was called from retirement to his councils. Through his influence, largely, the government made the alliance with the United States and declared war with England. He secured the entrance of Turgot and Neckar to the royal ministry, and afterwards when he found them in his way secured their dismissal. A French biographer sums him up as "the most quick-witted, charming, and seductive of ministers." Facetious writings to which Maurepas is said to have contributed, have been published under the title of *d'Etrennes de la St. Jean, d'Etrennes de la St. Martin, et de Recueil de ces messieurs.* Curious memoirs by Solavil, purporting to be of Maurepas, were published in four volumes, 1790–92.

MAURER, GEORGE LUDWIG von, 1790–1872, b. Bavaria; educated at Heidelberg, where he studied jurisprudence, to which he afterwards devoted himself, in Paris. In 1826, after holding some minor offices, he was appointed a professor at Munich. From 1832 to 1834, he had a seat in the council of regency at Athens, where he formed a code. In 1847, having been previously appointed to the council of state, he was minister of foreign affairs and justice. The most valuable, perhaps, of his various works on history and jurisprudence are, *Das Griechische Volk*, 1836; and *Geschichte der Städteverfassung in Deutschland*, 1871.

MAURER, KONRAD, b. Germany, 1823; a son of Georg Ludwig. He was appointed professor of jurisprudence at Heidelberg, in 1847, but has devoted himself specially to the cultivation of the Norse language and literature, and the jurisprudence and history of the Scandinavian peoples. Besides editing some of the Icelandic sagas, he has published *The Origin and Constitution of the Icelandic State*, Munich, 1852; and *The Conversion of the Norwegian race to Christianity*, 2 vols., 1855–56.

MAURICE, PRINCE OF ORANGE and COUNT OF NASSAU, one of the most skillful and distinguished generals of his age, was the son of William I., prince of Orange, and was b. at Dillenburg, Nov. 14, 1567. After his father's assassination in 1584, the provinces of Holland and Zealand, and afterward Utrecht, elected him their stadtholder. A great portion of the Netherlands were still in the hands of the Spaniards; but under the admirable leadership of Maurice, the Dutch rapidly wrested cities and fortresses from their enemies. In 1591, Zutphen, Deventer, Nimeguen, and other places fell into their hands; in 1593, Gertruydenberg; and in 1594, Gröningen. In 1597, with the help of some English auxiliaries, he defeated the Spaniards at Turnhout in Brabant, and in 1600 won a splendid victory at Nieuport. Finally, in 1609, Spain was compelled to acknowledge the United Provinces as a free republic. The ambition of Maurice, however, was excited to the desire of sovereignty; but in this, notwithstanding the love and respect with which he was regarded by the people, he finally failed. See BARNEVELDT. He died at the Hague, April 23, 1625.

MAURICE, (DUKE and afterwards ELECTOR) OF SAXONY, eldest son of duke Henry of the Albertine line (see SAXONY), and nephew of duke George (q. v.) the bearded, the most bitter opponent of the reformation, was b. at Freiberg, March 21, 1521; espoused, in 1541, Agnes, daughter of the landgraf Philip of Hesse; and later in the same year, succeeded his father in the duchy of Saxony and its dependencies. He was hardly well established in his dominions, till a dispute arose between him and his cousin, the elector John Frederic, regarding their respective rights over the bishopric of Meissen, which was the common property of the Ernestine and Albertine lines; but by the influence of Luther and of the landgraf Philip, a temporary reconciliation was effected. Maurice took part in the campaign of 1542 against the Turks in Hungary, and gave such signal proof of military talent, that the emperor on his return eagerly pressed him to accept a command in the armies on the western frontier of Germany. Maurice was nothing loath to continue his military career, but insisted on obtaining the protectorate of the bishoprics of Magdeburg and Halberstadt, in recompense of his services; a stipulation to which Charles would not consent. Maurice accordingly returned to his duchy, and though still on the

most friendly terms with the emperor, took part in the deliberations of the Protestant league of Schmalkald (q. v.), being himself a professed Protestant, and the son-in-law of one of the chiefs of the league. He refused, however, though agreeing with the objects of the league, to become a member; and the judicious gift to him by the emperor of the much-coveted protectorate above mentioned, and subsequently (June 19, 1546), a solemn deed of the emperor at Ratisbon, by which the Ernestine portion of Saxony and the electoral title were transferred from John Frederic to Maurice, secured the latter's energetic support. When Charles, at the commencement of the war, was cooped up in southern Germany by the army of the league, Maurice, by invading the Saxon electorate, compelled the Protestants to retire northwards, thus relieving the emperor, and enabling him to subdue Swabia and the upper Rhine districts. But by this maneuver he drew an overwhelming attack upon himself, and was driven by the incensed John Frederic from the electorate, deprived of his own dominions, and reduced to extremity. At this critical moment, the emperor came to his aid; and Maurice and the duke of Alva (see ALBA), at the battle of Muhlberg, annihilated the elector's army and took himself prisoner. Maurice was now, in accordance with the previous agreement, ruler of the whole of Saxony, with the electoral dignity; and having obtained from the emperor all the gratification of his ambitious desires which could be hoped for from that quarter, their friendly relations became more dependent upon the course of events. The retention in confinement of Philip of Hesse, whom Maurice had prevailed upon to submit to the emperor, was the first cause of estrangement; the incessant attempts of the emperor to increase, by modifications of the imperial system, his own preponderance in Germany, supplied another; and though the new elector zealously supported the interim (q. v.) of Augsburg in 1547, he gradually came to see that his close alliance with the emperor was alienating from him the affections of his Protestant subjects.

He accordingly at once abandoned the cause of the emperor with as little scruple as he had formerly sacrificed the interests of his relatives and co-religionists; and, in common with the princes of Kulmbach and Hesse, secretly sent (May, 1551) agents to Paris and London to negotiate an alliance against Charles V., while he leisurely carried on the siege of the rebellious city of Magdeburg, in order to have a pretext for keeping an army afoot. Meanwhile, Charles, at Innsbruck, was employing himself in building up vast schemes of ambition, little dreaming of the mine which the man whom he most of all confided in was preparing to spring under his feet; till the manifesto, or rather ultimatum of the Protestant princes, in which they demanded the release of Philip of Hesse, and the total abolition of the arbitrary authority of the imperial government; and the capture by them of Augsburg, while their allies, the French, took Metz; rudely drew away the veil from his eyes. Without money, without troops, without allies, nothing but a secret flight from Innsbruck appeared open to him; but he had only got as far as Füssen (a town on the Lech, on the borders of Bavaria and the Tyrol), when the news that Maurice was marching in this direction forced him to hasten again to Innsbruck. On April 18, by the mediation of Ferdinand, king of Romans, a treaty was concluded at Linz granting the demands of the Protestants; but as it was not to take effect till May 26, Maurice employed himself in attacking (May 18) the camp of Reitti, in which soldiers were being assembled for the emperor, defeated and wholly dispersed the imperialists, and advanced on Innsbruck with the view of taking Charles captive, when his progress was stopped by a mutiny in his army; and the emperor escaped. His advance on Innsbruck so alarmed the members of the council of Trent that they fled from the town, and the sittings were thenceforth suspended for some years. Finally, at a convocation of the electors and princes of the empire at Passau, the terms of a treaty of peace were discussed, Maurice directing the cause of the Protestants, and Ferdinand attending to the imperial interests; and it was ultimately agreed that Protestants were free to exercise their mode of worship; that the imperial chamber, from which Lutherans were not to be excluded, should render justice irrespective of religion; and that the Aulic council should be composed exclusively of German ministers. These conditions, which in political matters secured "Germany for the Germans," and in religious affairs permanently established the principles of toleration, were embodied in the agreement called the *Peace of Passau* (Aug. 22, 1552). The bitter dislike conceived by the emperor towards Maurice on account of these transactions, prompted him to entertain the idea of deposing him from the electorate, and reponing John Frederic; of which scheme, Maurice being apprised, he, with his usual subtlety and address, patched up a reconciliation with the emperor, and went to take part in the campaign of 1553 against the Turks, who were gradually gaining ground in Hungary. Returning soon, he found that one of his former allies, Albert, markgraf of Kulmbach, had refused to accede to the treaty of Passau, and continued the war on his own account, making raids on the ecclesiastical princes of the Rhine and Franconia. Maurice speedily discovered that the markgraf's apparent obstinacy was the fruit of a secret understanding with the emperor, who was anxious to secure the services of a general and army capable of wreaking his vengeance on the perfidious Saxon prince. So, about midsummer of 1553, Maurice, putting himself at the head of 20,000 men, marched to protect his bishopric of Magdeburg against the ecclesiastical spoliator, and falling in with him at Sievershausen, completely defeated him (July 9), but received in the conflict a bullet wound which proved fatal, July 11, 1553. Thus fell, at the early age of 32, a prince who had already established his reputation as

one of the ablest generals and diplomatists of his time. So thoughtful and reticent, so enterprising and energetic, so correct in judgment and unfailing in action, and at the same time so wholly devoid of moral sentiment, he is one of the most prominent instances of power without principle which the world's history has ever presented. His calculating, plotting mind was concealed under a jovial exterior and a genuine fondness for the favorite pastimes of the age. Yet this unprincipled dissimulator's states were the best governed of the empire; the great vassal was equal with the meanest peasant in the courts of justice; great advances were made in education; and though the least religious man of the time (in fact, honest only in this point, that he did not pretend to a piety which he did not feel), the rights of the various religious sects were strictly maintained. He died at an epoch which was big with the fate of Germany; for his settled programme of action was, after defeating the markgraf, to march upon the Low Countries, unite with the French, with whom he had formed a firm alliance against the emperor, and then attack the latter. Charles V. would have had apparently little chance of offering a successful resistance to such an overwhelming attack. See the biographies by Camerarius, Langenn, and Voigt (1876). His daughter, Anne, became the wife of William of Orange, the liberator of the Netherlands.

MAURICE, Count of Saxony (MARSHAL SAXE). See SAXE, HERMANN MAURICE, *ante*.

MAURICE, Rev. JOHN FREDERICK DENISON, D.D., a distinguished divine of the church of England, and one of the most influential thinkers of his age, was the son of a Unitarian minister, and was born in 1805. His reputation at the university for scholarship stood high, but being at this time a dissenter, and otherwise not in a position to sign the thirty-nine articles, he left Cambridge without taking a degree, and commenced a literary career in London. To this period belongs his novel entitled *Eustace Conway*. He also wrote for the *Athenæum*, which had then been recently started by James Silk Buckingham. After the lapse of two years, a change came over his religious sentiments and opinions; his spirit was profoundly stirred and influenced by the speculations of Coleridge, and he now resolved to become a clergyman of the church of England. He did not, however, return to Cambridge, but proceeded to Oxford, where he took the degree of M.A., and was ordained a priest about 1828. From that time the aim of his whole life was the interpretation of Christianity in accordance with the most pure and spiritual conceptions of our nature; nor have his labors been without result. At the time of his death there was probably no clergyman in the United Kingdom more deeply reverenced and loved than he was by a large body of the thoughtful and cultivated portion of the religious laity. He also succeeded in gathering round him, *within* the church, a large number of adherents, especially among the younger clergy, who constitute what is commonly called the "Broad Church" party, though its members repudiate any sectional tendency, and do not associate for the purpose of carrying out any sectional schemes, like the "Evangelicals" and Tractarians. Maurice's theological opinions, especially on the question of the atonement, are not considered "sound" by the "orthodox" portion of the clergy; and the publication of a volume of *Theological Essays*, in which, among other heresies, he took the charitable view of future punishments, lost him the professorship of theology in King's college, London. For many years Maurice was chaplain of Lincoln's Inn, but in 1860 he was appointed incumbent of the district church of Vere street, Mary-le-bone. He was always a warm and enlightened friend of the working classes, and founded the first working-man's college in London. Maurice became professor of moral philosophy at Cambridge in 1866, and died April 1, 1872. He wrote largely. All his works are written in the most exquisite English, and display a beauty and tenderness of Christian sentiment that are nearly faultless, but united with a subtlety of thought that frequently passes into mysticism. His principal productions are his *Mental and Moral Philosophy; Religions of the World; Prophets and Kings of the Old Testament; Patriarchs and Lawgivers of the Old Testament; The Kingdom of Christ; The Doctrine of Sacrifice; Theological Essays; Lectures on the Ecclesiastical History of the First and Second Centuries; Gospel of St. John;* and *Social Morality*.

MAURICE, THOMAS, 1753-1824; b. Hertford, Eng. After the death of his father he became a pupil of Dr. Parr, in an academy at Stanmore; entered St. John's college, Oxford, in his 19th year, but the next year removed to University college; produced while there a metrical version of *Œdipus Tyrannus* and several original poems, and under his tutor, lord Stowell, he cultivated his taste for historical research. After graduating he was ordained, and appointed curate of Woodford in Essex, resigning in 1785 for a pastorate at Epping. In 1791 his *Indian Antiquities* began to appear, and was completed in 1797 in 7 volumes. His *History of Hindustan*, which he had begun to publish in 1795, was finished in 3 volumes in 1799. In 1798 he was appointed by earl Spencer vicar of Wormleighton in Warwickshire. In 1799 he was appointed assistant librarian in the British museum, and in 1800 received the pension left vacant by the death of the poet Cowper. His *Modern History of India* was published in 1802 and 1804. In 1804 he was presented by the lord chancellor to the vicarage of Cudham in Kent. Among his last works were *Memoirs Comprehending the History of the Progress of Indian Literature;* and *Anecdotes of Literary Characters in Britain* during a period of 30 years.

MAURICIUS, one of the greatest of the Byzantine emperors, was descended of an ancient Roman family, and was b. at Arabissus, in Cappadocia, about 539 A.D., and executed Nov. 27, 602. During the reigns of Justin II. and Tiberius, Mauricius served in the army, and in 578 was appointed by the latter emperor to the command of the army against the Persians, in which office he gained the universal esteem of his soldiers, notwithstanding the severity of his discipline, and surpassed the emperor's hopes by humbling to the earth the most dangerous enemy of the eastern empire. In 582 he obtained the rare honor of a triumph at Constantinople, and in August of the same year succeeded Tiberius on the throne. Immediately after his accession, the Persians invaded the Byzantine territories; an army was sent to repel them, and the war between the empires soon became general; a fierce contest of eight years' duration, which, chiefly owing to the internal convulsions that distracted Persia, resulted in favor of the Byzantines. The king of Persia, Khusru II., driven from his throne, fled to Hierapolis, whence he sent to Mauricius a letter beseeching shelter and aid. The emperor's generous nature was not proof against such an appeal: an army was immediately assembled, to which the loyal Persians flocked from all quarters; and in 591, Khusru was restored to his throne, giving up to Mauricius, in evidence of his gratitude, the fortresses of Dara and Martyropolis, the bulwarks of Mesopotamia. Some time after these events, a war broke out with the Avars; and after two years of bloody conflict, with little gain to either side, the Byzantines suffered a severe defeat, and 12,000 veterans were taken prisoners. Mauricius refused to ransom them, and they were consequently put to death. Mauricius's conduct has been satisfactorily accounted for (see Gibbon's *Decline and Fall*), but it excited a deep and lasting resentment amongst the people and the army; and in 602, when the emperor ordered his troops to take up their winter-quarters on the north (or Avarian) side of the Danube, they broke out into open revolt, elected Phocas for their chief, and marching upon Constantinople, raised him to the throne. Mauricius, with all his family and many of his friends, was put to death. He was a general of rare ability, and little inferior as a ruler.

MAURITA'NIA, or MAURETANIA, the ancient name of the most north-western part of Africa, corresponding in its limits to the present sultanate of Morocco and the western portion of Algiers. It derived its name from its inhabitants, the *Mauri* or *Maurusii*. See MOORS. It reached on the south to the desert, and was separated from Numidia on the east by the river Mulucha or Molochath, now the Muluya.

MAURI'TIA, a genus of palms, having male flowers and female or hermaphrodite flowers on distinct trees, imperfect spathes, and fan-shaped leaves. They are all natives of the hottest parts of America. Some of them, like the buriti (q.v.) palm (*M. vinifera*), have lofty columnar smooth stems; others are slender, and armed with strong conical spines. The MIRITI palm (*M. flexuosa*) grows to the height of 100 feet; it has very large leaves on long stalks. The stem and leaf-stalks are used for various purposes. A beverage is made from the fruit, as from that of the buriti palm and several other species.

MAURI'TIUS, or ISLE OF FRANCE, an island of the Indian Ocean, belonging to Great Britain, lies in lat. 19° 58′ to 20° 33′ s., and long. e. from Greenwich 57° 17′ to 57° 46′. It contains about 708 sq.m.; pop. (1871), including the small dependencies of Seychelles, Rodrigues, etc., and exclusive of the military, 318,584, giving the very high average of 450 to the sq. mile. Of the total population, 210,636 were, in 1870, estimated to be Indian coolies. The surface is of varied formation, a great portion being volcanic; while its coast is fringed by extensive coral reefs, pierced in several places by the estuaries of small streams. Its mountains, although of no great height, are marked by the usual irregularities observed in volcanic formations. Of these, the most celebrated is the Peter Botte, situated in the rear of the town of Port Louis, and forming a remarkable cone, sustaining on its apex a gigantic piece of rock, which has the appearance of being poised upon its summit with the nicest precision. In the island are the remains of several small craters, and the traces of lava are numerous. The principal towns are Port Louis, the capital, and Grande Port, or Mahébourg, the southern port, the latter difficult of access for shipping, and much encumbered with coral reefs. Port Louis comprises a spacious harbor, and is provided with an inner basin, denominated the Fanfaron, wherein vessels can take refuge during the hurricanes, which occasionally occur here with exceeding violence. There is also a slip upon which large vessels can be raised for the purpose of examination and repair.

Mauritius produces annually a large amount of sugar, which it exports to England, France, and Australia. The nature of the soil, however, in many parts prevents a more universal development of the culture of this article of commerce. In some districts, considerable tracts of cane-growing land are encumbered with large bowlders; in many places these have been collected into rough walls, between which the canes are planted, while in others their size precludes their removal. The method employed in the cultivation of the cane is similiar to that adopted in the West Indies; but the bulk of the sugar is ultimately shipped in bags composed of the leaf of the Vacoua palm. The climate of this island is remarkably fine. There are four seasons, as in England; but the temperature in the months of November, December, and January is very high. Throughout the year, the thermometer ranges from 76° to 90° in the shade. In some of the more

elevated districts, however, the climate resembles that of the hills of India, and the thermometer usually stands 7° or 8° lower than in Port Louis. The southern portion of the island, called La Savanne, is exceedingly beautiful, and diversified with mountain and ravine, clothed with luxuriant wood. The mountains themselves are bold and fantastic, and present every possible form of outline. Few communities present so varied an admixture as that of Mauritius. The descendants of the original French inhabitants represent a considerable portion of the influential classes; government officials and merchants, or planters of English birth or extraction, make up the remainder. In Port Louis may be seen representatives of almost every eastern nation. Many Chinese find their way here, and there is now scarcely a hamlet that has not its Chinese storekeeper The Creoles, or native colored population, who derive their color from the African and Malagash slaves, form a very considerable portion of the inhabitants. Emigration of coolies from British India, for the supply of the sugar plantations, still continues. There are two lines of railway, accompanied by telegraph lines. Some much-needed sanitary measures have been carried out. Roads have been made, bridges built, and a light-house has been erected off Grande Port. At St. Louis are spacious docks. Hospitals have been founded, and the establishment of savings-banks has proved beneficial. In March, 1868, the island experienced a most calamitous hurricane; and during three or four years previous to 1870, a fearful epidemic raged. The revenue for 1874 amounted to £720,130, the expenditure to £727,064. In 1873, vessels having an aggregate burden of 517,892 tons entered and cleared the ports. The imports for 1874 (chiefly live-stock, rice, guano, grain, wine, machinery) were valued at £2,584,120; the exports (mainly sugar, with some rum and copper), at £3,020,353.

Mauritius was discovered in the year 1505, by the Portuguese commander, Don Pedro Mascaregnhas, and was subquently visited by the Dutch under Van Neck in 1598, who gave the island its present name in honor of Prince Maurice. The Dutch formed a settlement here in 1644, but subsequently abandoned it. A new and more successful attempt to form a permanent establishment was made by the French in 1721, already in in possession of the adjacent island of Bourbon, who re-named it "Ile-de-France." Mauritius remained in French hands until near the close of the year 1810, when it was taken by the British in an expedition under gen. Abercromby, and has since remained a British possession.

MAUROCORDA'TOS, also MAVROCARDATO, a Fanariote family, distinguished for ability and political influence, and descended from merchants of Chios of the Genoese family of Scarlati.—ALEXANDER M. was professor of medicine and philosophy in Padua, and became dragoman or interpreter to the porte in 1681, in which capacity he did much to promote the interests of his countrymen. In 1699, he displayed great diplomatic talents as plenipotentiary of the porte in the negotiations for peace at Carlovicz.—His son, NICOLAS, was the first Greek who was hospodar of Moldavia and Wallachia.—CONSTANTINE, brother of Nicolas, who became hospodar of Wallachia in 1735, abolished slavery in that country, and introduced the culture of maize.—His grandson, ALEXANDER, Prince M., b. at Constantinople in 1787, took an active part in the Greek contest for independence, prepared the declaration of independence and the plan of a provisional government, was elected president of the executive body; and being appointed commander-in-chief, undertook, in 1822, an expedition to Epirus, which ended in the unsuccessful battle of Peta; but he delivered the Peloponnesus by his bold and resolute defense of Missolonghi (1823). Notwithstanding the opposition of the party of Colocotronis and Dimitrios Ypsilanti, he was able afterward to render important services to his country—as, for instance, by the heroic defense of Navarino and Sphacteria; but became very much involved in political strife. He was a steadfast admirer of English policy and institutions, and a fierce opponent of the pro-Russian government of Capo D'Istrias. After the accession of king Otho, he was at different times a cabinet minister and ambassador at different courts. The leading feature of his policy—viz., his endeavor to promote British influence—made him at times very unpopular among his countrymen. Yet, at the outbreak of the Crimean war, it was found necessary to place him once more at the head of the government—a dignity, however, which he soon resigned; but he continued to interest himself in the cause of education, and as late as 1861 held the office of minister of public instruction. He died August, 1865.

MAURY, a co. in central Tennessee; pop. '80, 39,945—18,169 colored; 580 sq.m.; it is drained by the Duck river and its branches and intersected by a branch line of the Louisville and Nashville railroad. The soil is highly diversified and the natural and manufactured products very large. In 1870 nearly 1,500,000 bushels of Indian corn were raised and large quantities of wheat, tobacco, butter, hay, and cotton. There are tanneries, flour mills, and several factories connected with the manufacture of cloth. Chief town, Columbia.

MAURY, JEAN SIFFREIN, Cardinal 1746–1817; b. at Valréas, Venaissin; son of a shoemaker; educated for the priesthood at Avignon; went to Paris at the age of 20 as *abbé précepteur*, but devoted himself to preaching, and by his panegyrics on St. Louis in 1772 and on St. Augustine in 1775, he took the highest rank as a pulpit orator. Appointed preacher to the court he obtained the abbey of Frénade and the priory of Lihons, and also a seat in the academy. In 1785 he pronounced an eloquent panegyric on St. Vincent de Paul.

In 1789 he was chosen deputy of the clergy to the states-general, where he was prominent in defense of the church and royalty; and with great vigor, skill, and eloquence opposed the revolutionary measures until the flight of Louis XVI. At the dissolution of the constituent assembly he left France in 1791 and at the invitation of Pius VI. took up his residence in Rome where he was received with great honor. In 1794 he was made archbishop of Nicæa *in partibus* nuncio to the diet at Frankfort for the election of emperor Francis II., cardinal and bishop of Montefiascone and Corneto. On the invasion of Italy by the French in 1798 he fled in disguise to Venice, and thence went to St. Petersburgh. Returning in 1799 he was appointed by the count of Provence, afterwards Louis XVIII., his ambassador to the holy see. Becoming reconciled to Napoleon he returned to France in 1806. In 1810 he was appointed archbishop of Paris, and when ordered by the pope Pius VII., who was taken captive by Napoleon, to relinquish the administration of his diocese, he disobeyed and was after the restoration imprisoned for a short time at Rome. After this he retired to private life. He published a valuable treatise, entitled *Essai sur l'eloquence de la Chaire* in 2 volumes.

MAURY, MATTHEW FONTAINE, LL.D., an American naval officer, astronomer, and hydrographer, was b. in Virginia, Jan. 14, 1806. In 1825 he was appointed midshipman in the U. S. navy, and during a voyage round the world in the *Vincennes* frigate, commenced a treatise on navigation, which is adopted as a text-book in the navy. In 1836 he was made lieutenant; but being lamed by an accident, and unfitted for service afloat, he was appointed to the hydrographical office at Washington. Here he carried out a system of observations which enabled him to write his *Physical Geography of the Seas*, and to produce in 1844 his works on the gulf stream, ocean currents, and great circle-sailing. He projected the maritime conference at Brussels (1853); and with the co-operation of the British government, and the assistance of naval officers and the learned, completed his sailing charts, to the great advantage of the commerce of the world. In 1855 he was promoted to the rank of commander, and published *Letters on the Amazon and Atlantic Slopes of South America*. At the outbreak of the civil war in 1861, Maury took a command in the confederate navy, and afterwards came as commissioner to Europe. After the war, he returned to the United States. He died Feb. 1, 1873.

MAUSER GUN, the name of the rifle invented by a gunsmith named Mauser of Kannstadt, Würtemberg, in 1871, and used by the Prussians in the war with France. While embracing the advantages of the Bavarian Werder gun, it is of longer range and more rapidly loaded and discharged than the needle-gun. It is of light weight and very simple in construction. It is now in general use in the army of the German empire.

MAUSOLEUM, a sepulchral monument of large size, containing a chamber in which urns or coffins are deposited. The name is derived from the tomb erected at Halicarnassus to Mausolus, king of Caria, by his disconsolate widow, Artemesia, 353, B.C. It was one of the most magnificent monuments of the kind, and was esteemed one of the seven wonders of the world. It was described by Pliny and other ancient writers, as late as the 12 c., and must have been overthrown, probably by an earthquake, during the following two centuries, for all trace of it had disappeared, except some marble steps, when the knights of St. John of Jerusalem, in 1404, took possession of the site of Halicarnassus, then occupied by a small village called Cleesy. While excavating among the ruins for building materials, the knights discovered a large chamber decorated with marble pilasters, and with richly inlaid panels. The sarcophagus of the founder was also discovered in another great hall.

Excavations have been recently made by Mr. Newton, assisted by the British government, and he has succeeded in bringing to light many of the beautiful sculptures of the mausoleum. Amongst others, the fragments of the statue of king Mausolus (now pieced together in the British museum), and a portion of the quadriga which crowned the monument. Many fragments of lions, dogs, etc., and a beautiful sculpture of a horse, have been found. Portions of friezes, of fine design and workmanship, the subjects of which invariably are Greeks in conflict with Amazons, have also been dug up.

The plan of the basement has been traced) the area being 126 ft. by 100 ft. and from the fragments of columns, Ionic capitals, etc., which have been found, the description of Pliny has been verified. The mausoleum consisted of a basement 65 ft. high, on which stood an Ionic colonnade 23½ ft. high, surmounted by a pyramid, rising in steps to a similar height, and on the apex of which stood a colossal group, about 14 ft. in height, of Mausolus and his wife in the quadriga; these statues are supposed to be the work of the celebrated Scopas. The above dimensions are from Mr. Newton's restoration, but they are disputed by Mr. Fergusson, and others. All agree that the total height of 140 ft. given by Pliny is probably accurate.

MAUVAISES TERRES, or BAD LANDS, the name of several different tracts of desolate, treeless, waste and broken land in Dakota, Nebraska, Colorado, and other territories of the United States, but applicable especially to a section along the White river, an affluent of the Missouri. These sections are of the tertiary formation, and abound in relics of extinct species of rhinoceros, hyæna, and other mammals. Some parts of these lands yield a coarse, scanty pasturage after heavy rains, but for the most part they are utterly barren.

MAUVE, See DYE-STUFFS.

MAVERICK, a co in s.w. Texas, bounded on the s. by Mexico; 1200 sq.m.; pop. '80, 2,967; drained by Elm creek and the branches of the Rio Grande which forms its s.w. boundary. The surface is for the most part level and adapted for cattle-breeding which is carried on to some extent. There is very little agricultural production. Chief town, Eagle Pass.

MAVROC-ORDA'TOS. See MAUROCORDATOS, *ante*.

MAW-SEED, a name by which poppy-seed (*Papaver somniferum*) is sold as food for cage-birds. It is given to them especially when they are molting.

MAX, GABRIEL, a German artist, a resident of Munich. His subjects are idealizations from the poets, spiritual in the highest degree, and in execution simple, noble, and effective. "Gretschen on the mountain side on Walpurgis Night," "The Lion's Bride," "The Christian Martyr"—a young girl left to the tigers in the arena of the Coliseum—are among his great works, which have become widely known through recent engravings and photographs. Max is in the prime of his powers, reserved among strangers, but quite social among intimates. He ranks as one of the most eminent living artists of Germany.

MAXCY, JONATHAN, D.D., 1768–1820; b. Mass.; entered Brown university at the age of 15, and graduated in 1787; was tutor 1787–91, during which time he studied theology, and in 1790 was licensed to preach; installed pastor of the First Baptist church, Providence, 1791, and also was elected a trustee and professor of divinity in Brown university. In 1792, at the age of 24, he became its president. In 1802 he was elected president of Union college, N. Y.; and in 1804 resigning, he accepted the presidency of South Carolina college at Columbia, retaining it until his death. He was an eloquent preacher, and learned in philology and moral philosophy. Some of his sermons, including one on *The Existence of God demonstrated from the Works of Creation*, and his *Literary Remains, with a Memoir*, were published, edited by Romeo Elton, D.D.

MAXENTIUS. See CONSTANTINE I., the Great, *ante*.

MAXFIELD, THOMAS, 1720–85; b. England; converted to the faith of John Wesley by the preaching of the great Methodist divine at Bristol; was his substitute in the Foundry church, London, in prayer and expounding the Scriptures, but was not permitted to preach. Nevertheless, led by his evident popularity he attempted to preach, and succeeded so well that Wesley, who was strongly in favor of the strict discipline of the church, listened to the counsel of his mother to hear him before denouncing him, and then granted him leave to preach. He was the first itinerant lay-preacher in the Methodist denomination. In 1744 he attended the first conference at the Foundry church, having been ordained in Ireland by the bishop of Londonderry, who was friendly to Wesley. He was introduced by Wesley into London society, where he contracted a marriage with a lady in a position far superior to his own. In 1746 he attended the third conference at Bristol, and was persecuted in company with other followers of Wesley, being at one time kidnaped and pressed into the king's service. In 1764 he became estranged from Wesley on account of some disagreement in church matters, and associated himself with Bell, an ex-life-guardsman turned local preacher, who, possessing great personal magnetism and wild enthusiasm, had a powerful influence over him. He joined Bell in advocating doctrines so strongly opposed to the reasonable interpretation of the Scriptures, that a decided breach was made between his followers and Wesley, and he withdrew from the Foundry church and founded a society of 170 members who had seceded with him. He continued with this people for 20 years, and when helpless from a stroke of paralysis, Wesley remembered and visited him, and afterward preached to his people in the chapel which he had occupied.

MAXIMIANUS I. See DIOCLETIAN, *ante*.

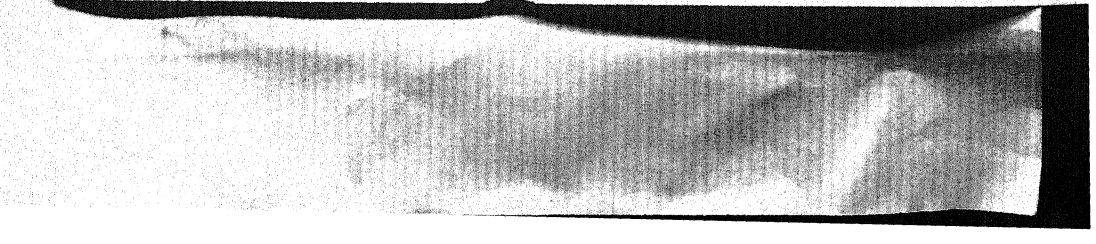
MAXIMIANUS II. See GALERIUS, *ante*

MAXIMILIAN I., one of the most distinguished of the German emperors, the son and successor of Frederick III., was b. at Neustadt, near Vienna, March 22, 1459. In his 19th year he married Maria, the only child and heiress of Charles the bold, duke of Burgundy, and was soon involved in war with Louis XI. of France, who attempted to seize some of her possessions. Maximilian, although successful in the field, was compelled, by the intrigues of Louis in the Netherlands, and disaffection stirred up there, to betroth his daughter Margaret, a child of four years old, to the dauphin, afterwards Charles VIII., and to give Artois, Flanders, and the duchy of Burgundy as her dowry. In 1486 he was elected king of the Romans. Insurrections in the Netherlands, encouraged and supported by France, occupied much of his time, and again involved him in war with Louis XI. He afterwards repelled the Hungarians, who had seized great part of the Austrian territories on the Danube; and the Turks, who in 1492 invaded Carinthia, Carniola, and Steiermark. He again took up arms against France, because Charles VIII. sent back his daughter, and married Anne of Bretagne, in order to acquire that great province. A peace was, however, soon concluded at Senlis in 1493, Maximilian receiving back the provinces which he had given with his daughter. On the death of his father in 1493, he became emperor, and he subsequently married Bianca Sforza, daughter of the duke of Milan. He applied himself with wisdom and vigor to the internal

administration of the empire, took measures for the preservation of peace in Germany, and encouraged the cultivation of the arts and sciences. But he was soon again involved in wars against the Swiss, the Venetians, and France. He sought to put a stop to French conquests in Italy, and was at first successful; but after various changes of fortune, and years of war, mingled with many political complications, he was compelled to give up Milan to France, and Verona to the Venetians. Nor was Maximilian more successful against the Swiss, who in 1499 completely separated themselves from the German empire. The hereditary dominions of his house, however, were increased during his reign by several peaceful additions; and the marriage of his son Philip with the Infanta Juana, and of his daughter Margaret with the Infant Juan of Spain, led to the subsequent union of Spain with Austria; whilst the marriage of two of his grandchildren with the son and daughter of Ladislaus, king of Hungary and Bohemia, brought both these kingdoms to the Austrian monarchy. Maximilian died at Wels, in Upper Austria, Jan. 12, 1519. He was of a chivalrous character. He wrote various works on war, gardening, hunting, and architecture, some poems, and an autobiography full of marvels.

MAXIMILIAN II., JOSEPH, King of Bavaria, son of Ludvig I., was b. Nov. 28, 1811. He married in 1842 the princess Maria Hedwig, cousin to the present king of Prussia. Until 1848 he took no part in political affairs, but devoted himself to agricultural and other improvements, and to the pursuits of literature and science. In that year of the revolutionary excitement, he was suddenly called to the throne, on his father's abdication, and adopted a policy accordant with the liberal tendencies of the time. Reactionary measures were afterwards to some extent adopted; but Maximilian's reign was chiefly signalized by the encouragement of science. He was regarded with no favor by the ultramontane party, but without respect to their opposition, he brought to Munich men of liberal opinions, eminent in literature and science. He died Mar., 1864.

MAXIMILIAN, EMPEROR OF MEXICO, otherwise FERDINAND MAXIMILIAN JOSEPH, Archduke of Austria, was b. on July 6, 1832. He was the son of the archduke Francis Charles, and the younger brother of Francis Joseph I. Maximilian, who received a careful education, was very popular as governor of the Lombard-Venetian kingdom. In 1862 the French were induced to interfere in the affairs of Mexico and in 1863 called together an assembly of notables. This body decided in favor of monarchy; and a deputation was appointed to offer the crown of Mexico to Maximilian. After deliberation he solemnly accepted it; and in June, 1864, he entered Mexico. He was of course warmly welcomed by the clergy and the army; but he soon found that they expected him to sanction abuses which he felt bound to condemn; though he gained the support of the liberals. For a time all went well; but he vainly tried to reconcile Mexican parties, who had no other object in view than power and place. A proclamation he was induced to make in Oct., 1865, threatening to punish with death under the laws of war all who offered resistance to the government (asked for merely to suppress brigandage), was so employed both by the imperialist and French commanders, that under it many estimable liberal officers were cruelly shot as robbers. Juarez and his followers again raised the standard of independence. At the same time, Louis Napoleon had to contemplate the withdrawal of his troops. In vain the empress, a daughter of Leopold I. of Belgium, went to Europe to enlist support for her husband; her reason gave way under the continued grief and excitement brought on by disappointment. The French were most anxious that Maximilian should leave with their troops; but he felt bound as a man of honor to remain, and share the fate of his followers. At the head of 10,000 men, he made a brave defense of Queretaro against a liberal army under Escobedo. On the night of May 14, 1867, gen. Lopez betrayed him. The liberal minister of war ordered Maximilian and gens. Miramon and Mejia to be tried by court-martial; and it was in vain the European ministers protested against this breach of the laws of civilized warfare. The trial was of course a mere farce, and the charges chiefly rested on the proclamation above referred to and the executions which followed it. On July 19, the three prisoners were shot. After some delay, the body of Maximilian was given up to his relatives, and was conveyed to Europe in an Austrian frigate. After the death of Maximilian, his writings were published under the title of *Aus Meinem Leben; Reiseskizzen, Aphorismen, Gedichte,* etc. (7 vols. 1867).



MAXIMIN, CAIUS JULIUS VERUS MAXIMINUS, a Roman emperor; b. in the latter part of the 2nd century. He was originally a Thracian shepherd. Attracting the attention of the emperor Septimius Severus by his immense size and wonderful feats of strength and agility, he was admitted to the army; was rapidly advanced for his bravery, put in command of a new legion raised in Pannonia, and obtained great influence over the soldiers. At the head of this legion he followed Alexander in his campaign against the Germans. When the army was encamped on the banks of the Rhine, he conspired against Alexander, and caused him to be put to death in his tent, with his mother Mammæa, A.D. 235, Being proclaimed emperor, he named his son Maximus Cæsar, and made him colleague in the empire. He continued the war against the Germans, and devastated a large part of the country beyond the Rhine. But his cruelty and rapacity aroused the indignation of the people. For alleged conspiracy against him he put to death Magnus, a senator, with 4,000 other persons, and for the imperial treasury confiscated the municipal property. He also opposed Christianity, and persecuted the bishops who had been

favored by Alexander. The provinces of Africa revolted and proclaimed Gordianus, who was soon after acknowledged by the senate and people. Rome, fearing the vengeance of Maximin, the senate proclaimed emperors Clodius Papienus Maximus and Decimus Cælius Balbinus, and with them was associated by order of the people a nephew of the younger Gordianus. Maximin having crossed the Isonzo, laid siege to Aquileia in Italy, but met with strong resistance from the garrison and people. The soldiers mutinied and killed both him and his son in 238. Maximin was a fierce soldier, and his son a handsome but arrogant youth.

MAXIMS, LEGAL, a term used by members of the legal profession and writers on jurisprudence to denote those brief and pithy utterances, which by general consent have been accepted as embodying in proverbial form the accumulated wisdom of the past, the well-determined general principles which are the foundation of both law and equity. As these general principles are founded on the natural law of justice, safety, and public policy, they are not liable to change by statute or local enactment; and however the legislative power may see fit to apply them in particular instances, the basis of the law is the same in all countries. Hence it follows that the utterances of ancient Roman magistrates and authors of legal treatises remain to this day of as much force and truth as when first promulgated. As the code of Justinian forms the basis of the civil law, still in force over most countries of Europe, and as the works of all the earlier writers of our English common law were couched in the Latin language, it is not surprising that by far the largest number of these maxims are in Latin, which tongue, moreover, is adapted to give such maxims their needful condensation and precision. In very few instances can the maxims be traced to their original sources; many are derived from the Roman law; many are from continental jurists of the middle ages; while a very large number were enunciated by early English judges and writers, and still others are of quite modern origin. The form in which they are expressed is often varied and in many cases an abbreviated form is employed by most lawyers in place of the full utterance. Like other expressions of the common law, the maxims derive their force and authority in the first place through the truth and justice of the principles which they enunciate, and, secondly, through the universality of their acceptance and application by courts in the past. They are not, therefore, of absolutely equal and binding authority, or rather it is impossible to draw a line strictly dividing accepted maxims from mere expressions of opinion. While it has been said that maxims resembled both mathematical axioms and proverbs, it is true that they differ from both materially in their nature, being more the outcome of inductive reasoning than are axioms, and more carefully framed and specifically applicable than proverbs. The number of those universally accepted as law is very large indeed. Works devoted entirely to the consideration of the meaning and application of this form of law have been published by several authors. Perhaps it would be safe to put the number of those maxims which are properly so-called, not mere *dicta*, and which are in common use, as not less than two hundred. If the definition be made broader in both respects, we must add to this many hundreds. Bouvier in his *Law Dictionary* gives a very complete list, which cannot fall far short of two thousand distinct maxims. The reader will most easily understand the nature and style of this class of pithy legal sayings by examining a few which are selected from the great mass, mainly with regard to their brevity and frequent use. Such are: *caveat emptor*—let the buyer be on his guard—a most important principle of the law of contracts, but not to be construed too strictly; *Qui facet per alium, facit per se*—he who acts by another, acts himself—in which may be seen the main principle of the law of agency; *Æquitas sequitur legem*—equity follows the law; *Ex nihilo nihil fit*—from nothing comes nothing; *Fraus est celare fraudem*—to conceal a fraud is itself a fraud; *A l'impossible nul n'est tenu*—no one is bound to do what is impossible, the language being what is called "law French"; *Ubi jus, ibi remedium*—where there is a right there is a remedy; *Ignorantia legis neminem excusat*—ignorance of the law excuses no one; also expressed by *Ignorantia facti excusat, ignorantia legis non excusat*—ignorance of fact, but not of law is an excuse; *Prior tempore, potior jure*—first in time, first in right; *Id certum est, quod certum reddi potest*—that is certain which may be rendered so. Among those commonly given in English may be mentioned: Acts indicate the intention; When the equities are equal the law shall prevail; When the foundations fail, all fails; Once a fraud, always a fraud.

As may be readily perceived, the difficulty in practically employing these and the many similar maxims, is twofold; first, in correctly amplifying and expounding the extended meaning sought to be conveyed in the condensed form; and, secondly, in properly applying it to the adjudication of the particular facts of the case in question; and it is the work more especially of the writer of treatises on the various branches of law and equity to perform the first duty; while to the active practitioners and to the judges emergencies are constantly presented, calling for the exercise of the latter function.

MAXIMUM, in mathematics, the greatest value of a variable quantity or magnitude, in opposition to *minimum*, the least. More strictly, a maximum is such a value as is greater than those immediately preceding and following it in a series; and a minimum is a value which is less than those immediately preceding and following it, so that a function may have many maxima and minima unequal among themselves, as in the case of a

curve alternately approaching and receding from an axis. Traces of the doctrine of maxima and minima are to be found in the works of Apollonius on conic sections. The thorough investigation of them requires the aid of the differential calculus, and even of the calculus of variations. The brothers Bernouilli, Newton, Maclaurin, Euler, and Lagrange, have greatly distinguished themselves in this department of mathematics. The Hindus have displayed great ingenuity in solving, by ordinary algebra, problems of maxima and minima, for which, in Europe, the calculus was considered to be necessary.

MAXWELL, HUGH, 1787–1873; b. Scotland, and brought to the United States in childhood; graduated at Columbia college in 1801, and entered the profession of the law in New York, where he became prominent as a learned and skillful advocate. He was assistant judge-advocate general of the U.S. army in 1814, and district attorney for New York county in 1819, and again in 1822–29. He took a distinguished part in the "conspiracy trials" of 1823, and was collector of the port of New York 1849–53. He was a prominent whig politician.

MAXWELL, JAMES CLERK-, one of the greatest of modern natural philosophers, was the only son of John Clerk-Maxwell of Middlebie, a cadet of the old Scottish family of Clerk of Penicuick. He was b. in 1831 and died in November, 1879. He was educated in boyhood at the Edinburgh academy. His first published scientific paper was read for him by prof. Forbes to the Royal society of Edinburgh before he was fifteen, and when he had received no instruction in mathematics beyond a few books of Euclid, and the merest elements of algebra. He spent three years at the university of Edinburgh, working with physical and chemical apparatus, and devouring all sorts of scientific works in the library. During this period he wrote two valuable papers, *On the Theory of Rolling Curves*, and *On the Equilibrium of Elastic Solids*. Thus he brought to Cambridge, in the autumn of 1850, a mass of knowledge which was really immense for so young a man, but in a state of disorder appalling to his private tutor. But by sheer strength of intellect, though with the very minimum of knowledge how to use it to advantage under the conditions of the examination, he obtained in 1854 the position of second wrangler, and was equal with the senior wrangler in the higher ordeal of the Smith's prize.

In 1856 he became professor of natural philosophy in Marischal college, Aberdeen; in 1860 professor of physics and astronomy in King's college, London. He was successively scholar and fellow of Trinity; and was elected an honorary fellow of Trinity when he finally became, in 1871, professor of experimental physics in the university of Cambridge. There can be no doubt that the post to which he was ultimately called was one for which he was in every way pre-eminently qualified; and the Cavendish laboratory, erected and furnished under his supervision, remains as remarkable a monument to his wide-ranging practical knowledge and theoretical skill as it is to the well-directed munificence of its noble founder. In clearness of mental vision, in power of penetration, and in the possession of that patient determination to which Newton ascribed all his success, Maxwell is to be ranked with Faraday. He was too rapid a thinker to be a good lecturer, except for the very highest class of students. The great work of his life is undoubtedly his treatise on *Electricity and Magnetism* (2 vols. 1873). He had previously, from 1856 onward, published various papers on these subjects, following very closely the experimental procedure of Faraday. His great object was to construct a theory of electricity in which "action at a distance" should have no place; and his success was truly wonderful. There can be little doubt that he has succeeded in laying the basis of a physical theory of electric and magnetic phenomena, quite as securely founded as in the undulatory theory of light: and the luminiferous ether, which is required for the one series of phenomena, is shown to be capable of accounting for the others also. One grand test is found in the fact that, if his hypothesis be correct, the velocity of light ought to be equal to the ratio of the electrokinetic unit to the electrostatic unit. We are not yet sure of either quantity to within two or three per cent; but the most probable values of each agree so well as almost to put the hypothesis beyond doubt. In *Nature*, vol. vii. p. 478, the reader will find an account of the more remarkable discoveries in this extraordinary book, which suffices of itself to put Maxwell in the very front rank of scientific men.

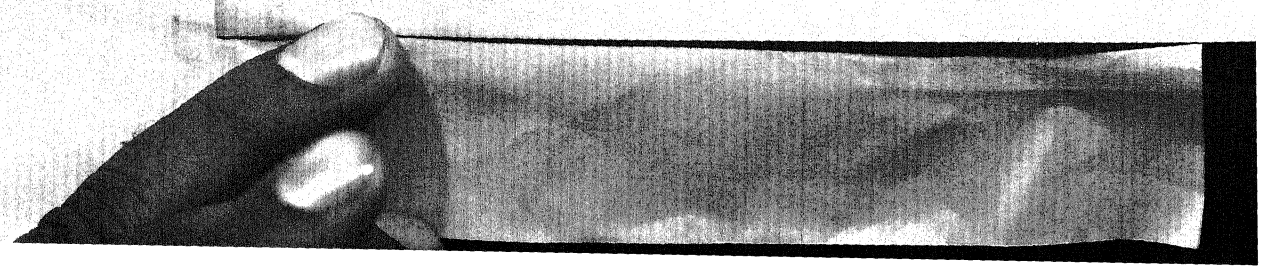
Another subject to which he devoted much attention, and in which his numerous discoveries were acknowledged by the award of the Rumford medal, was the perception of color, the three primary color sensations, and the cause of color-blindness. He was the first to make color-sensation the subject of actual measurement.

He obtained the Adams prize from the university of Cambridge for his splendid discussion of the dynamical conditions of stability of the ring-system of Saturn, in which he showed that the only hypothesis consistent with the continued existence of these rings is that they consist of discrete particles of matter, each independently a satellite.

He was perhaps best known to the public by his investigations on the kinetic theory of gases, with their singular results as to the nature of gaseous friction, the laws of diffusion, the length of the average free path of a particle, and the dimensions of the particles of various gases. His Bradford "Discourse on Molecules" is a classic in science.

Besides a great number of papers on various subjects, mathematical, optical, dynamical, he published an extraordinary text-book of the *Theory of Heat* (which has already gone through several editions) and an exceedingly suggestive little treatise on *Matter and Motion*. In 1879 he edited, with copious and very valuable original notes, *The Electrical*

Researches of the Hon. Henry Cavendish, a work which shows that that remarkable man had (a hundred years ago) made out for himself much of what was till very lately looked upon as one of the chief triumphs of the present century.



Maxwell obtained the Keith prize of the royal society of Edinburgh for a valuable investigation of stresses and strains in girders and frames; he took a prominent part in the construction of the British association unit of electrical resistance, and in the writing of its admirable reports on the subject; and he discovered that viscous fluids, while yielding to stress, possess double refraction. He was excessively ingenious in illustration, especially by means of diagrams; and possessed a singular power of epigrammatic versification, as the reader of *Nature* and *Blackwood* cannot fail to remember. Some of his last and very best scientific work adorns and enriches the new edition of the *Encyclopædia Britannica*. In these days of materialism it is not superfluous to record that he was, in the full sense of the word, a Christian; and that he asserted that he had examined every form of atheism which he had met, with the result of finding that all ultimately required the recognition of a personal God.

MAXWELL, WILLIAM, 1735–98; b. probably in Ireland; entered the army in America in 1758, and took part in the French war and the war of the revolution; was col. of a New Jersey battalion in the Canadian campaign of 1776; commanded the New Jersey brigade in the battles of Brandywine and Germantown; was engaged in the pursuit of Clinton in New Jersey, and took a prominent part in the battle of Monmouth; was engaged in Sullivan's expedition against the Indians in 1779, and in the battle of Springfield in 1780, shortly after which he resigned. He enjoyed the esteem and confidence of Washington.

MAXWELL, WILLIAM HAMILTON, 1794–1850; b. in Ireland; and when 19 years of age graduated at Trinity college, Dublin. After traveling some years he took orders in the English church, and was in 1820 made rector of Ballagh, county Connaught. As there was not at that time a single Protestant in the parish, Maxwell found leisure to engage in literary pursuits. He wrote in all about 20 volumes, most of which were stories of military life; among them may be mentioned, *O'Hara*, *Stories of Waterloo*, *The Dark Lady of Donna*, *The Bivouac and Rambling Recollections of a Soldier of Fortune*. He wrote also a life of the duke of Wellington, and contributed many papers in the *Dublin University Magazine* and *Bentley's Miscellany*. "Christopher North" spoke of Maxwell in the *Noctes* as a true sportsman, and successful in "many picturesque descriptions of the wildest scenery in Connaught, many amusing and interesting tales and legends, and much good painting of Irish character."

MAXWELL, Sir WILLIAM STIRLING, LL.D., b. near Glasgow, Scotland, in 1818; bore the name of Stirling until 1866, when by the death of sir John Maxwell, his maternal uncle, he succeeded to a baronetcy and assumed the name of Maxwell. He graduated at Cambridge in 1839, after which he visited Spain and France, devoting several years to studies of the history, literature, and art of Spain at the close of the mediæval period. Among his works are *Annals of the Artists of Spain; Cloister Life of Charles V.*, and *Velasquez and his Works*. He was elected to parliament for Perthshire in 1852, and represented that borough most of the time for a period of more than 20 years. He was rector of the university of St. Andrews in 1863, and of that of Edinburgh in 1872, and in 1875 was elected chancellor of the university of Glasgow.

MAY [Lat. *Maius*, contracted from *Magius*, is from a root *mag*, or (Sans.) *mah*, to grow; so that May is just the season of growth], the fifth month of the year in our present calendar, consists of 31 days. The common notion that it was named Maius by the Romans in honor of Maia, the mother of Mercury, is quite erroneous, for the name was in use among them long before they knew anything either of Mercury or his mother. The outbreak into new life and beauty which marks nature at this time instinctively excites feelings of gladness and delight; hence it is not wonderful that the event should have at all times been celebrated. The first emotion is a desire to seize some part of that profusion of flower or blossom which spreads around us, to set it up in decorative fashion, pay it a sort of homage, and to let the pleasure it excites find expression in dance and song. Among the Romans the feeling of the time found vent in their *floralia*, or floral games, which began on the 28th of April, and lasted a few days. The 1st of May—MAY-DAY—was the chief festival both in ancient and more modern times. Among the old Celtic peoples a festival called *beltein* (q.v.) was also held on this day, but it does not seem to have been connected with flowers. In England, as we learn from Chaucer and other writers, it was customary, during the middle ages, for all, both high and low—even the court itself—to go out on the first May morning at an early hour "to fetch the flowers fresh." Hawthorn (q.v.) branches were also gathered; these were brought home about sunrise, with accompaniments of horn and tabor, and all possible signs of joy and merriment. The people then proceeded to decorate the doors and windows of their houses with the spoils. By a natural transition of ideas, they gave the hawthorn bloom the name of the "May;" they called the ceremony the bringing home the May;" they spoke of the expedition to the woods as "going a-Maying." The

fairest maid of the village was crowned with flowers as the "queen of the May;" placed in a little bower or arbor, where she sat in state, receiving the homage and admiration of the youthful revelers, who danced and sang around her. This custom of having a May queen looks like a relic of the old Roman celebration of the day when the goddess Flora was specially worshiped. How thoroughly recognized the custom had become in England may be illustrated by the fact that in the reign of Henry VIII. the heads of the corporation of London went out into the high grounds of Kent to gather the May—the king and his queen, Catharine of Aragon, coming from their palace of Greenwich, and meeting these respected dignitaries on Shooter's hill. But perhaps the most conspicuous feature of these festive proceedings was the erection in every town and village of a fixed pole—called the May-pole—as high as the mast of a vessel of 100 tons, on which, each May morning, they suspended wreaths of flowers, and round which the people danced in rings pretty nearly the whole day. A severe blow was given to these merry customs by the Puritans, who caused May-poles to be uprooted, and a stop put to all their jollities. They were, however, revived after the restoration, and held their ground for a long time; but they have now almost disappeared. In France and Germany too, May-poles were common, and in some places are still to be seen, and festive sports are even yet observed.—See Chambers's *Book of Days*, pp. 569–582, vol. i.

MAY, CAROLINE, b. England, 1820; daughter of the rev. Edward H. May, formerly pastor of the Dutch Reformed church in New York city. She published a volume of original *Poems* in 1864, and *Hymns on the Collects* in 1872. More important than her original work is the anthology which she published in 1848, under the title of *The American Female Poets;* to which are appended her own biographical and critical remarks. The work is written on much the same plan since followed by prof. J. S. Hart, and employed by Griswold in his compilation of a similar nature. Most of the names it contains have grown obscure, but the collection is still of some value to students of American literature.

MAY, SAMUEL JOSEPH, 1797–1871; b. Boston; graduated at Harvard in 1817; studied for the ministry with Henry Colman at Hingham, and with Henry Ware, Andrews Norton, and prof. Frisbie, at Cambridge; was ordained in the Chauncy Place church in Boston in 1822, and shortly afterwards settled as pastor of the Unitarian church in Brooklyn, Conn. When, in 1830, William Lloyd Garrison came to Boston to agitate the slavery question, Mr. May was there, and prominent among those who seconded his efforts. He joined the first society to promote the cause of immediate emancipation, and lived to witness the utter overthrow of slavery. When Prudence Crandall, a Quaker, was persecuted for opening her school for young ladies at Canterbury, Conn., to pupils of African lineage, he became her friend and adviser, and stood up bravely between her and her persecutors; and though he did not save the school from being finally broken up by violence, he did succeed in baffling the attempts to accomplish that result under the forms of law, and in arousing in that part of Connecticut a public sentiment against slavery that has never been overcome, and that for many years has determined the political status of the state itself. The late Arthur Tappan, of New York, furnished him with the funds necessary to prosecute a vigorous campaign for the defense of Prudence Crandall, and to establish a press for the enlightenment of the people. In 1834 Mr. May resigned his pastorate in Brooklyn to accept the position of general agent of the Massachusetts antislavery society. He was a public lecturer against slavery in the years 1835–36, when mobs were epidemic, and his life was often in great peril. His gentleness was as conspicuous as his courage, and he was never once betrayed into any harshness of spirit or language. Oct. 26, 1836, he was settled as pastor of the Unitarian church in South Scituate, Mass., where he remained until 1842, when, at the earnest solicitation of the late Horace Mann, then secretary of the state board of education, he took charge for three years of the normal school at Lexington. In 1845 he removed to Syracuse, N. Y., to become pastor of a Unitarian society, and there remained until his death. In that city he identified himself with the cause of education and with every institution of public charity, and was greatly beloved by the whole people. His house in Syracuse was a constant refuge for fugitive slaves, and he took an active part in the famous rescue of the slave "Jerry" from his legal captors at Syracuse in 1851. For this offense against the fugitive slave law he and 17 others were indicted in the U. S. district court at Auburn. A hundred of the best known citizens of Syracuse accompanied the prisoners to Auburn, and when they were required to give bail for their appearance for trial, William H. Seward was the first to affix his name to the bond, and he also invited the rescuers and their friends to his own house for refreshments. Mr. May and two other gentlemen united in a public declaration that they had "assisted all they could in the rescue of Jerry," that they were ready for trial, and would give the court no trouble as to the fact, but would rest their defense upon "the unconstitutionality and extreme wickedness of the fugitive slave law;" but the district attorney never brought them to trial. Mr. May, during the war, was constantly engaged in labors for the health and comfort of union soldiers, and when the struggle was ended he took an active part in associations for the relief of the freedmen. Many of his sermons and addresses were published, and a volume of his

Recollections of the Antislavery Conflict appeared before his death. His *Memoir* by Thomas J. Mumford was published in 1873.

MAY, THOMAS, an English historian and poet, 1595–1650; b. Sussex, Eng., of an ancient family; educated at Cambridge; repaired to London, became a member of Gray's Inn, and was admitted to the bar. He published the tragedies of *Antigone* and *Agrippina*, a comedy entitled *The Heir*, and other works. Some of his poems were published by special command of Charles I., with whom he was a favorite. Abandoning the court he became a republican. He was secretary to Cromwell during the civil war, and employed to write its history. This was published originally in Latin, and translated into English in 1650. He published two poems on the reigns of Henry II. and Edward III. He translated into English verse *Selected Epigrams of Martial*, Virgil's *Georgics*, and Lucan's *Pharsalia*, to the last of which he wrote a continuation in English and Latin. His *History of the English Parliament*, begun Nov., 1640, was edited by Baron Masères, and translated into French by Guizot. He was buried in Westminster abbey, but soon after the restoration his body was disinterred and thrown into a pit in the adjoining St. Margaret's churchyard. A monument which had been erected over his grave was demolished.

MAY, Sir THOMAS ERSKINE, b. England, 1815; educated at Bedford school, became assistant librarian of the house of commons in 1831, and entered the bar in 1838. In 1844 he published a treatise on the *Law, Privileges, Proceedings, and Usages of Parliament*, which has become a standard authority on parliamentary law. In 1846 he was made examiner of petitions for private bills, and the next year he was appointed taxing-master to the house of commons, of which he became clerk in 1871. In 1849, he published in pamphlet *Remarks and Suggestions with a View to Facilitate the Dispatch of Public Business in Parliament;* in 1850, another pamphlet, *On the Consolidation of the Election Laws*, and in 1861–63, *The Constitutional History of England since the Accession of George III.*, 1760–1860. This work is supplementary to Hallam's, and brings the constitutional history of England down to the present generation. It is a sound and trustworthy book, without special brilliancy. Sir Thomas published, in 1877, *Democracy in Europe—a History;* and he has contributed to the *Edinburgh Review* and the *Law Magazine*.

MÂYÂ is, in the Purânic mythology of the Hindus, the personified will or energy of the supreme being, who, by her, created the universe; and as, in this later doctrine, the world is unreal or illusory, Mâyâ assumes the character of illusion personified. In this sense, Mâyâ also occurs in the *later* Vedânta philosophy, and in some of the sectarian philosophies of India.

MAY'AS, a race of Indians found in the countries of Yucatan, Guatemala, and Tobasco, presenting a subject of interest as to their origin and habits, and their position as regards civilization. They differ decidedly, and in many respects, from other native races of that region. By some they are regarded as of wholly distinct origin; but by most ethnologists it is thought that they are descended from the ancient Toltecs, the builders of the extensive and grand structures whose ruins may be seen at Uxmal, Copan, Itza, and other sites in the neighborhood. The traditions of the Mayas indicate that they have occupied the country for from 600 to 800 years, and it is not improbable that the Toltecs may have merged with tribes immigrating from Cuba or the Antilles. The comparatively high degree of civilization is, doubtless, derived through the Toltec descent. Mayapan, the northern part of Yucatan, was in ancient times their chief home; and in that locality are the ruins of many noble cities. In their early history, though possessed of skill in architecture, with some knowledge of navigation and commerce, and though using an alphabet and written language, the Mayas were semi-barbarous in many respects, such as painting and tattooing the body and compressing the heads of their infants. After the Spanish invasion the Mayas were gained over to Christianity, after the usual fashion of the invaders, by fire and sword. Many of their savage customs were laid aside; but in 1848 occurred a most extensive uprising of the natives in many parts of Mexico, and the race regained its independence. Little communication has been held with them since, but it is said that they are once more lapsing into their old religion, which, like all those of Mexican origin, was founded on the basis of human sacrifice, and was blood-stained and revolting in the extreme. The ancient language and the alphabet of the Mayas have long been a subject of discussion by grammarians and students of comparative philology. The alphabet proper contains 29 characters, two or three forms being used for some of the English letters, while *d*, *f*, *g*, *q*, *r* and *v* are wanting; *s* and *z* are denoted by the same hieroglyphic, as are also *i* and *j*. There are in use, additionally, a set of marks indicating syllabic sounds. The manuscripts in existence are written upon bark, and the lines read from right to left. A number of grammars and dictionaries of the language exist, mostly in Spanish and French. The latest is that of Dr. Behrend (1875).

MAY-APPLE. See PODOPHYLLUM, *ante*.

MAYBOLE, a burgh of regality, in the county of Ayr, Scotland, 9 m. s. of the town of that name, and on the line of the Ayr and Girvan railway. Pop. '71, 3,797, who are

mostly shoemakers and weavers. In feudal times it was considered the capital of Carrick, and was the seat of the courts of justice of the Carrick bailiery. In the vicinity of Maybole are the ruins of the famous abbey of Crossraguel, the head of which, at the time of the reformation, was Quentin Kennedy, who held a public disputation with John Knox in a house at Maybole, which is still shown.

MAY BUG. See COCKCHAFER, *ante*.

MAYENCE. See MAINZ.

MAYENNE (Lat. *Meduana*), a river in the n.w. of France, which rises in the department of Orne, and after being joined on the right by the Varenne, Calmont, Ernée, and Oudon, and on the left by the Jouanne and Ouette, debouches at Pont de Cé, into the Loire, under the name of the Maine, having become navigable 50 m. s. of Mayenne.—This river gives its name to the department of MAYENNE, which has been formed from the western part of the old province of Maine and the n. of Anjou. Area, 1990 sq.m.; pop. '72, 350,637. Mayenne, which is included almost entirely within the basin of the Loire, has a mild climate, but only a partially productive soil, being occupied in many districts by extensive sandy heaths. The chief branches of industry are the breeding of cattle and sheep, and the rearing of bees; while the iron mines and marble quarries of the district yield employment to the poorer classes. The linen, hemp, and paper manufactures are of some importance. Mayenne is divided into the three arrondissements of Laval, Château-Gontier, and Mayenne.

MAYENNE, chief t. of the French department of the same name, is situated on the Loire, on the right bank of which rises, on a steep and rocky height, the ancient fortress of the dukes of Mayenne. Lat. 48° 14′ n., long. 0° 35′ west. The town is pleasantly situated, has several good squares, and some fine fountains; but it is specially remarkable for the extreme steepness of its narrow and winding streets. Manufactures of calico and linen. Pop. '76, 8,826.

MAYER, ALFRED MARSHALL, b. Baltimore, 1836; educated at St. Mary's college. In 1856 he was appointed professor of physics in the university of Maryland; and he has since held a similar position in the Westminster college in Missouri; in Pennsylvania college; in Lehigh university, and in the Stevens institute of technology, Hoboken, N. J., where he remains. He was for a time one of the editors of the *American Journal of Science and Arts*, and has published a number of contributions to science, of which may be noted: *Estimation of the Weights of very Small Portions of Matter*, 1858; *Researches in Electro-Magnetism*, 1873; and *Researches in Acoustics*, 1874. Since his connection with the Stevens institute, he has made a specialty of acoustics, in which he has made many interesting experiments, and some valuable discoveries. He has established the connection between the pitch and duration of a sound, has invented a method of determining the comparative intensity of sounds with the same pitch, and has located the organs of hearing in the mosquito. He has also developed new processes for analyzing sound, and has made researches into the nature of electricity.

MAYER, BRANTZ, 1809–79, b. Baltimore; educated at St. Mary's college, and after graduation, made a tour to the East. He returned to America in 1828, and was called to the bar, but gave up the practice of his profession in 1841, to become secretary of the American legation at Mexico. He came back in 1842 and for a time edited the Baltimore *American*. In 1867 he became a paymaster in the army. In 1844 he published the results of his observations in Mexico, under the name of *Mexico as it was and is*, describing the political and social state of Mexico at that time, with some account of the ancient Mexican civilization. To the latter branch of this subject, he returned in his *Mexico: Aztec, Spanish, and Republican*. This work, which appeared in 2 vols. in 1851, is of considerable value for the study of Mexican history after the Spanish conquest. In 1854 his *Captain Canot* came out, devoted to the exposure of the slave trade, and from its subject became highly popular. The Smithsonian institution published in 1856, his *Observations on Mexican History and Archæology*. He was one of the founders of the Maryland historical society.

MAYER, JOHANN TOBIAS, 1723–62, b. Würtemberg; son of a civil engineer, whose death left him dependent on his own exertions. He taught mathematics for a living, and devoted himself to the study of gunnery. In 1746 he assisted in founding the cosmographical society of Nuremberg, to whose *Transactions* he contributed a number of papers, among them an important paper on *The Libration of the Moon*, in which he made the first use of the equations of condition, which have since been so generally applied. In 1751 he was appointed director of the observatory of Göttingen, where for the remainder of his life, he did much to advance the sciences of astronomy and navigation. His first published work was *A Treatise on Curves for the Construction of Geometrical Problems*, which was followed the same year, 1745, by *A Mathematical Atlas*. At Göttingen, he gave much labor to a *Zodiacal Catalogue*, which contains 998 stars. His *Lunar Tables* were published in 1755, and were so correct as to be be adopted by the British board of admiralty. In the same year he dis-

covered the repeating circle, which was afterward used with so much success by Borda in measuring the arc of the meridian. He left a large number of scientific memoirs.

MAYER, JULIUS ROBERT, Dr., a German physicist, b. in Heilbroun, Würtemberg, 1814. He attended the gymnasium at Heilbroun, studied medicine at Tübingen, and finished his course at Munich and Paris. He made a voyage to Java in 1840, and while there he made observations on the blood which led him to the investigation of the subject of animal heat, and finally to that of the conservation and correlation of forces. After his return to Heilbroun he became town physician, which interrupted his investigations, but he published a preliminary notice of the work he had accomplished up to 1842, in Liebig's *Annalen der Chemie und Pharmacie* under the title *Bemerkungen über die Kräfte der unbelebten Natur*. In 1845, he made a fuller explanation of the subject in a memoir, under the title, *Die organische Bewegung in ihrem Zusammenhange mit dem Stoffwechsel*. In 1848 he published *Beitrage zur Dynamie des Himmels*, and in 1851 the essay for which he is perhaps more generally known in popular science, that upon the mechanical equivalent of heat, in which he developed and expanded the principles laid down in his former papers. His argument is that the sun's power is the source of all energy on the earth, nature storing up the light and heat, and molding it into permanent forms, from which other kinds of energy may be derived. In this way various potential conditions are formed, plants storing up power to be afterward transferred to animals and diffused in motion or work; or the plants in the form of wood and coal may liberate their forces by combustion. He determined the numerical relation between heat and work, and followed up his investigation by considering the vast amount of heat generated by gravity when the force continues its action through sufficient space; concluding that the gravitating force between the sun and the earth possessed a heat equivalent to a mass of 6,000 times the weight of the earth, and that the light and heat of the sun are maintained by the constant impact of meteoric matter. In 1848 Dr. Mayer incurred the displeasure of many of his former friends by taking sides against the revolutionists, and the attacks made upon his scientific investigations so affected him as to throw him into a sleepless condition which resulted in delirium, during which he leaped from a window 30 ft. high, sustaining severe injuries, from which, however, after a long time he recovered. His works have been published under the title *Die Mechanik der Wärme*, (Stuttgart, 1867). The Copley medal was awarded to him by the royal society of London in 1871.

MAYER, KARL, 1799–1862, b. Germany; a voluminous composer for the piano. He went to Russia with his father, who was a member of a regimental band, in 1812. While at Moscow he was a pupil of the pianist John Field. After a residence in Paris and Brussels, and a tour through Germany, he went back to Russia, where he won a high reputation as a teacher of the piano. He gave lessons at St. Petersburg and Moscow, but finally made his home in Dresden, where he died. He left 351 compositions for the piano, of which the more pretentious are concertos for the piano and orchestra.

MAY-FLY. See EPHEMERA.

MAY'HEM. See BEATING AND WOUNDING, *ante*.

MAYHEW, EXPERIENCE, 1673–1758, b. Martha's Vineyard. He was the oldest son of Rev. John Mayhew, and great-grandson of Gov. Thomas Mayhew. He began to preach to the Indians at the age of twenty-one, in 1694, and had the oversight of five or six Indian assemblies, which he continued for 64 years. Though not favored with a learned education, he became so conspicuous that Dr. Cotton Mather in a sermon printed at Boston in 1698, and reprinted in his *Magnalia*, London, speaking of more than "thirty hundred Christian Indians," and "thirty Indian assemblies," adds: "A hopeful and worthy young man, Mr. Experience Mayhew, must now have the justice done him of this character, that in the evangelical service among the Indians there is no man that exceeds this Mr. Mayhew, if there be any that equals him." Having thoroughly mastered the Indian language, which he had learned in infancy, he was employed by the commissioners to make a new version of the Psalms and the gospel of John, which he did in 1709 in collateral columns of English and Indian. He was offered the degree of master of arts at Cambridge, which, though he declined, was conferred upon him at the public commencement, July 3, 1723. He published in 1727 *Indian Converts*, comprising the lives of 30 Indian preachers and 80 other converts, besides a volume entitled *Grace Defended*.

MAYHEW, HENRY, 1812–76, b. London; son of a solicitor in good practice. Was sent to Westminster school, but twice ran away, and made a voyage to Calcutta on a ship-of-war. On his return to London he passed three years in his father's law office as an articled clerk, traveled for a period in Wales, and finally adopted the literary profession and settled in London. His first venture was theatrical. In company with Mr. Gilbert à Beckett he took the Queen's theater, where he produced the clever farce of *The Wandering Minstrel*. About the same time he started a comic paper called *Figaro in London*, which was the precursor of *Punch*, of which Mr. Mayhew was also one of the founders. Between the years 1846–51, in conjunction with his brothers, Horace and Augustus, he brought out a number of fairy tales and farces, and a series of humorous sketches, including *The Greatest Plague of Life; Whom to Marry, and How to Get Mar*

ried; *The Image of his Father;* etc. He also published individually *Young Benjamin Franklin; Boyhood of Martin Luther; The Wonders of Science;* and other books for children. In 1851 he produced his most important work, *London Labor and the London Poor, a Cyclopædia of the Condition and Earnings of those that will Work, those that cannot Work, and those that will not Work.* Of this book Mr. Henry T. Tuckerman wrote as follows: "Mayhew has given us the diagnosis of London street life with an analytical precision quite scientific. . . . . A body of the most curious information is brought together, which reveals a world of facts appalling to the sensibilities, and wonderfully suggestive to the political economist." Mr. Mayhew also commenced the publication in numbers of a similar work entitled *The Great World of London,* which was not completed. The first of these works was begun in the London *Morning Chronicle;* it was published in 3 vols., 1861, and reprinted 1868. The versatility of Mr. Mayhew's talent is shown by the widely differing nature of his various works. The London *Athenæum* said of him: "We have long been in want of a 'young people's author,' and we seem to have the right man in the right place in the person of Mr. Mayhew." Another London journal, referring to one of his biographical stories for boys, said that it was "told with the grace and feeling of Goldsmith, and by one who has that knowledge of science which Goldsmith lacked."

MAYHEW, Ira, b. New York, 1814; received an education and went west in early youth, and settling in Michigan became a successful teacher. He was for some years superintendent of schools for the state of Michigan. In 1849 the legislature of Michigan passed a resolve in favor of the publication of a *Treatise on Popular Education* for the use of parents and teachers, which was written by him, considered satisfactory, and is now the sixth volume of A. S. Barnes & Co.'s school-teachers' library, New York. He has published *Practical System of Book-keeping,* and *Universal Book-keeping.* His work is characterized as an efficient help to the cause of popular education which has received merited recognition.

MAYHEW, Jonathan, 1720–66, b. Martha's Vineyard, Mass.; graduated at Harvard college in 1744; ordained minister of the West church, Boston, in 1747, which place he occupied until his death. He took a decided stand against the introduction of bishops into the colonies by the Gospel propagation society, which led to a controversy with Dr. Apthorp and the bishop of Canterbury. He took sides, too, with the opponents of the arbitrary policy of England toward the colonies, boldly expressing his views even in the pulpit. His published works are a volume of seven sermons: *Christian Sobriety, in Eight Sermons to Young Men; Observations on the Charter and Conduct of the Society for Propagating the Gospel in Foreign Parts.* A memoir of him was published by Alden Bradford.

MAYHEW, Thomas, 1592–1682, b. England; was a merchant in Southampton; emigrated to America in 1631, and settled in Watertown in 1636, obtained in 1641 from the agent of lord Sterling a grant of Martha's Vineyard and the neighboring islands, about 50 m. from Plymouth rock. In 1642 he became both patentee and governor of Martha's Vineyard and other islands. His son having been called to labor in the ministry at Edgartown, governor Mayhew encouraged his work, both by his advice and by inducing the Indian sachems to govern their people according to English laws. They "loved and admired him as the most superior person they had ever seen." They drew up a writing in their own language, signed by men "of the greatest note and power," declaring that as they had freely submitted to the crown of England, so they resolved to assist the English on the islands against their enemies. For 40 years while he lived among them the English and Indians were at peace. While governor he also preached, walking sometimes, even in his old age, 20 m. through the woods. When above fourscore years of age they urged him to accept the pastoral charge of them, which, however, he declined on account of his position as governor. He continued to preach to extreme old age.

MAYHEW, Thomas, 1621–57; the only son of governor Thomas Mayhew; b. England; received a liberal education; removed with his father to Martha's Vineyard in 1642; was called by the settlers on the new plantation to the ministry among them. Soon learned the Indian language, and began to preach among them. In 1651 there were 199 men, women, and children who professed to be worshipers of the true God. Desiring to give a more detailed account of the Indians than he could by letter, and to secure aid in his work, he embarked in 1657 for England with his brother-in-law and an Indian preacher, but nothing was ever again heard of the ship. He was an earnest and successful minister, greatly beloved and esteemed by the Indians.

MAYHEW, Thomas, b. London, 1810; brother of Henry and Horace; entered the profession of literature, and particularly distinguished himself by becoming a pioneer in the production of cheap reading matter for the poorer classes. He published a number of works sold for a penny; including dictionaries and grammars, and founded the penny national library.

MAYMEMÉ, or Maimenah, a city in independent Turkestan, about half way between Balkh and Herat, on a river flowing n. towards the Jihun. It consists of about 1500 mud huts, a frail bazaar built of brick, three mosques of mud, and two *medresse,* or

colleges, of brick. It is considered by the natives to be a powerful stronghold, but its only defenses are a simple wall of earth around the city, 20 ft. high; and a citadel surrounded by a fosse, and situated upon a conspicuous hill of steep ascent. The people of the town, as well as those of the khanat, are bold and fearless riders, and of resolute, warlike character.

MAYNADIER, WILLIAM, 1806–71; b. Md., a graduate of West Point military academy; in 1827 was appointed brevet 2d. lieut. of artillery. He was at one time adjutant of the artillery school of practice at fort Monroe, having been previously assigned to duty there. In 1832 he was one of gen. Winfield Scott's aids in the Black Hawk war in Illinois, and in 1835–38 served in the same capacity with gen. Macomb in the Seminole war, a contest between the Indians and settlers in Florida. In 1838 he was appointed capt. and acting inspector of ordnance, and placed on duty at the U. S. arsenal in Pikesville, Md. In 1842 he was promoted to assistant chief of ordnance, holding the position for several successive years, and was gradually advanced from maj. in 1861, to brevet brig.gen. in 1865. He was remarkable for fine abilities rendered useful by a varied experience, for sound judgment and careful discrimination.

MAYNARD, HORACE, b. Mass, 1814; educated at Amherst college. Removed to Tennessee, and held the position of tutor, and afterwards that of professor of mathematics in the East Tennessee university. In 1844 he was admitted to the bar, and entered upon a law practice which became lucrative and important. He was a member of congress from 1857 to 1863, and during the rebellion suffered from serious losses of property. He was again elected to congress in 1866, and continued to represent the Knoxville, Tenn., district until 1873, and afterwards for two years was representative at large. He was appointed minister to Constantinople in 1875 and continued there until 1880, being appointed postmaster-general in August of the latter year.

MAYNARD, Sir JOHN, 1602–90; b. at Tavistock, England; educated at Exeter college, Oxford. After the regular course of study in the Middle Temple he was called to the bar, having been made a member of parliament in the previous year, 1625. He was subsequently made a sergeant-at-law and king's sergeant, but declined the place on the bench offered him by Charles II. in 1660. In a long political career, extending over 65 years, sir John was a witness of and prominent actor in the most eventful crises of English history. An urgent advocate of increasing the power of the people, he never concurred in the extreme views taken by the radical republicans; an earnest Presbyterian, he stood aloof from the absurd fanaticism of many in his party. He was active in the prosecution of Strafford and Laud, but strongly opposed the arbitrary power assumed by the army, and Cromwell's evident intention of making himself king in fact, if not in name; and for the position he took in this respect was twice imprisoned by order of the protector in the tower of London. At the restoration the honor of knighthood was conferred upon him by Charles II.; and his political course under that monarch was judicious and conservative. In the time of the revolution and the accession of William and Mary, he showed great ability, and notably in the great conference held between the house of lords and the commons in regard to the abdication of James II., a measure which he strenuously advocated. In the same year, 1689, he was made a commissioner of the great seal. Macaulay relates that when, at an interview with William III., the king remarked to Maynard that he must have outlived all the lawyers of his time, sir John both wittily and truthfully replied, "Yes; and if your highness had not come to our assistance, I should have outlived the law, also." Both as a statesman and as a lawyer and expounder of the true principles of the British constitution, Maynard occupied a very high position among the many remarkable men of his age. A number of his political speeches and legal decisions have been collected and published.

MAYNOOTH, a village of the co. Kildare, Ireland, 15 m. n.w. from Dublin by the Midland Great Western railway; pop., including the college, '71, 2,091. It is of some historical interest as the seat of the powerful family of the Geraldines, of whose castle large and very striking ruins still remain; and as the scene of more than one struggle with the English power, especially the "rebellion of Silken Thomas," in the reign of Henry VIII., and in the war of the confederates (1641–50). But its chief modern interest arises from the well-known Roman Catholic college, which supplied for many years material for strife to the zealots of the rival religious parties in Great Britain. This college was established during the ministry of Mr. Pitt, in the year 1795, by an act of the Irish parliament, in order to meet a necessity created by the utter destruction, through the French revolution, of the places of education in France upon which the Irish Catholic clergy, excluded by the penal laws from the opportunity of domestic education, had hitherto been driven to rely. The original endowment, an annual vote of £8,928, was continued, although not without sustained opposition, by the imperial parliament after the act of union. In the year 1846 sir Robert Peel carried a bill for a permanent endowment of £26,000 a year, to which was added a grant of £30,000 for building purposes. The building erected under the original endowment is a plain quadrangle. The new college is a very striking Gothic quadrangle by Pugin, containing professors' and students' apartments, lecture-halls, and a singularly fine library and refectory. Pugin's design included a chapel and common-hall, which, owing to insufficiency of funds, have been postponed. Under the act of 1845 the college was to receive 500 students, all

destined for the priesthood. The patronage of the 500 studentships was divided in the ratio of population among the bishops of the several sees of Ireland; but the candidates thus named were subjected, before matriculation, to examination in a comprehensive entrance course. The full collegiate course was of 8 years, 2 of which were given to classics, 2 to philosophy, and the remaining 4 to the more directly professional studies of divinity, scripture, church history, canon law, and the Hebrew and Irish languages. The divinity students, 250 in number, received a money stipend of £20 annually; and at the close of the ordinary course, 20 scholarships, called from the founder, lord Dunboyne, "Dunboyne scholarships," were assigned by competition to the most distinguished students, and might be held for 3 years. The legislative authority was vested in a board of 17 trustees, and the internal administration in an academical body, consisting of a president and vice-president, together with a numerous body of professors and deans. A visitorial power was vested in a board of 8 visitors, of whom 5 were named by the crown, and 3 elected by the trustees. In 1869, by the Irish church act (32 and 33 Vict. c. 38–41), the Maynooth endowment was withdrawn—a capital sum, 14 times its amount, being granted to the trustees for the discharge of existing interests. The college, however, is still maintained on the same footing. The educational arrangements are unaltered, and although the number of pupils, owing to the suspension of free studentships and exhibitions, has somewhat fallen off, the diminution is regarded as temporary. The visitorial powers created under the act of parliament are now exercised by visitors appointed by the trustees, and all state connection is at an end. The college also possesses some landed and funded property, the result of donations and bequests, the most considerable of which is that of lord Dunboyne, Roman Catholic bishop of Cork, who had for a time conformed to the Protestant faith. A great part of the college buildings was burned in Nov., 1878.

MA'YO, a maritime county of the province of Connaught, Ireland, is bounded on the n. and w. by the Atlantic ocean, e. by Sligo and Roscommon, and s. by Galway. Area, 1,363,882 acres, of which 497,587 are arable; population, which in 1861 was 254,449, had fallen in 1871 to 246,030, of whom 238,319 were Roman Catholics, 6,096 Protestant Episcopalians, and the rest Protestants of other denominations. The coast-line of Mayo is about 250 miles. The surface is very irregular, the interior being a plain bordered by two ranges of mountains. Of these ranges, the highest points are Croagh Patrick, 2,610 ft., and Nephin, 2,646 ft. in height. The soil of the plain is fertile, and for the most part suitable either for tillage or for pasture, although the prevalence of rain and ungenial winds render tillage, especially of wheat and potatoes, precarious and unremunerative. The number of acres under crop in 1878 was 192,021. The rearing of cattle forms in most parts of the county the more ordinary pursuit of the agricultural population. In 1875 the number of cattle was 174,614; sheep, 300,328; and of pigs, 53,661. Ironstone abounds in some districts, but, owing to want of fuel, no attempt is made to work it. An excellent marble is found in the north-western district, and there are several places in which slates are successfully quarried. The chief towns are Castlebar, Westport, Ballina, and Ballinrobe. Almost the only occupations of the population are agriculture and fishing. A valuable salmon-fishery exists in the river Moy; and the small lake of Lough Mask is the habitation of the well-known "gillaroo" trout. The Irish language is still spoken in a large part of Mayo. The number of pupils attending school during 1875 was 50,173—an increase of nearly 10,000 since 1871.

Mayo formed part of the extensive territory granted by Henry II. to William de Burgho; but in the middle of the 14th c. one of the younger branches of the family, seizing on the counties of Galway and Mayo, threw off the English allegiance, adopted the "customs of the Irishry," together with the Celtic name of MacWilliam. In the year 1575 the MacWilliam made his submission at Galway; but having subsequently revolted, the district was finally subdued by sir Richard Bingham in 1586. The antiquities of Mayo are chiefly ecclesiastical. Four round towers are still in existence, and there are at Cong the remains of a splendid abbey, which dates from the 12th century. The celebrated "Cross of Cong," now in the museum of the royal Irish academy, was the archiepiscopal crosier of Tuam, once preserved in the abbey of that name.

MAYO, Amory Dwight. b. in Warwick, Franklin co., Mass., Jan. 31, 1823; educated at Amherst college; studied theology with the rev. Hosea Ballou, formerly president of Tufts college; from 1846 to 1854 was pastor of a Universalist church in Gloucester, Mass.; from 1854 to 1856 preached in Cleveland, O.; from 1856 to 1863 in Albany, N. Y.; and from 1863 to 1872 in the church of the Redeemer (Unitarian), in Cincinnati, O.; and from 1872 to 1880 was pastor of the Unitarian church in Springfield, Mass. During his whole public life he has been an earnest advocate of popular education, and has written much upon the subject. He has opposed with zeal the effort to secularize the public schools, contending for the use in them of the Bible as a means of moral instruction. He has also taken a decided stand in favor of the so-called "Christian amendment" to the constitution of the United States. For several years he was professor of ecclesiastical polity in the Meadville (Penn.) theological school, visiting the institution yearly to deliver the necessary lectures. He is at present the editor of the *Massachusetts Journal of Education*, and engaged besides in general labors throughout

the country to stimulate popular interest in the school-system. His published works are *The Balance; Memoirs of Mrs. S. C. E. Mayo*, his first wife; *Graces and Powers of the Christian Life;* and *Symbols of the Capital*, a volume of sermons on the elements of Christian civilization.

MAYO, RICHARD SOUTHWELL BOURKE, Earl of, 1822–72; b. Dublin, Ireland; educated at Trinity college in that city. He was the sixth earl of Mayo, and, until his succession to the title at his father's death in 1867, was known as lord Naas. After graduation he traveled in Russia, and published an account of the trip in *St. Petersburgh and Moscow* (1845). His career in politics was most successful; he was twice returned to parliament, and was made chief secretary for Ireland in 1852 by lord Derby, and again in 1858, and 1866, when that statesman was in power, was reappointed to the same position; and under Disraeli's administration was in 1868 made viceroy of India. Here he at once introduced extensive reforms in the conduct of the public service. To this matter he gave his most earnest attention, and it was while engaged in an examination of the penal settlement at fort Blair among the Andeman islands that he met his death at the hands of one of the convicts. It is generally believed that the act was prompted only by natural malignity, and was not occasioned by any political cause.

MAYO, WILLIAM STARBUCK; b. at Ogdensburg, N. Y., 1812; educated as a physician, and took his degree at the New York college of physicians and surgeons in 1833. Dr. Mayo is chiefly known as a traveler and writer of fiction. He spent some time in Spain and in Morocco and other parts of North Africa; and the experience and information gained in these travels was employed with effect in his earlier novels. In fiction he has written *Kaloolah* (1849); *The Berber, or Mountaineers of the Atlas* (1850); *Romance Dust from the Historic Placer* (1857); and *Never Again* (1873). Of these, the first was the most popular, and obtained a very large circulation. His books abound in incidents of adventure and perils, and show versatility, but his character portrayal is, with one or two exceptions, inferior to his narrative. His style does not avoid extravagance; and sometimes, as in his last book, is somewhat morbid. His work, however, is interesting, and has not failed of readers.

MAYOR (Fr. *maire*, Lat. *major;* see MAOR), originally a steward, bailiff, or overseer, thence the chief magistrate of a city or corporate town in England or Ireland. The mayor is the head of the local judicature, and the executive officer of the municipality; he is elected by the council from the aldermen or councilors, and holds office for a year only. His duties include those of returning officer in all burghs except those cities and towns which, being counties of themselves, have sheriffs of their own. The first mayor of London was appointed in 1189, the first mayor of Dublin in 1409. The mayors of London, York, and Dublin are called "lord mayor." The lord mayor of London has the title of "right honorable," which, along with the title "lord," was first allowed by Edward III. in 1354; is the representative of royalty in the civil government of the city, the chief commissioner of lieutenancy, the conservator of the river Thames; and on the demise of a sovereign, he becomes, *pro tempore*, a member of the privy council. To sustain the hospitality of the city, he receives an allowance of £8,000 a year, with the use of the Mansion-house, furniture, carriages, etc. He is chosen by the livery (q.v.) on Sept. 29, being commonly the senior alderman, who has been sheriff, but not lord mayor. In former times, it was the ambition of the first merchants and bankers of the city to become lord mayor; but since the district within the metropolitan boundaries has come to be but a small fraction of what is generally known as London, this has ceased to be the case; and it is only in the eye of foreigners that the lord mayor of London is one of the most important public functionaries of the realm. The mayor of Dublin was first styled lord mayor by Charles II. in 1665.

MAYOR, *ante*, the ordinary name for the chief executive officer of an incorporated city. No general definition of his powers can be given. They are defined by the charter of the particular city where he holds office, and, as in the case of New York city, are subject to almost annual changes by the legislature. In some cities the mayor actually has great authority; in others, his powers are divided among executive boards or commissions, or he is made dependent for confirmation of his acts or appointments upon the consent of aldermen, or the common council, or other elective or appointive bodies, so that the mayor's actual powers are often extremely limited.

MAYOR, JOHN EYTON BICKERSTETH; b. Ceylon, 1825; educated at Shrewsbury school, and St. John's college, Cambridge, of which he became fellow in 1849. He was assistant master of Marlborough college from 1849 to 1853, took orders in the church in 1855, and in 1863 became librarian of the university of Cambridge, where, since 1872, he has been professor of Latin. His services to the study of classical literature and philology have been eminent, and the number of his works, and particularly of his editions of classical authors, is large. He published an edition of the satires of Juvenal in 1853, and a new edition of the same work appeared in 1878. He has edited the works of Quintilian, the *Speculum Historiale* of Richard of Circencester, the *Second Philippic* of Cicero, and a portion of Homer's *Odyssey*. He has also published a number of school text-books, and *A Bibliographical Clue to Latin Literature*. He has been an associate editor of the *Journal of Classical and Sacred Philology*, and of the *Journal of Philology*.

MAYOR'GA, MARTIN DE, a Viceroy of Mexico. When he arrived in the country the small-pox was raging with great violence, and in a few days 8,000 persons died. He ordered a general inoculation of the people. He was a man of energy, and much interested in the welfare of the people, but his wise and useful measures were greatly hindered and opposed. He founded an academy of arts in Mexico. During his administration gold and silver to the amount of nearly $75,000,000 were coined. He died from poison on his way to Spain. He was the 47th viceroy of Mexico.

MAYOR OF THE PALACE, originally the title of the royal steward under the Merovingian kings. His proper function was the administration of the royal estates, and the care of the royal household; but by 650 the entire administration of the government had passed into the hands of the mayors of the palace. Grimoald of Austrasia, and Ebroin of Burgundy, exercised an absolute authority in their office as mayors. The most famous of the mayors of the palace, Pepin of Héristal, who held the office 688–714, and his son, Charles Martel, who died in 741, were kings in everything but name; and Charles Martel's son, Pepin the short, took the title of king. Thenceforward the office lost much of its importance.

MAYOTTA, one of the Comoro isles (q.v.), ceded to France in 1843, lies in lat. 12° 34′ to 13° 4′ s., and long. 44° 59′ 15″ to 45° 23′ east. It is of irregular form and measures 21 m. from n. to s., with an average breath of 6 or 7 m.: if, however, the dangerous coral reefs which surround the island be included, the whole occupies a space of 30 m. n. and s., and 24 m. e. and west. The surface of Mayotta is very uneven, and is studded with volcanic-looking peaks, some of which exceed 2,000 ft. in height. The shores of the island are in some places lined with mangrove swamps, which are uncovered at low water and are productive of malaria and fever. The island is in most parts capable of cultivation, and contains several sugar plantations. There are produced annually from 40,000 to 50,000 cwts. of sugar; and the total exports for a year are valued at nearly £50,000. It is principally sugar that is exported; and the supply of food grown on the island is insufficient for the use of the inhabitants. The total imports in a year do not exceed in value £25,000. As a colony Mayotta has certainly not fulfilled the expectations entertained by the French at the time of its occupation, notwithstanding the unusually liberal terms held out to the colonists. The French establishment is on the island of Zaondzi, inside the chain of reefs on the e. side of Mayotta, and consists of a governor, colonial officer, some artificers and seamen, and about 100 soldiers, besides a few native ones. There are several substantial government buildings and store-houses; there is a good roadstead, and the fort has been recently strengthened. Mayotta is the only refuge for French ships in the Indian ocean. It is the principal market for the neighboring islands. Pop. '75, 10,875.

MAYOW or MAYO, JOHN, LL.D., 1645–79; b. Cornwall, England; educated at the university of Oxford, and studied both law and medicine, but his taste was for philosophical and chemical investigation; and, though he acquired some celebrity in his profession, both in his practice at Bath and as a medical writer, he is chiefly remarkable for his discoveries and speculations in certain chemical subjects and especially as regards the nature of the process of combustion and chemical affinities. As regards these subjects, he seems to have been far in advance of the scientific theories of his time, and to some extent to have anticipated the discoveries of Priestly and others of the following century. His pamphlet, *De Sale Nitro et Spiritu Nitro-æereo* (1674), maintains that atmospheric air undergoes change in its composition during the combustion of fuel. A collection of his writing, *Opera Omnia Medica Physica*, was published in 1681. He died when only 34 years of age.

MAYSVILLE, a city of Kentucky, United States of America, on the Ohio river, 63 m. s.e. of Cincinnati. It is finely situated, is the river-port of a rich territory, and one of the largest hemp-marts in America. It has extensive manufactories of cotton, hemp, tobacco, iron, and coal-oil. It contains the county buildings, city hall; market, 3 banks, 12 churches. Pop. '70, 4,705.

MAYWEED, *Maruta colula*, a common road-side plant, growing also in pastures and meadows, belonging to the order *compositæ*. It is a native of Europe, but although widely spread in America, it is not an aggressive weed. The flower has somewhat the appearance of chamomile, and is sometimes called stinking chamomile. It has been classed as *anthemis*, and the two genera are much alike.

MAZAMET, a t. of France, dep. of Tarn, 43 m. e.s.e. of Toulouse, on the Arnette, a feeder of the Tarn. It has extensive woolen manufactures and cloth-fairs. Pop. '72, 10,500.

MAZANDERAN, a province of Persia, bounded on the n. by the Caspian sea. It consists for the most part of a tract of low coast-land, about 200 m. in length by 50 in breadth. Along the shore of the Caspian the land is marshy, but further inland the surface becomes elevated. The climate cannot be called salubrious, although it is more healthy than that of the neighboring province of Ghilan. The soil is fertile; rice, cotton, mulberry, sugar-cane, and a variety of fruits are produced. It exports silk, cotton, and rice to Russia, and imports woolen goods, cutlery, tobacco, etc. Throughout the whole province, parallel with the shores of the Caspian, extends a causeway, constructed by

Shah Abbas the great in the 17th c., and still in good repair. Pop. about 150,000; capital, Sari (q.v.).

MAZARIN, JULES (Ital. *Giulio Mazarini*), cardinal and chief minister of France during the minority of Louis XIV., was born July 14, 1602, at Rome, or, some say, at Piscina in the Abruzzi. The social position and occupation of his father are points in dispute. Mazarin studied law at Rome and at the Spanish universities, where he contrived to unite industry with amorous gayety. Afterwards he entered the pope's military service, perhaps about 1624. Having accompanied a papal legate to the court of France, he became known to Richelieu about 1628, who perceived his great political talents, and engaged him to maintain the French interests in Italy, which he did while still employed by the pope as vice-legate to Avignon (1632) and nuncio to the French court, an office to which he was appointed in 1634. The Spaniards complained of his partiality for France, and the pope was obliged to recall him. The subtle Italian was not thus to be check-mated. In 1639 he openly entered the service of Louis XIII., and was naturalized a Frenchman; and in 1641 received a cardinal's hat, through the influence of Richelieu, who, when dying, recommended Mazarin to the king as the only person capable of carrying on his political system. Mazarin's position was one of great difficulty amidst the intrigues, jealousies, and strifes of the earlier years of Louis XIV.'s minority. The queen-mother, Anne of Austria, was at first particularly hostile to him; but although she was declared sole regent and guardian of the young king, Mazarin kept his place as minister, and soon made himself indispensable to her, partly by his wonderful business qualities, and still more by the exquisite charm of his manner, so that, although with greater smoothness, he ruled with almost as unlimited a sway as Richelieu. The parliament, thinking to regain political power, resisted the registration of edicts of taxation; but Mazarin caused the leaders of the opposition to be arrested, upon which the disturbances of the Fronde (q.v.) began. The court retired to St. Germain; Mazarin was outlawed by the parliament; but by the truce of Ruel he still remained minister The feeling against him, however, became still more inflamed when, at his instigation, the queen-regent caused the princes of Condé and Conti and the duke of Longueville to be arrested in Jan., 1650. Mazarin went in person at the head of the court troops to the insurgent provinces; and after the victory at Réthel showed so much insolence that the nobles and the people of the capital made common cause against him, and he thought it necessary to secure his safety by flight to the Netherlands, whilst the press teemed with violent publications against him, known as *Mazarinades*. After the rebellion of the prince of Condé he ventured to return to France; but Paris making his removal a condition of its submission, he retired again from the court, and it was not till Feb. 3, 1653, that he made a triumphant entry into the capital, where he was received with significant silence. Yet in a short time he was popular, and had acquired his former power. Under him the influence of France amongst the nations was increased, and in the internal government of the country those principles of despotism were established on which Louis XIV. afterwards acted. The administration of justice, however, became very corrupt, and the commerce and finances of the country sunk into deep depression. It is admitted that as a financial administrator he was far inferior to Richelieu. Mazarin died at Vincennes, March 9, 1661. He was very niggardly and very avaricious, and had acquired in various ways, fair and foul, an immense fortune, amounting to 12,000,000 livres, which he offered to the king shortly before he died, afraid, it is thought, that it might be rudely seized from his heirs. Louis declined the restitution, which was perhaps what the wily minister expected. He was privately married to Anne of Austria. See the *Memoirs* of Mazarin's contemporaries, Retz, Mme. Motteville, La Rochefoucault, Turenne, Grammont, etc.; *Siècle de Louis XIV.*, by Voltaire; *Mme. de Longueville*, etc., by Victor Cousin; and A. Renée's *Les Nièces de Mazarin*.

MAZARRE'DO Y SALAZOR, JOSÉ MARIA, Admiral, 1744–1812; b. at Bilbao, Spain; entered the navy in 1760; participated in the campaign against Algiers in 1775, and was the means of saving the remnant of the army from destruction. He negotiated peace with the regency, was made maj.gen. of naval forces, and took part in the naval operations against the British in 1780–83. He was promoted to the rank of lieut.gen. in 1789, and to that of commander-in-chief in 1793, and defended Cadiz against the British in 1797. He served as ambassador to Paris in 1799 and 1804; was a zealous supporter of Joseph Bonaparte, who made him counselor of state and minister of marine, which offices he held to the close of his life. As a scientific seaman his rank was high. He built the naval observatory at Cadiz, and published *Rudimentos de Tactica Naval*.

MAZAR'RON, or ALMAZARRON, a sea-port t. of Spain, in the province of Murcia, 27 m. w.s.w. of Cartagena, on the coast of the Mediterranean. The inhabitants are employed in fishing and mining—silver ores and alum being found in the neighboring hills. Much borilla is made here. From the number of ruins found in the vicinity, this is supposed to have been the site of an important Carthaginian settlement. Pop. about 7,000.

MAZATLAN, a sea-port of Mexico, at the mouth of a river of its own name, which falls into the entrance of the gulf of California, lat. 23° 10′ n., long. 106° 21′ w. It is a well-built and picturesque town. The climate is healthy, but very hot (85° to 105° in the shade during August). Pop. from 12,000 to 15,000—a mixed race of old Aztec Mexicans, Indians, Spaniards, and negroes. The chief exports to California and Europe

are silver dollars, Brazil or Lima wood, and copper; imports, provisions, machinery, British hardware and crockery, and dry goods from France and Germany. In 1864 the town was besieged by the French and imperial troops. The harbor of Mazatlan, though much exposed to winds from the s.w., is the most important on the Mexican coast.

MAZDAK, a Persian religious enthusiast and founder of a sect; b. at Persepolis, A.D. 470. He became a priest at Nishapur. Professing himself a prophet sent to regenerate mankind, he obtained many followers, and declared a community of property. He succeeded in converting the king, Kobâd, and his system of communism made great changes in the social order. But the revolution was temporary. He was put to death with thousands of his followers between 530 and 540.

MAZEPPA, JAN "JOHN", hetman of the Cossacks, was b. about 1645, and was descended of a poor but noble family of Podolia. He became a page in the service of John Casimir, king of Poland. A Polish nobleman, having surprised him in an intrigue with his wife, caused him to be stripped naked, and bound upon his own horse, lying upon his back, and with his head to its tail, and sent the animal off, leaving Mazeppa to his fate. The horse carried him to his own distant residence—not to the Ukraine, as has been often said; but Mazeppa, out of shame, fled to the Ukraine, joined the Cossacks, and by his strength, courage, and activity rose to high distinction amongst them, and in 1687 was elected their hetman. He won the confidence of Peter the great, who loaded him with honors, and made him prince of the Ukraine; but on the curtailment of the freedom of the Cossacks by Russia, Mazeppa conceived the idea of throwing off the sovereignty of the czar, and for this purpose entered into negotiations with Charles XII. of Sweden. These and other treasons were revealed to Peter the great, who did not credit the informants; but afterwards, being convinced of Mazeppa's guilt, caused a number of his accomplices to be put to death. Mazeppa joined Charles XII., and took part in the battle of Pultowa, after which he fled, in 1709, to Bender, and there died in the same year. His story has been made the subject of a poem by Byron, of a novel by Bulgarin, and of two paintings by Horace Vernet.

MAZUFURABAD', a t. of India, in the Punjab, about 200 m. n.n.w. of Lahore, at the confluence of the Jhelum and its great tributary, the Kishengunga, over both which rivers there are ferries. It is of importance chiefly on account of its commanding position at the entrance of the Baramula pass into Cashmere. The emperor Aurungzebe built a fort here, which was subsequently replaced by one of greater strength, erected by the Afghan governor Ata Mahomed.

MAZUR'KA, a lively Polish dance of the grotesque kind, the music of which is sometimes in $\frac{3}{8}$ time, but more commonly in $\frac{3}{4}$. The peculiarity of the rhythm, which has a pleasing effect, is what characterizes the music of the Mazurka. It is danced by four or eight pairs, and is much practiced in the north of Germany, as well as in Poland.

MAZZA'RA, a city of the island of Sicily, 26 m. s. of Trapani, stands in a fine plain on the sea-shore. Pop. 11,000. It is inclosed by walls, and has a cathedral, an episcopal palace, a college, and several convents. It has a considerable trade in cotton, which is extensively grown in the neighborhood.

MAZZARI'NO, a t. of Sicily, in the fertile province of Caltanisetta, and 15 m. s.e. of the town of that name. Pop. 11,600.

MAZZEI, PHILIP, 1730–1816, b. Italy; practiced medicine for a number of years in Syria, and was afterwards engaged in mercantile business in London. In 1773 he came to Virginia with a number of Italian emigrants, familiar with the cultivation of the olive, which he wished to domesticate in this country, but the experiment proved unsuccessful. He became a sympathizer with the American revolutionists, and made the acquaintance of many of them in Virginia, including Jefferson, with whom he continued to correspond after his return to Europe, where he was successively attached to the service of the king of Poland and the Russian czar. He published in 1788 *Historical and Political Researches on the United States.*

MAZZI'NI, GIUSEPPE, one of the most remarkable men of modern Italy, was born in 1808 at Genoa, his father being a physician of note, of good private means. In youth Mazzini was noted for the warmth of his friendships, the fixity of his will, and the exaggerated susceptibility of his humane feelings. From birth sentiments of social equality were engendered in him by the example of his parents; and very early the degraded political condition of his country began to prey upon his mind, producing ardent aspirations for her national unity and deliverance from foreign domination, which seemed to him attainable only through a return to the republican glories of ancient times. Mazzini's patriotic enthusiasm speedily gained absolute sway over his spirit, and led him to renounce his cherished idea of a life of literature and contemplative study for the action and strife of the political arena. In 1827 his maiden essay in literature, "Dell' Amor Patrio di Dante," appeared in the liberal journal, the *Subalpino;* and he subsequently contributed critical, literary, and political papers to the *Antologia* of Florence and the *Indicatore Genovese.* In the pages of this latter originally appeared the essay subsequently republished under the title of *Scritti d'un Italiano Vivente.* Literature, according to Mazzini's own assertion, having been employed by the liberal party

solely as a *means* for the great *end* of liberal propagandism, the journals were suppressed, and the writers disbanded. In 1830, the affiliation of Mazzini to the secret society of the carbonari was the introductory step to his practical political career; and the young member was speedily invested with a preponderating influence in the counsels and missions of the body. Insnared and betrayed by a Piedmontese spy Mazzini was arrested, detained for 6 months in the fortress of Savona, and finally liberated on condition of his departure from Italy. After short residences in several places, he took up his abode in Marseilles, and thence he addressed to Charles Albert his famous letter, which drew down on the daring young writer a decree of perpetual banishment. The organization of a new liberal league, "Young Italy," was Mazzini's next work. Republican and unionist to the core, the tendencies of this great body were more humanitarian and universal than its extinct predecessor, carbonarism. In addition to the paramount aim of Italy's republican union under one common law, and the extinction of foreign rule, the general principles of this new association enforced the universal obligation to labor for a common moral regeneration, and the establishment of political equality over the world. Liberty, equality, and *humanity* were the watchwords of the body; "God and the people" their motto; white, red, and green their tricolored banner; education and insurrection the great agencies of their operations; assassination was erased from their statutes, and the symbolic dagger of the carbonari was replaced by the more humane emblems of a book and the cypress. Mazzini was the animating spirit of this formidable league, which speedily inclosed all Europe in a network of similar associations, modified to meet the individual requirements of the various European nationalities. Banishment from Marseilles in consequence of the extensive operations of the society having been revealed to the authorities compelled Mazzini to resort to concealment for a period of several months. About this time a charge was brought against him of advocating assassination as a legitimate weapon in the warfare of liberalism; but the charge was proved in the public tribunals of France to be false; and in the British parliament (1845) sir James Graham made an apology to Mazzini for having re-echoed the calumny. The first-fruits of La Giovine Italia was the revolutionary expedition of Savoy, organized by Mazzini at Geneva, but which was defeated by the royal troops. Sentence of death, *par contumace*, was recorded against Mazzini in the Sardinian courts for his participation in the affair; but he soon recommenced with increased vigor his revolutionary operations. A new association entitled, "New Europe," and based on principles of European rights and enfranchisement, was inaugurated by the exertions of Mazzini in Switzerland. In 1837 Mazzini quitted Switzerland for England, and finally took up his abode in London. From thence his labors in the Italian revolutionary cause have been incessant. To trace the part enacted by Mazzini in the great crisis of 1848 would be to record the history of that period, so intimately were his individual acts connected with the course of events. The resolute combatant of partial union and monarchical leadership at Milan, Mazzini retired to Switzerland on the capitulation of Milan to the Austrians, to reappear in Florence on the rising of Tuscany, and finally at Rome, where he was elected triumvir amidst the triumphant rejoicings of the capital of Italy. His tenure of supreme authority was marked by such wisdom, moderation, and success, as to elicit a public tribute of approbation from lord Palmerston. On the surrender of Rome by Mazzini's advice, he quitted the city, and proceeded to Lausanne *vid* Marseilles. The conduct of France he bitterly attacked in public letters to De Tocqueville and others. He subsequently returned to London, and at his instigation risings in Milan (1853) and in Piedmont (1857) were attempted. In 1859 while lending the whole weight of his influence to the revolutionary movements going on in Italy, he combated with vigilant foresight the threatened French predominance, and refused to accord faith to the liberal programme of Louis Napoleon. The Sicilian expedition of 1860 owed as much to the organization of Mazzini as to the heroic command of Garibaldi (q.v.). In 1864 he was expelled from Switzerland, and returned again to England. Next year he was elected by Messina deputy to the Italian parliament; but the election, to which he himself as a republican would have declined to accede, was canceled by the parliament. Mazzini is said to have founded in 1865 the "Universal Republican Alliance." In 1868 he fell into a dangerous illness, from the effects of which his health never recovered, though his zeal remained as ardent as ever. After an ineffective scheme for a republican rising, Mazzini ventured to enter Italy, and was arrested at Gaeta, where he remained a prisoner till Rome was taken by the Italian army. He condemned the Parisian commune of March, 1871. On his death at Pisa, Mar. 11, 1872, the Italian government honored him with a public funeral.

Mazzini's writings are various and extensive, and include dissertations on art, literature, and music. A complete edition (*Scritti, Editi e Inediti*) was published in 1861 and following years. Whatever may be thought of Mazzini's political views, few will refuse to admire the ardent sincerity of his patriotism, or the inflexibility with which he has pursued his aim, unchecked by persecution, calumny, and defeat. Mazzini possessed in the highest degree that personal fascination by which friends are converted into ardent partisans. In his private life he is allowed to have been a model of purity and frugal simplicity, as in his public career he was conspicuous for disinterestedness and self-abnegation; and to these personal virtues of Mazzini, aided by his extraordinary influence and eloquence, those who know Italy best ascribe a great share at least in inspiring that higher tone of life manifest in recent years among the Italian youth, without which the

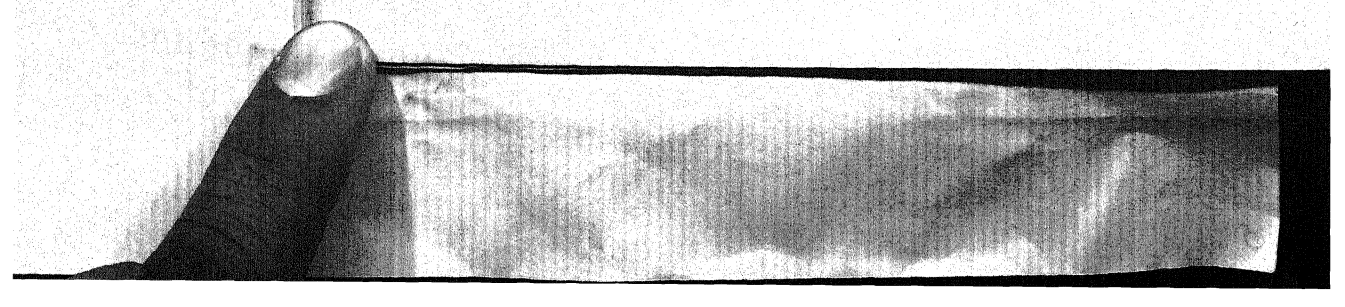
political regeneration of the country would have been impossible. See *Memoir*, by E. H. V. (London, 1874).

MAZZUCHELLI, Giovanni Maria, Conte, 1707–65; b. Italy; studied jurisprudence, but gave much attention to scientific researches. In 1737 he published his *Notizie Storiche e critiche intorno alla vita e agli scritti d'Archimede*, describing the various inventions attributed to Archimedes, and questioning the story of the mirrors by which Archimedes was believed to have burned the ships of Marcellus at Syracuse. The favor with which this work was received induced Mazzuchelli to undertake the task of compiling a great cyclopædia of Italian literature and science from the beginnings of Italian civilization. The first two volumes of this work, completing the letter A., appeared at Brescia, in 1753. He lived to publish four additional volumes which carry the work through B. He also wrote *Dissertazioni Storiche, scientifiche ed erudite*, containing an account of the meetings of a literary society which was accustomed to assemble at his house. He wrote biographies of Scipio Capece, and Giusto de' Conti; and he edited Villani's series of biographies of illustrious Florentines. He left a large collection of ancient manuscripts, medals, and casts, which were engraved and published with a descriptive text by the abbé Pietro Gaetano, at Milan.

MAZZUOLA, Francesco. See Parmigiano, *ante*.

MEAD, a fermented liquor made from honey. The honey is mixed with water, and fermentation is induced and conducted in the usual manner. Cottagers sometimes use the honey which remains in the combs after the usual processes of dropping and squeezing, for making mead, which is a thin and very brisk, but at the same time luscious beverage. Mead has been in use from very ancient times, and was known equally to the polished nations of southern Europe and the barbarous tribes of more northern regions. Pliny says it has all the bad qualities of wine, but not the good ones. The Latin name is *hydromeli*.

MEAD, Charles Marsh, D.D., b. Vermont, 1836; graduated at Middlebury college, Vt. in 1856, and at Andover theological seminary in 1862. In 1863 he went abroad and studied at German universities until 1866. Returning to Andover he accepted the professorship of Hebrew. He has given two lectures in Boston on *Christianity and Skepticism*. He was one of the American editors of Lange's commentary on the Bible, and is a member of the Old Testament company of the American committee now (1881) engaged in the revision of the English version.



MEAD, Larkin Goldsmith, b. Chesterfield, N. H., 1835; in the earlier part of his life resided at Brattleboro, Vt. In the year 1852 he began the systematic study of sculpture under Henry K. Brown, of Brooklyn. For this branch of art he had already shown a decided aptitude, and had attracted the attention of many artists by his first attempt in design, the execution *in snow* of the figure of an angel. His earliest work in marble was a reproduction of this and was called "The Recording Angel." In 1857 he modeled the colossal statue "Vermont," which now crowns the dome of the state-house at Montpelier, the capital. "Ethan Allen," a finely executed figure of Vermont's hero, adorns the same building, and is one of the artist's later works. Mr. Mead spent some time in Italy and particularly in Florence, whence on his return he brought a number of statuettes, such as "Echo," "La Contadinella," and the "Mountain Boy." He is an excellent draughtsman, as well as sculptor. The Lincoln monument at Springfield, Ill., was erected from his designs. Among his later works are also the soldiers' monument at St. Johnsbury, Vt., and "Columbus's Last Appeal to Queen Isabella." His sister is the wife of William D. Howells, editor of the *Atlantic Magazine*.

MEAD, Richard, 1675–1754; b. at Stepney, England, not far from London. At an early age he entered the university at Utrecht, and, after three years' study, went to Leyden, where he entered upon the study of medicine under the noted professors Pitcairn and Herrmann. After taking his degree of doctor of philosophy and physics he returned to Stepney and began the practice of his profession in 1696. In this he soon won the very first place. In 1703 Dr. Mead was made a member of the Royal society, and lecturer at St. Thomas's hospital. Oxford bestowed a diploma upon him, and after long acting as physician to the prince of Wales, was continued in the office on his accession to the throne, as George II. His reputation both as a practitioner and as a writer on medical subjects was very great, and he was in constant correspondence with the most eminent scientists of the day in his own and foreign countries. Most of his publications were written in Latin. Among them were: *De Imperio Solis et Lunæ in Corpora Humana et Morbis inde oriundis*, (1702), *On Small Pox and Measles*, (1748) *Monita et Præcepta Medica*, (1751), and many others. His works were translated into English and passed through many editions. In addition to his acquirements as a physician, Dr. Mead devoted much time to the study of natural history, antiquarianism and numismatics. Memoirs of his life were published by Dr. Matthew Maty in 1755, the year after his death.

MEADE, a s.w. co. in Kansas; 720 sq.m.; watered by the Cimmaron river and its branches, and well adapted to grazing.

MEADE, a co. in Kentucky, on the Ohio river, which separates it from Indiana; 500 sq.m.; pop. 9,485; the surface is rolling, the soil fertile; live-stock, tobacco, corn, oats, and wool are the principal products. Capital, Brandenburg.

MEADE, GEORGE GORDON, 1815–72; b. Cadiz, Spain; his parents being temporarily in that country. On their return to America, he was sent to the boys' school in Washington, D. C., at that time under the direction of Salmon P. Chase, afterwards chief justice of the supreme court of the United States. On leaving this school, he was sent to a military school at Mount Airy; and from there, in Sept., 1831, entered the military academy at West Point, where he graduated in the summer of 1835. He entered the army as brevet second lieut. of the third artillery, and at the end of the same year, 1835, received his commission as second lieut.; but on Oct. 26, 1836, he resigned from the army, after having, however, seen some active service in the Florida war, even within his brief military experience. He now adopted the profession of a civil engineer; and between 1837 and 1842, was employed as an assistant engineer in the surveys made by the U. S. government of the delta of the Mississippi, the Texas boundary, and the northeastern boundary of the United States. On May 19, 1842, he was reappointed to the army, with the rank of second lieut. of topographical engineers. On the breaking out of the war with Mexico, in May, 1846, when gen. Taylor crossed the Rio Grande, he was ordered to the front, and served throughout the war, being a member of the staff of gen. Taylor, and that of gen. Scott, and distinguishing himself in the battles of Palo Alto, Resaca de la Palma, and Monterey. He was brevetted first lieut., for gallant conduct at Monterey, in the five days' fight which closed Sept. 24, 1846. On his return to the states, the citizens of Philadelphia presented him with a sword. After peace was declared, lieut. Meade was employed in superintending river and harbor improvements, and in the construction of lighthouses on Delaware bay, and off the coast of Florida. He was promoted to be first lieut. in 1851, and capt. in 1856, and had charge of the national survey of the northern lakes until 1861, being at Detroit, Mich., at the period of the outbreak of the rebellion. He was ordered to Washington, and received his commission as brig.gen. of volunteers, bearing date Aug. 31, 1861, with the command of the second brigade of the Pennsylvania reserve corps. He was in the action at Dranesville, Va., Dec. 20, the first victory of the army of the Potomac; was at Mechanicsville, June 26, 1862; at the battle of Cold Harbor, on the following day; and served with his reserves, with which he had become identified, continuing with McClellan throughout the peninsular campaign, in McCall's division, being severely wounded at the battle of Frazier's farm (White Oak Swamp), June 30. He was appointed maj. of topographical engineers, June 18, 1862. On Aug. 29–30 he was engaged in the second battle of Bull Run; and in September took command of a division of the first army corps (gen. Reynolds'), and at the battle of Antietam was slightly wounded and had two horses shot under him. He was given command of the fifth army corps, and on Nov. 29, 1862, was commissioned maj.gen. of volunteers. He was engaged in the battles of Chancellorsville and Fredericksburg; covering the retreat at Chancellorsville with his corps, and guarding the crossings, until the entire army was safely over the river. On June 28, 1863, he was unexpectedly ordered to relieve gen. Hooker of the command of the army of the Potomac. This was the period of Lee's invasion of Pennsylvania, and the union army was in hot march to interfere with his plans, and, if possible, drive his sanguine forces south again. Portions of Lee's army had reached York, Carlisle, and the Susquehanna; but upon the advance of the federal army, these were called together from their various posts, and by order of gen. Lee, drawn in, and concentrated for a great field struggle. Those which were at Chambersburg crossed the South mountain towards Gettysburg, and those that were nearer the Susquehanna converged upon the same point. This was done by Lee, apparently under the impression that Meade designed to cut off his communications. And had it not been for Meade's maneuvering, Lee would have crossed the Susquehanna and struck Harrisburg, and probably even have made a dash at Philadelphia. Gen. Meade now saw that a great battle was inevitable, and at first concluded to receive it at the line of Pipe-clay creek, a small stream running a few miles s.e. of Gettysburg. But on consultation with gen. Hancock, who had been appointed to gen. Reynolds's command (that distinguished officer having been shot), and on the selection of Gettysburg by the latter, as a better ground on which to fight the battle, he made that his choice. [Swinton's *Army of the Potomac.*] The great battle was fought July 1–3, 1863. See GETTYSBURG. Gen. Meade's commission as brig.gen. in the U. S. army, bore the last of these dates. For the inestimable service which he had accomplished by the victory of Gettysburg, he was publicly thanked by a resolution of congress passed Jan. 28, 1866: "for the skill and heroic valor with which at Gettysburg he repulsed, defeated, and drove back, broken and dispirited, beyond the Rappahannock, the veteran army of the rebellion." From May 4, 1864, to April 9, 1865, gen. Meade commanded the army of the Potomac, under gen. Grant, through the disastrous struggle in the Wilderness, and until the capture of Petersburg, and the surrender of Lee. On Aug. 18, 1864, he was commissioned a maj.gen. in the U. S. army. At the close of the war he was placed in command of the military division of the Atlantic, which command he retained from July 1, 1865, to Aug. 6, 1866. During the years 1866–67 he was in command of the department of the e.; and subsequently of the third military

district of the s. (under the reconstruction laws), including Alabama, Georgia, and Florida, with his headquarters in Philadelphia. He was highly honored by his fellow-citizens for his high character, his great military ability, and the important share he had borne in the war of the rebellion. Philadelphians presented him with the house in which he died (Nov. 6, 1872); and after his death a fund of $100,000 was collected by subscription, and presented to his family.

MEADE, RICHARD KIDDER, 1750–1805; b. Virginia, was educated in London at the famous grammar school of Harrow, and, returning to his native state, at the age of 25 he commanded a company in the battle of Great Bridge, near Norfolk, Dec., 1775, the first engagement of the revolutionary war fought on Virginia soil. In 1777 he was promoted to the rank of col., and to the position of aid to gen. Washington, serving in that capacity until 1783. He was a prompt and faithful subordinate, always at hand, and rendered signal service to his country. He was present in an official capacity at the execution of maj. Andre. After the war he lived in retirement on his estate in Clarke county.

MEADE, RICHARD WORSAM, 1778–1828; b. Chester co., Penn.; son of George of Philadelphia, who was noted among his contemporaries for his ardent support of the revolution, in aid of which he contributed very large sums. The subject of this sketch very early in life engaged in the shipping business at Cadiz, Spain, where he sympathized with and assisted the Spanish patriot party, and during the peninsular war imported great quantities of provisions into Cadiz, then in a state of siege. From 1805 to 1816 he occupied the post of commercial agent for the United States, and in the last named year was arrested and imprisoned for two years in the castle of Santa Catalina on charges of conspiracy against the government. On the peremptory demand of the U. S. diplomatic agents, he was released; but his business had been completely ruined by his unjustifiable treatment, and a long legal contest for compensation ensued, in which Webster and others of our most eminent lawyers were engaged for him, but unsuccessfully. In this country Mr. Meade engaged in a large importing trade, made a large fortune, and his private art gallery was one of the first collected here by a private individual.

MEADE, WILLIAM, D.D., 1789–1862; b. in what is now Clarke co., Va.; educated at Princeton college, and after graduation in 1808 studied theology. For many years, as a clergyman of the Protestant Episcopal church, he gave his services without any charge; in 1829 he was appointed assistant bishop, and in 1841 bishop of the diocese of Virginia. It is worthy of note that, at the outbreak of the rebellion, he was earnestly opposed to the secession of his state. His principal literary productions are: *Lectures on the Pastoral Office; Letters to Students; Lectures on Family Prayers*, and *Old Churches, Ministers and Families in Virginia;* besides many papers published in church periodicals. An account of his life has been written by Dr. John Johns, who, in 1842, was appointed his assistant in the Virginia bishopric.

MEADOW GRASS, *Poa*, a genus of grasses, having a loose spreading panicle, the spikelets usually containing a number of florets, and with two glumes shorter than the florets, the florets each having two paleæ, which are bluntish and awnless, the fruit free. The species are very numerous, chiefly natives of the temperate and colder parts of the world, and forming in these a very important part of the herbage of pastures and meadows. Most of the species are of a slender and delicate appearance, with small spikelets and florets; and the herbage is tender, nutritious, and rather abundant. Of the British species, the ROUGH-STALKED MEADOW GRASS (*P. trivialis*) and the SMOOTH-STALKED MEADOW GRASS (*P. pratensis*) are among the most common, and are esteemed among the most valuable for sowing in mixtures of grasses for pasture.—The ABYSSINIAN MEADOW GRASS (*P. Abyssinica*), an annual species, yields immense returns of herbage in its native country, but a warmer climate than that of Britain seems to be requisite for its successful cultivation. It is called *Teff* in Abyssinia, and its seeds are used as corn for making bread. Beer is made by putting slices of this bread into warm water, the temperature of which is kept up in a close vessel for some days.—*P. annua* is an extremely common British species, springing up continually as a weed in cultivated grounds, and abounding on waysides as well as in pastures. It is often to be seen in flower, even in winter, and in summer is said to ripen its seeds in four or five weeks from the time of sowing. It is employed with advantage for sowing on greens in towns, and wherever from any cause perennial grasses are apt to be destroyed. It is very abundant in most parts of Europe, and Dr. Hooper found it at one of the most elevated passes of the Himalaya mountains. —Manna grass (q.v.) is closely allied to this genus.

MEADOW LARK, an American bird belonging to the order *Insessores*, sub-order *conirostres*, family *sturnidæ* or starlings, genus *sturnella*, common species, *sturnella magna*. It is a common bird of the eastern and middle United States, extending s. as far as Texas, inhabiting southern parts in winter, and going as far n. as the St. Lawrence river in the summer to breed. They are therefore birds of passage, returning to the south in flocks in the autumn, but while breeding, are not gregarious. They are beautiful singers, their songs being of the most joyous character and performed when flying high in the air, as well as when skimming over the meadows. Like most of the lark family they build their nests on the ground, among the green tall grass of the meadows. They live

upon insects and seeds, and are said to sometimes kill smaller birds. Their eggs, from four to five, are white with beautiful reddish brown spots, and are laid in oven-shaped nests. Body robust; legs and claws strong; tail yellow beneath, yellowish with brown bars above, with pointed feathers; whole length of body and tail 9 or 10 in.; back, dark brown, each feather having a brownish white margin and a brown terminal spot; breast and under side yellow, with a beautiful, black, pectoral crescent, convexity downwards; bill about an inch long, and characteristic of the family, although rather more slender than the average. See LARK, *ante*.

MEADOW MOUSE, an animal belonging to the order of rodents, family *muridæ* (rat family), genus *arvicola* (voles). There are many kinds of mice. See MOUSE, *ante*. The meadow mouse here designated, the *arvicola riparia*, is American. It is about 4½ in. in length with a tail about 1½; feet large and scaly; hair short; eyes small; no thumb on fore foot; color of back darkish brown, varying in depth, ashy on belly. Several species are described in the 8th vol. of the Pacific railroad survey. The European species are called campagnoles and voles; some of them are aquatic, digging in the marshes and banks of streams.

MEADOWS, a term somewhat indefinitely applied to moist level lands covered with grass, which is usually rich in consequence of the moisture, and often also from advantages of soil. The grass is either used for pasture, or is mown and carried away. *Water meadows* are meadows in which the supply of water is increased and regulated by artificial irrigation. See IRRIGATION. The herbage of all meadows consists generally of various kinds of grasses; meadow-grass, rye-grass, timothy, fox-tail, and bent-grass or fiorin, predominating.

MEADOWS (*ante*). The propriety of confining the word meadow either to moist or to level lands covered with grass is doubtful, for though moisture is essential to the growth of grass as to all other crops, and level ground is preferable to rugged, no greater moisture or more level surface is required for good meadow land than for good corn land. Marsh hay is made from marsh meadows, both fresh and salt; while timothy and red clover, grown for hay, flourish best in rich soils not particularly moist, and derive the same advantage from deep-till drainage as other field crops. Grasses of the red-top family grow best in soils a little more moist than required for the best growth of timothy. Meadows are more comprehensively defined to be lands growing grasses suitable for hay, whether upland or low land, seeded by hand as on farms, or growing wild on marsh alluviums, or western plains, or mountain valleys. The vast prairies in the basin of the Mississippi were probably the greatest extent of natural meadows in the world. Where these grasses were fed down by cattle they ceased to be meadows and became pasture. The use of mowing-machines has quite revolutionized the labor of cutting hay within the past thirty years, and by their use long reaches of narrow valleys among the drier plains, and still narrower bottoms of defiles in the Rocky mountains, are made to yield hay for the needs of regions where hand labor could not be obtained to do the work. The second mowing of meadows in one season is called the aftermath. The seed of clover is usually obtained from its second cutting. In connection with landscape effects meadows and pasture-lands are grouped together, and it is one of the beautiful effects of cultivated crops in scenery that their different colors and modes of growth checker a landscape with varieties of light and shade never seen where there is no cultivation. A meadow before the cutting, by the side of one recently cut, makes a contrast as of two different crops, more marked than the contrast between the uncut meadow and the pasture-field. There is no season of the year when lights and shadows in rural scenery are so charming as just after the harvest, or when the hay cutting is nearly done, and the shadows of trees and clouds are brightly outlined on their shaven stubble.

MEADOW SAFFRON. See COLCHICUM.

MEADVILLE, a city in n.w. Pennsylvania, incorporated 1866; on the e. bank of French creek at its entrance into the Alleghany river, and on the Atlantic and Great Western railroad; pop. '70, 7,103. It is the terminus of the Franklin branch railroad to Oil City, the center of a fertile agricultural region, well watered, and having a large production; and is a central shipping point, market, and depot for the oil regions. Petroleum oil, lumber, and grain are the chief products of Crawford co., in which it is situated, 100 m. n. of Pittsburg, 36 m. s. of Erie, and 24 m. w. of Titusville. It is the seat of a Unitarian theological seminary, established 1844, with a library of 12,000 vols., and of Alleghany college, a Methodist Episcopal institution, founded 1817, open to both sexes, having a library of 12,000 volumes. It has an elegant court house, 3 hotels, 15 churches, good public schools in handsome edifices, 6 banks, 2 of them national with a joint-capital of $300,000, a public library of 3,000 vols., a state arsenal, 4 newspapers, and an opera house. It has a public park; and Greendale cemetery, pleasantly located and tastefully laid out, is in the immediate vicinity. Its leading industries, which are important, are the manufacture of agricultural implements, carriages, engines, wooden shoes, edge tools, paper, and woolen goods; and it has oil refineries, machine shops, and extensive railroad repair shops.

MEAGHER, a co. in central Montana, having the Missouri river for its w. boundary, drained in the s.e. by the Muscleshell river, an affluent of the Missouri, and in the n.e. by

the head waters of the Judith river; 7,650 sq. m.; pop. '80, 2,744—2,095 of American birth, 285 colored. Its surface is composed of mountain, plain, and valley; its plains stretching out for miles treeless and verdureless, covered with the short brown buffalo-grass, with no break to the monotony but the telegraph poles, 30 to a mile, along the river, and the print of wagon wheels, the double track of the team, and the single track of the pony by its side. In other sections the mountains of the Belt and Snowy range rise into steep buttes, round and smooth, or jagged by the action of the atmosphere, around whose sides the road cautiously winds, or precipitates itself through narrow cañons overlooking the beautiful green lawns of the Judith valley, where suddenly appears the "shack" (log house) and wood-pile of the frontiersman, the harbinger of swift-coming civilization. In this wide, fertile valley the soil is adapted to stock-raising, and the culture of all northern products that will survive its winters. It contains some of the best land in that part of the country for the cultivation of apples and pears; and butter is one of the chief commodities. It is being rapidly settled by emigrants from the southern and western states, and its agricultural products are beginning to attract notice. Placer mining of gold in the mountains has been the greatest source of its wealth. Seat of justice, Diamond City.

MEAGHER, THOMAS FRANCIS, 1823–67; b. Waterford, Ireland; educated at the Jesuit college of Clongowes Wood, and Stonyhurst college, Lancashire, Eng. He was a close and earnest student, and in 1842 was awarded the silver medal for English composition, defeating more than fifty English students. On completing his studies he interested himself in Irish politics, and became one of the "Young Ireland" party; and, displaying great oratorical powers, was a very popular leader. On the outbreak of the French revolution in 1848 he was sent to Paris to congratulate the republican leaders. On his return to Ireland he was arrested on a charge of sedition, held to bail, afterwards tried for high treason, found guilty, and sentenced to death; but subsequently the sentence was changed to banishment for life to Van Diemen's Land. He was accordingly transported thither, but escaped in 1852, and succeeded in reaching New York. Here, for two years, he devoted himself to lecturing, with great success. In 1855 he commenced practice at the New York bar, and the following year became the editor of the *Irish News*. At the beginning of the rebellion in 1861 he organized a company of zouaves, joined the 69th regiment, N. Y. volunteers, was acting maj. at first Bull Run, and after serving the three months of the first call, returned to New York and organized the Irish brigade, being commissioned brig. gen. Feb. 3, 1862. He was engaged in the seven days' battles, at Manassas, and at Antietam, being specially commended by gen. McClellan in his report of the latter engagement. At Fredericksburg he was seriously wounded in the leg while charging with his men on Marye's heights, and was incapacitated for further fighting. He resigned temporarily, but was recommissioned in 1864, and held command in Tennessee and Georgia, performing distinguished service. In 1864 he was appointed secretary of Montana territory, and for some time performed the duties of governor in the absence of that official. On July 1, 1867, he fell from the deck of a steamer, at fort Benton, on the upper Missouri, and was drowned. He was at the time traveling to take measures for the protection of the white settlers in that region, threatened by the Indians. One of his last acts was to contribute to the pages of *Harper's Magazine* a most entertaining paper entitled "Rides through Montana," and which was designed to be the first of a series. Three weeks before his death he wrote to his publishers as follows: "Ever since I dispatched to you the text of my paper on Montana I have been in the field 200 miles from here against the Sioux and other implacable red devils." He published, also, *Speeches on the Legislative Independence of Ireland;* and *Last Days of the 69th New York Regiment in Virginia.* He was a man of brilliant and versatile capacity, and a soldier of unfailing resources and marked personal daring.

MEAL (Sax. *mæl*, a part or portion; Ger. *mahl*), a portion of food taken at one time, a repast. The number of meals eaten per day has varied at different times and in different countries. Among the Greeks and Romans of the classic ages, it was the general practice to have the principal meal toward evening, a light meal in the morning, and another in the middle of the day. The *akratisma*, *ariston*, and *deipnon* of the Greeks, corresponded nearly to the breakfast, luncheon, and dinner of our own country at the present time; the first was taken immediately after rising in the morning, the second about midday, and the *deipnon*, the principal meal, often not till after sunset. In Rome of the Augustan age, the three corresponding meals were *jentaculum*, *prandium*, and *cæna*. The two former were simple and hasty, except among persons of luxurious habits, with whom the midday meal was sometimes of an elaborate description. The *cæna*, taken in the evening, consisted of three courses, with often a great variety of viands. Reclining was the usual posture at meals for the men, the women and children sitting. Two persons, and occasionally three, reclined on one couch. Before a guest took his place at table, his shoes were taken off, and his feet washed by an attendant.

In mediæval and modern Europe, the prevailing practice, down nearly to the middle of last century, was to have three meals in the day, the midday and not the evening meal being the principal one. The habits of all classes were early; four was a usual hour for rising, and five for breakfast. Twelve was the dinner-hour, when it was the usage in England, down to queen Elizabeth's time, for every table, from that of the twenty-shilling freeholder to the table in the baron's hall and abbey refectory, to be open

to all comers, with free fare, bread, beef, and beer. Supper followed in the evening, a less abundant repetition of dinner. In the course of the last 120 years, a revolution has been going on in the hour of dinner, which has gradually got later till it has reached the present usage of from six to eight in the evening among the more cultivated classes. The introduction of tea and coffee has, to a certain extent, changed our habits as regards meals. They form an essential part of our breakfast, which is later than that of our ancestors, from nine to ten. The meal called tea is but a part of dinner, and supper, as a regular meal, has nearly disappeared. A light meal, called luncheon, is often taken between breakfast and dinner. Our dinner has therefore come nearly to correspond with the supper of our ancestors. This change of hours has brought with it one important change to the better in social habits; the excessive drinking, so common during the Georgian era, even among people of refinement, has disappeared; the long carousals of that period have been abridged to an hour, or half an hour, spent over wine after dinner. In Britain, dinner is, more than anywhere else, made a social meal, and an occasion of meeting one's friends; and public dinners, with toasts and after-dinner speeches, are a characteristically British mode of celebrating any public event or anniversary. In France and Italy, the gradual advance of the dinner-hour has not proceeded further than four or five o'clock. In Germany, the usage still obtains, to a large extent, of an early dinner and a supper. One o'clock is a usual dinner-hour, and even the court hour has hardly advanced beyond three and four. In Vienna, and some other parts of Germany, it is not uncommon to have five meals a day—breakfast, luncheon, dinner, tea, and supper.

MEAL. See BREAD.

MEAL-TUB PLOT. An attempt at conspiracy which Dangerfield made in 1679 against James duke of York; so called because the paper containing the scheme was hid in a tub of meal in the house of Mrs. Cellier. Dangerfield, having at length admitted that the whole affair was a forgery, was whipped and compelled to stand in the pillory.

MEAL-WORM, the larva of *tenebrio molitor*, a coleopterous insect of a genus allied to *blaps* (q.v.), but possessing wings and wing-covers. The perfect insect is of a pitchy or dark chestnut color, smooth, about half an inch long, with short 11-jointed antennæ, and stout legs. It is a common insect in Britain, most active in the evening, abounding in granaries, mills, and houses in which considerable stores of meal or flour are kept; as its eggs are deposited among these substances, on which the larva feeds, often doing considerable injury. Stores of ship-biscuit often suffer from this cause. The larva is about an inch long, thin and round, of an ocherous color, with bright rusty bands, very smooth and glossy, with six small feet, and two very short antennæ.—Another species, *T. obscurus*, has been introduced with American flour, and has become pretty common in some parts of Britain. The insect is of a dull black color above; the under parts, legs, and antennæ, chestnut. The larva is shining and pale brown.—Cleanliness and care are the best preventives of these pests. Meal-worms are a favorite and excellent food of caged nightingales.

MEALY BUG, *Coccus adonidum*, an insect naturalized in our hot-houses, and very injurious to pine-apples and other plants. It is reddish, and covered with a white powdery substance. See COCCUS.

MEAN, in mathematics, is a term interpolated between two terms of a series, and consequently intermediate in magnitude. The *geometric mean* (q.v.) of two numbers is always less than the *arithmetic mean* (q.v.), and greater than their *harmonic mean;* and the geometric mean is itself a geometric mean between the two other "means."

MEANS, ALEXANDER, D.D., LL.D., b. Statesville, Iredell co., N.Y., in 1801; was educated at the academy at Statesville; removed to Georgia in 1822, and after teaching school for four years attended medical lectures at Transylvania university, Ky., and commenced the practice of medicine in Covington, Ga., 1826; the same year was licensed to preach by the Methodist Episcopal church. In 1834 he was appointed to superintend the manual labor school near Covington; was chosen professor of the natural sciences at Emory (now Oxford) college. After a service here of 18 years, he was appointed in 1840 professor of chemistry and pharmacy in the medical college of Georgia, at Augusta, lecturing in winter, and performing his duties as professor in Oxford college 8 months of the year. In 1853 he presided over the masonic female college in Covington; was called to the presidency of Emory college in 1854, and shortly after to a professorship of chemistry in the Atlanta medical college, accepting the latter and retaining it for 12 years. In 1851 he traveled in Europe. In the state convention of 1861 he spoke and voted against secession, but afterwards identified himself with the south. He has held since the war the position of state agricultural chemist at Savannah, retaining at the same time his connection with Emory college. He has published *Centennial of Chemistry*.

MEARES, JOHN, 1746–1801, b. England; entered the navy in 1776; served against the French in the West India islands; became captain in the merchant service after the peace of 1783; went to India and formed at Calcutta what was called the *Northwest America company* for opening trade with Russian America. In 1786 he explored a

part of the coast of Alaska; went to China by way of the Sandwich Islands; entered Nootka sound, 1789; examined and took possession of the neighboring coasts in behalf of England, and reached Macao Dec. 5, 1789. He published *Voyages made in the years 1788-89 from China to the northwest coast of America*, 2 vols.

MEARIM RIVER; in Brazil, called also the Miarim and the Maranhao, rises in the n. central part of the province of Maranhao, and follows a general northerly direction, emptying into the bay of São Marcos. It has many affluents, of which the most important is the Pindare. Its entire length is about 350 m.; it is navigable, and several steamers ply upon it. The river is specially notable for the tremendous force of its current, which for a long time resists the action of the tide, and is at last overcome with a roaring sound and an exceedingly swift rush upward of the waters.

MEARNS. See KINCARDINESHIRE.

MEASLES (known also as RUBEOLA and MORBILLI) is one of the group of blood-diseases termed *Exanthemata* (q.v.), although, from the eruption which appears on the surface of the body, it is sometimes classed with the skin-diseases. It is communicable from person to person, and seldom occurs more than once in the same individual. Its period of incubation—that is to say, the time that elapses between exposure to the contagion and the first appearance of the febrile symptoms which precede the eruption—is usually about a fortnight; then come lassitude and shivering, which are soon followed by heat of skin, increased rapidity of the pulse, loss of appetite, and thirst. The respiratory mucous membrane is also affected, and the symptoms are very much the same as those of a severe cold in the head, accompanied with a dry cough, a slight sore throat, and sometimes tightness of the chest.

The eruption which is characteristic of the disease usually appears upon the fourth day from the commencement of the febrile symptoms and the catarrh—seldom earlier, but not unfrequently some days later. It is a rash, consisting at first of minute red papulæ, which, as they multiply, coalesce into crescentic patches. It is two or three days in coming out, beginning on the face and neck, and gradually traveling downwards. The rash fades in the same order as it occurs; and as it begins to decline three days after its appearance, its whole duration is about a week. The red color gives way to a somewhat yellowish tint, and the cuticle crumbles away in a fine bran-like powder; the process being often attended with considerable itching.

There are two important points in which it differs from small-pox (q.v.), with which in its early stage it may be confounded; these are—1. That the fever does not cease or even abate when the eruption appears, but sometimes increases in intensity; and (2), that the disease is not more severe or more dangerous because the eruption is plentiful or early. The character of the eruption, after the first day, will serve to remove all doubt regarding these two diseases; and the comparative prevalence of either disease in the neighborhood will materially assist in forming the diagnosis. It is distinguished from scarlet fever (q.v.), or scarlatina, (1), by the presence at the outset of catarrhal symptoms, which do not occur in the latter disease, at any rate, prior to the eruption; (2), by the absence of the throat-affection, which always accompanies well-marked cases of scarlet fever; (3), by the character of the rash, which in measles is said to present somewhat the tint of the raspberry, and in scarlet fever, that of a boiled lobster; which in measles appears in crescentic patches, and in scarlet fever is universally diffused; which in measles usually appears on the fourth day, and in scarlet fever on the second day of the disease.

In ordinary uncomplicated measles, the prognosis is almost always favorable. The chief danger is from inflammation of some of the textures that compose the lungs; and in scrofulous children, it often leaves chronic pulmonary mischief behind it. No age is exempt from the disease, but it is much more common in childhood than subsequently. The reason is probably that most persons have it in early life, and are thus protected from an attack at a later period.

In mild forms of the disease, nothing more is requisite than to keep the patient on a low diet, attend to the state of the bowels, and prevent exposure to cold, which is best accomplished by keeping him in bed with the ordinary warmth to which he is accustomed in health. If the chest symptoms become urgent, they must be treated according to their nature. Bronchitis (q.v.), sometimes extending into pneumonia (q.v.), is most to be feared. If the eruption disappear prematurely, it may sometimes be brought back by placing the patient in a warm bath. In such cases, stimulants are often required, but must, of course, only be given by the advice of the physician. The patient must be carefully protected from exposure to cold for a week or two after the disease has apparently disappeared, as the lungs and mucous coat of the bowels are for some time very susceptible to inflammatory attacks.

MEASURE, in music, is a term applied to the quantity of notes which are placed in the bar, and which is generally called the *time*, of which there are but two kinds, viz., common time, containing an equal quantity of notes in the bar, and triple time, containing an unequal quantity. Common time is generally marked with a C at the beginning, which means that every bar contains four crotchets, or their value in other notes. There are also other kinds of common time, which are marked $\frac{2}{4}$, $\frac{6}{4}$, $\frac{6}{8}$. Triple time is

marked $\frac{2}{2}$, $\frac{2}{4}$, $\frac{2}{8}$, $\frac{2}{8}$, $\frac{2}{4}$. Sometimes, in common time, we have $\frac{1^2}{4}$, $\frac{1^2}{8}$. The lower figure indicates the parts of the semibreve, and the upper figure shows how many of these parts there are in the bar.

MEASURE OF DAMAGES, the body of rules which governs the amount of pecuniary compensation awarded by courts of justice for violation of personal or property rights. In its most extended sense it might be said to cover almost the whole ground of legal procedure; but is used not to represent inquiry as to what cases require the award of damages, but rather, as to what limit should be placed on the award in certain cases. The rules apply to common law rather than to equity, as the former is, in general, remedial in its nature, and the latter preventive, offering injunctions, specific relief, etc. In early English law the question of damages was left to the jury, while in countries whose jurisprudence is founded on the civil law, the question was left to the discretion of the magistrate; but common law declares that the compensation must be fixed by those legal rules which form the Measure of Damages; though these are not as yet free from contradiction and discrepancy. "The general rule," says Story, "is that whoever does damage to another, is liable in damages to the *extent* of that injury; it matters not whether it is to the property or person or rights or reputation of another." But not every loss gives right to legal relief; the injury must be *legal*. Thus injury to moral sentiments has no remedy. Suit cannot be sustained by a private individual for a public wrong, as a highway nuisance, unless there be some element of special injury to him. Injury may consist in direct or indirect pecuniary loss, value of time, expenses such as costs and counsel fees, mental suffering and the sense of wrong or insult arising from the intention to vex or annoy. But the law will refuse to give compensation for any of these kinds of injury except direct pecuniary loss and the costs of the suit, unless, indeed, there be present the element of malice and willfulness; or, as has been said, it will divide the loss, discriminating between that which must be borne by the offending party and that which must be borne by the sufferer; but where there is fraud, malice, or gross negligence, vindictive or exemplary damages will be given. In quantity, the damages may be nominal or substantial; nominal when there is *injuria sine damno*, legal injury but no actual loss. The giving of nominal damages often suffices to establish rights or titles, as in action for trespass on lands. It is well settled in American law that where there is *any* invasion of right there must be at least nominal damages, and it is often the duty of the court to so instruct the jury. In such cases care should be taken not to hold the defendant for costs, if the action is trifling and tinged with malice.

What may be included under consequential damages? Usually the consequences must be direct and immediate; in the words of the N. Y. supreme court, "must be the fair natural and legal result of the breach of the defendant's agreement. Prospective or continuing profits are usually excluded, if not very clearly the natural result." Thus in a suit for price of a steamer, the profits on trips she might have made were disallowed. But when goods have deteriorated in market value the courts will give compensation for the loss. If there is no element of contingency and the profit was certain and actual, it will be admitted. In torts, also, the damages are confined to direct consequences, but incidental expenses are sometimes allowed. In a case where an anchor was warranted, it was held that the holding of the cable was of the essence of the warranty, and it was even implied that if the ship were lost by the imperfection of the anchor, a suit would lie for its value. If an act is illegal or mischievous of itself the courts will go far in construing the law of consequential damages. If a plaintiff could have avoided the injury without loss or danger he cannot recover; and this law of contributory negligence is very important in torts such as nuisance or collision. As to award of costs, there is some conflict; but they usually go with the verdict, unless the suit be vexatious and won on mere technical rights. Though, as a rule, damages are only allowed for injury up to the time action is brought, yet in many cases of contracts where successive suits are impossible from the *entirety* of the contract, and in torts and trespass, greater latitude is allowed. If, in a continuing agreement the violation has, of necessity, entailed loss after the bringing of action and if the loss is certain and ascertainable, prospective damages will be given. And in torts the averment may be of loss *probable;* as, in case of injury by negligence of a railroad, it may be set forth that plaintiff's health is permanently injured. In case of a contract to pay money, there can be no consequential damage beyond legal interest; if it be to do or not do some act, the law will consider only those consequences which seem to have been in the contemplation of the parties at the time; and in case of torts in which no fraud or malice enters, only natural and proximate consequences are considered. In regard to real estate, it was formerly thought to be in the very nature of actions for possession that damages did not lie; but there has been much statutory enactment on the subject, and damages are now generally allowed in actions of ejectment and dower. In the first, the damage in the actual ejectment is almost always nominal; but, though the improvements pass with the land, *mesne profits* are given to the plaintiff to the extent of the annual value, as well as costs and sometimes interest and compensation for his trouble. In New York, for instance, interest is allowed on rents, but all *equitable* defenses are admitted. In dower the English law of damages is governed by the statute of Merton, and it is generally held here that damages accrue after a husband's death and are to be measured by one-third the mesne profits:

but the usual course in dispossession from dower land is by action of ejectment, the old writ of dower having fallen in disuse. Without going into details as to the measure of damages in cases of trespass, waste, nuisance, and real covenants, it may be said that with few exceptions the general rule of natural relation and compensation for actual injury governs. In contracts, many and important classes are presented, such as negotiable paper, insurance, sale and warranty of chattels, agency and suretyship. In all these the jury has lost much of the power possessed in former times, and it is well settled that it is for the court to determine the measure of damages and for the jury only to determine the amount under that rule. It is clear that the motives of the contracting parties do not fix the rule, though in breach of promise of marriage the jury may take all facts into consideration, as it is impossible to formulate a law of damages which will cover the peculiar injury. Other exceptions exist; but, where the contract is not unconscionable, it furnishes the measure of damage itself. Contract price is recoverable and actual loss is the basis of compensation, so that *quantum meruit* applies. With all negotiable paper the measure is easily and arbitrarily fixed by the legal rate of interest. Marine insurance has special laws arising from the nature of the peculiar doctrines of general average and total and partial loss; in fire insurance the actual loss is the measure; while in life insurance no actual loss need be shown by the assignee of a policy. In contracts for the sale of personal property, the vendee after breach of contract by the vendor can, by the usual rule, recover only the difference between the contract price and that on the day fixed for delivery; but it has been held in cases involving stock transactions that the vendee can recover the highest price reached by the stock in the interval. The vendor can recover full price as against the vendee on refusal of the latter to receive the goods, even though they are not actually delivered. Warranty of personal property is governed as to damages by the actual value and not the contract price, if there be no fradulent representations. The principle has been disputed but is now well settled in this country. A surety must pay the claim he guarantees before he can sue his principal, and his damage is measured by the amount, interest, and costs. An agent can be sued by his principal for the whole loss incurred by his negligence, even though not the direct consequence of his act; and in such cases cannot offset his commission. In actions against common carriers indemnity is afforded for actual loss at time of injury; the value of goods destroyed is estimated at the place of destination and interest is reckoned under the law of that state. Where transportation of a passenger is refused, after contract to do so, the injury by loss of time and wages or profits is the measure. But the loss must be actual; thus the rate of wages in the plaintiff's trade at the place of destination was admitted as evidence of probable loss but not to set the measure of damage; and courts have even said that the expenses of an illness following but not caused by railroad detention and prolonging such detention might be included in the damages, so far as they were in excess of what they would have been elsewhere. Where a telegraph company undertook to transmit a message and, by their negligence, plaintiff lost a chance to collect an otherwise worthless debt, the corporation was held to be a common carrier and liable. Other decisions are averse to this doctrine. Dispute on the point is usually avoided by provisions made part of the contract, disclaiming such responsibility. If the company is a common carrier it is, in effect, an insurer, is bound to use more more than ordinary care, and liable for consequential damages.

Interest is always allowed when a sum is to be paid at a certain time, the law assuming that legal interest begins at that date; and the courts of this country have been very liberal in inferring that an understanding for interest existed; but if claims are uncertain or unliquidated, interest will not be allowed. A most important distinction exists between liquidated damages and a fixed sum agreed upon as a *penalty*, as in bonds. In the first case the parties have fixed a sum certain as the measure of damage from breach of contract; but the courts will often refuse to consider the amount as intended to be absolute and will measure the actual loss. The intent of the parties on the point must govern rather than the language. The tendency in this country is to frequently consider a stipulated sum as liquidated damages and but rarely to regard it as a penalty; and the first, especially if there is appearance of usury or oppression; and, if there is nothing to certainly determine the damages *outside* of the stipulation, they will invariably be considered liquidated. Recoupment and set-off will be allowed even where the demand is not for a liquidated sum.

Vindictive or exemplary damages have already been referred to. The principle applies mainly in cases of tort and very materially enlarges the considerations regarded in fixing the measure of damages. Where there has been maliciousness or fraud or evil intent, the jury may go beyond the principle of compensation and punish defendant by heavier damages. In torts the intent of the wrong-doer is of great moment, and though it may seem incongruous that the penalty should be paid to the plaintiff rather than to the state, yet in practice it is the most effective mode of punishment. The rule that the jury may take evil intent into consideration is now well settled both in England and in the United States. In cases of libel and slander the law will often not require the least proof of actual injury, a distinction being drawn between words actionable *per se* where damage is presumed, and other libels in which actual injury must be set out. The subject of measure of damages will be found treated in detail in works devoted to the special topic by Maine, Field, and Sedgwick, and its application to various branches of

jurisprudence is set forth under many heads in Parsons *On Contracts*, Greenleaf *On Evidence*, and Redfield's *Railroad Law*.

MEASURES. See WEIGHTS AND MEASURES, *ante;* METRIC SYSTEM.

MEAT EXTRACT, a substance of a composition varying with the process employed, extracted from beef or mutton or other animal flesh, and used as an article of diet. The well known common beef tea is made in various ways, and differs greatly in strength. A common method, and perhaps the best when required fresh and condensed, is to put the chopped meat without the addition of any liquid in a bottle and immerse this in a vessel of water at about 180° F. The blood, lymphatic, and muscular juices ooze out of the meat and form a red liquid containing a large amount of soluble nutritious proteine matter. If this is heated to the boiling point, there will be considerable coagulation and the fluid extract will not be so easily digestible. If the meat, on being heated to about 180° F. be pressed, most of the nutritious substances will be expressed, and the extract so obtained, on being evaporated, may be brought to any desirable degree of solidity. This solid extract, by the addition of common salt, can be kept, especially in closed jars, an indefinite length of time, and makes, when mixed with hot water, an excellent beef tea for the sick room. Another method of making beef tea is very common, and in many cases perhaps the best, because it is seldom that it is desirable to have it in too condensed a state. Patients require considerable drink, and this is conveniently given in well-seasoned beef tea, made by heating chopped beef in water to about 200° sufficiently long to extract most of the nutritious material. It is more palatable than that extracted by the bottle process, and for food and drink combined is in most cases superior. A portion of the meat may also be boiled and made into a broth, where the patient's stomach is in a condition to digest it readily. The albuminoids are, of course, precipitated by boiling, but the shreddy precipitate may be taken with the clear liquor often with benefit.

MEATH, a maritime co. of the province of Leinster, Ireland, bounded on the e. by the Irish sea and the county of Dublin; area, 906 sq.m., or 580,083 acres, of which 547,391 are arable, about 30,000 waste, bog, etc. Pop. '51, 140,748; '61, 110,575; '71, 95,558, of whom 89,140 are Roman Catholics, 5,826 Protestant Episcopalians, the rest Protestants of other denominations. The surface is for the most part an undulating level, forming the eastern extremity of the great limestone plain of Ireland, and rising slightly towards the n. and north-west. No minerals of any importance are found. The soil is a rich loam, and extremely fertile; but it has long been devoted almost entirely to pasture; the total extent under crops in 1876 being only 140,720 acres. In the same year the cattle amounted to 170,349, the sheep to 217,065, and the pigs to 17,085. The chief rivers are the Boyne and Blackwater. The principal towns are Trim, Navan, and Kells, in the first of which the assizes are held. Meath possesses abundant means of communication, being intersected by numerous roads and several railways, also by the royal canal. The coast-line, about 10 m., has no port of importance, even as a fishing-station. The occupation of the people is almost wholly agricultural. The number of children attending the national schools in 1875 was 16,972. Anciently, Meath, which included West Meath, and probably portions of several other adjacent counties, formed one of the kingdoms into which Ireland was divided, the royal seat being the celebrated Temor or "Tara of the kings," the scene of the first preaching of Christianity under St. Patrick. After the English invasion, Meath was early occupied by Strongbow, and was erected into a county palatine by Henry II., who conferred it on Hugh de Lacy. From this time forward, it was the scene of many conflicts. In the end of the reign of Henry VIII. it was separated into e. and w. Meath. Few Irish counties present so many interesting relics of Irish antiquities of all the various periods. Celtic remains abound along the Boyne and Blackwater. The earthworks of the ancient royal seat at Tara are still discernible, and some valuable and highly characteristic gold ornaments were there discovered. John's castle at Trim is one of the most extensive monuments of English rule in Ireland. The round tower and sculptured crosses of Kells are singularly interesting; and almost every parish in the county contains some relic of the feudal or ecclesiastical structures which formerly covered the land. Meath returns two members to parliament.

MEAUX, a t. of France, in the department of Seine-et-Marne, on the river Marne, 25 m. e.n.e. of Paris. It is a bishop's see, and its cathedral, begun in the 11th c., is a noble Gothic structure. Bossuet, the famous preacher, was bishop here, and is buried in the choir. Corn and flour from the water-mills on the Marne are sent to Paris in large quantities, and there are manufactures of cotton and other cloths, pottery, leather, saltpeter, etc. Pop. '72, 9,528.

MECCA (*Om Al Kora*, mother of cities), one of the oldest towns of Arabia, the capital of the province of Hedjaz, and, through being the birthplace of Mohammed, the central and most holy city of all Islam. It is situated in 21° 30′ n. lat., and 40° 8′ e. long., 245 m. s. of Medina, and about 65 m. e. of Jiddah, the well-known port on the Red sea, in a narrow, barren valley, surrounded by bare hills and sandy plains, and watered by the brook Wadi-Al-Tarafeyn. The city is about 1500 paces long, and about 650 broad, and is divided into the upper and lower city, with about 35 chief quarters. The streets are broad and rather regular, but unpaved; excessively dusty in summer, and muddy in

the rainy season. The houses, three or four stories high, are built of brick or stone, ornamented with paintings, and their windows open on the streets. The rooms are much more handsomely furnished, and altogether in a better state than is usual in the east; the inhabitants of Mecca making their living chiefly by letting them to the pilgrims (see HAJJ) who flock here to visit the Beit Ullah (house of God), or chief mosque, containing the kaaba (q.v.). This mosque, capable of holding about 35,000 persons, is surrounded by 19 gates surmounted by seven minarets, and contains several rows of pillars, about 20 ft. high, and about 18 in. in diameter, of marble, granite, porphyry, and common sandstone, which at certain distances are surmounted by small domes. A great number of people are attached to the mosque in some kind of ecclesiastical capacity, as katibs, muftis, mueddins, etc. No other public place or building, sacred or profane, of any importance is to be found in this city, which also is singularly destitute of trees and verdure of any kind. It is protected by three castellated buildings, and is governed by a sherif. The population has, in consequence of the rapidly decreasing number of pilgrims, fallen off considerably of late, from above 100,000 to hardly 40,000, who do not find the 100,000 annual pilgrims sufficient to keep them in the state of prosperity of former years. The trade and commerce of Mecca hardly deserve mention; the chief articles manufactured there are chaplets for the pious pilgrims. The townspeople themselves are lively, polished, and frivolous, and growing up amid an immense concourse of strangers from all parts of Asia, are generally able to converse in three or four eastern languages. Respecting the history of Mecca, it was known to Ptolemy already as Macoraba, and first belonged to the tribe of the Kosaites, later to the Koreish. Mohammed, who had been obliged to leave it precipitately (see HEDJRAH) in 622, returned to it and conquered it in 627. Within the course of the present century, Mecca was taken by the Wahabites (1803), but given up again to the pasha of Egypt, Mehemed Ali (1833), whose son, Ibrahim, was made Sheik El Haram—"of the sacred place." At present, however, Mecca is directly dependent on the sultan.—A certain balm, called balm of Mecca, is made from a plant which grows in abundance in the neighborhood of the city, called *besem.*

MECCA BALSAM. See BALSAM OF BALM OF GILEAD, *ante.*

ME'CHAIN, PIERRE FRANCOIS ANDRÉ, 1774–1805; b. France; studied for a time at the school *des Ponts et Chaussées*, which he was compelled to leave for want of money. He then gave instruction in mathematics, giving all his spare time to the study of astronomy. Soon afterwards he was accidentally brought to the notice of Lalande, who had bought of him an astronomical instrument, which poverty had obliged him to sell. Lalande secured him a place as government hydrographer. In this capacity Mechain drew up a number of marine charts, and made a survey of a part of the French sea-coast. He still pursued his astronomical studies, investigated the theory of eclipses, calculated the orbits of 24 comets, and discovered 11. The academy of sciences gave him its prize for his paper on the comet of 1530, and in 1782 he was elected to membership of the academy. In 1791 he was employed, at the suggestion of the academy, to measure a portion of the arc of the meridian between Dunkirk and Barcelona, which the national convention had selected to form the basis of their new system of measures. He continued his observations at the Paris observatory after his return from Spain. Under the auspices of the French board of longitude he went once more to Spain to continue his measurements of the arc of the meridian, but he was taken ill soon after his arrival and died at Castellon. His publications were not numerous; they are papers chiefly on eclipses and the theory of comets, contributed to the *Transactions* of the academy of sciences, and to the *Connaissance du Temps* of which he was at one time editor.

MECHANICAL CALCULATION. See CALCULATING MACHINE, *ante.*

MECHANICAL POWERS—MACHINES. Machines are instruments interposed between the moving power and the resistance, with a view of changing the direction of the force, or otherwise modifying it. Machines are of various degrees of complexity; but the simple parts, or elements of which they are all composed, are reducible to a very few. These elementary machines are called the MECHANICAL POWERS, and are usually reckoned as six in number, three being primary—viz., the *lever, inclined plane,* and *pulley;* and three secondary, or derived from the others—viz., the *wheel-and-axle* (derived from the lever), the *wedge,* and the *screw* (both derived from the inclined plane). To these some add toothed-wheels. What is special to each machine will be found under its name; a few observations applicable to all may appropriately be made here. 1. In treating of the theory of the lever and other mechanical powers, the question really examined is, not what power is necessary to move a certain weight, but what power is necessary to balance it; what force at P, for instance (see LEVER, fig. 1), will just keep W suspended. This once done, it is obvious that the least additional force to P will suffice to begin motion. 2. In pure theoretical mechanics, it is assumed that the machines are without weight. A lever, for instance, is supposed to be a mere rigid line; it is also supposed to be *perfectly* rigid, not bending or altering its form under any pressure. The motion of the machine is also supposed to be without friction. In practical mechanics, the weight of the machine, the yielding of its parts, and the resistance of friction, have to be taken into account. 3. When the effect of a machine is to make a force overcome a resistance greater than itself, it is said to give a *mechanical advantage.* A machine,

however, never actually increases power—for that would be to create work or energy, a thing now known to be as impossible as to create matter. What is gained in one way by a machine is always lost in another. One lb. at the long end of a lever will lift 10 lbs. at the short end, if the arms are rightly proportioned; but to lift the 10 lbs. through 1 ft., it must descend 10 feet. The two weights, when thus in motion, have equal momenta; the moving mass multiplied into its velocity, is equal to the resisting mass multiplied into its velocity. When the lever seems to multiply force, it only concentrates or accumulates the exertions of the force. The descending 1 lb. weight, in the case above supposed, may be conceived as making 10 distinct exertions of its force, each through a space of a foot; and all these are concentrated in the raising of the 10 lb weight through 1 foot. The principle thus illustrated in the case of the lever holds good of all the other mechanical powers. 4. The object of a machine is not always to increase force or pressure; it is as often to gain velocity at the expense of force. See LEVER. In a spinning-factory, e.g., the object of the train of machinery is to distribute the slowly working force of a powerful water-wheel or other prime mover, among a multitude of terminal parts moving rapidly, but having little resistance to overcome. 5. The mechanical advantage of a compound machine is theoretically equal to the product of the separate mechanical advantages of the simple machines composing it; but in applying machines to do work, allowance must be made for the inertia of the materials composing them, the flexure of parts subjected to strains, and the friction which increases rapidly with the complexity of the parts; and these considerations make it desirable that a machine should consist of as few parts as are consistent with the work it has to do. 6. The forces or "moving powers" by which machines are driven are the muscular strength of men and animals, wind, water, electrical and magnetic attractions, steam, etc.; and the grand object in the construction of machines is, how, with a given amount of impelling power, to get the greatest amount of work of the kind required. See WORK, FOOT-POUND. This gives rise to a multitude of problems, some more or less general, others relating more especially to particular cases—problems, the investigation of which constitutes the science of applied mechanics. One of the questions of most general application is the following: If the resistance to a machine were gradually reduced to zero, its velocity would be constantly accelerated until it attained a maximum, which would be when the point to which the impelling force is applied was moving at the same rate as the impelling force itself (e.g., the piston-rod of a steam-engine) would move if unresisted. If, on the other hand, the resistance were increased to a certain point, the machine would come to a stand. Now the problem is, between these two extremes to find the rate at which the greatest effect or amount of work is got from the same amount of driving power. The investigation would be out of place here, but the result is that the greatest effect is produced when the velocity of the point of application is one-third of the maximum velocity above spoken of. The moving force and the resistance should therefore be so adjusted as to produce this velocity.

MECHANICS is the science which treats of the nature of forces and of their action on bodies, either directly or by the agency of machinery. The nature of force will be found treated of under FORCE. The action of forces on bodies may be in the form of pressure or of impulse, and may or may not produce motion. When the forces are so balanced as to preserve the body affected by them in a state of equilibrium their actions are investigated in that branch of mechanics called STATICS (q.v.); when motion is produced, they are considered under the head of DYNAMICS (q.v.) or *Kinetics*. The equilibrium and motion of fluids (including liquids and gases) is treated in the subordinate branches of HYDROSTATICS and HYDRODYNAMICS; though the special terms AEROSTATICS and AERODYNAMICS (for which the comprehensive term PNEUMATICS is often used) are sometimes employed to designate those portions of the science of mechanics in which the action of gaseous bodies is treated of

The science of mechanics owes very little to the ancient philosophers. They were acquainted with the conditions of equilibrium on the lever—discovered by Archimedes—and had reduced the theory of all the mechanical powers, except the pulley and the inclined plane and its derivatives, to that of the lever, but this was nearly all. Archimedes, starting from the principle of equilibrium on the lever, struck out the idea of a center of gravity for every body, and investigated the position of that point for the triangle, parabola, and paraboloid. Till the 16th c. the science remained stationary; Cardan, the marquis Ubaldi, and Stevinus—who was the first to give the correct theory of equilibrium on the inclined plane—then gave it a slight impetus, and the labors of Galileo, who introduced the expression of mechanical propositions in mathematical formulas, discovered the laws regulating the motion of falling bodies, and originated investigations concerning the strength of materials, placed the science on a broad and substantial basis. Torricelli, Descartes, Pascal, Fermat, Roberval, and Huygens, on the continent, and Wallis and Wren in England—the last three of whom simultaneously discovered the laws which regulate the collision of bodies—added each his quota to the *new science*, as mechanics was then called. In 1687 appeared Newton's *Principia*, in which the complete experimental basis of the subject was first laid down in a satisfactory manner, and the mechanical principles, which had before been considered to act only at the surface of the earth, were shown to rule and direct the motions of the planets.

Contemporary with Newton were Leibnitz and the two elder Bernouillis, James and John, who, besides contributing greatly to the advancement of the science, applied to it the newly-invented differential calculus, which was found to be a weapon of immense power. From this time a constant succession of illustrious men have prosecuted the study of theoretical mechanics, or of subjects connected with it. The chief names are Daniel Bernouilli, Euler, D'Alembert, Clairaut, Lagrange, Laplace. Lagrange's *Mécanique Analytique* not only systematized the subject but enormously increased its power and the range of its applications. The last great additions to the science are those made by Sir W. R. Hamilton (q.v.) under the name of the principle of *varying action*. The developments which this has received from Jacobi, Boole, Cayley, Liouville, Donkin, Bour, etc., form an extensive and difficult branch of applied mathematics, chiefly of the theory of simultaneous differential equations.

MECHANICS, ANIMAL. A moment's reflection shows that this subject is exhaustless, the application of forces and the variation in the mechanism being infinite, and this, without embracing molecular mechanics or kinematics, which would necessarily be involved in a minute study of the action of the nervous system. We must, therefore, content ourselves with a few brief general illustrations of the more obvious vital mechanical movements. The simplest examples are the hydromechanics of some of the lower infusoria, where the animal is propelled through its native element by the reaction of water forced out of a single orifice by the contraction of the simple cell which forms the body. Some of these minute animals have cilia which also serve as locomotive organs. Other hollow animals of a higher organization propel themselves through water in a similar manner, as those belonging to the sub-kingdom cœlenterata (q.v. in art. INVERTEBRATE ANIMALS). These animals are also provided with filamentary tentacles which have contractile properties, and the power of forming hooks or prehensile organs. The mechanism of the circulation in the *cydippe*, a cœlentrate belonging to the order Ctenophora is exceedingly interesting. It consists of a complex canal system, the tubular branches of which are lined by a ciliated endoderm for the purpose of keeping up within them the circulation of water. These animals, although no doubt assisted by the contractions of the body cavity, are propelled by certain organs called ctenophores, or parallel rows of cilia, which are arranged in comb-like plates longitudinally upon their globular or oval bodies. Some infusorial animals, as the rotifera or wheel animalcules, included in a higher sub-kingdom (annulosa), possess a highly mechanical organization, approaching somewhat, in that respect, the insects. The characteristic wheel organ consists of a retractile disk carrying numerous cilia which, by their successive rapid vibrations, produce the illusory appearance of a rotating wheel. The motions are regarded as having an action similar to that of a screw propeller, and as aiding in locomotion as well as serving to throw currents of water into the mouth. All the movements in these soft-bodied animals involve as complex mechanical principles as those which are exhibited in the action of muscles and tendons upon framework which serve as levers in the higher animals. The locomotion of fishes involves similar applications of force in the oblique manner in which the sides and tail fin are brought to act against the water in which they swim, and also in the position of the pectoral and other fins, which give direction, and are not—with the exception of the dorsal and caudal fins—organs of propulsion in ordinary swimming, as is sometimes supposed. When a fish is comparatively quiet he may change his position by the action of all the fins, and a backward motion is often produced by a paddle action of the pectoral and ventral fins. The oblique action of the sides of a fish against the water is of the same nature as that of a ship when tacking against the wind, or of the paddles of a screw propeller, or of an oar in sculling, or of a serpent in running through grass, and involves mathematical elements of all orders, from the simplest to the most complex.

The attempted solutions of the application of force in the locomotion of fishes, which represent the whole of the tail and latter part of the body as moving alternately from side to side, and producing alternate periods of retarding and of forward action, are founded upon erroneous views. No fish, not even the clumsiest, propels itself in accordance with such crude mechanical principles. The longitudinal line of the latter part of the body presents a number (depending upon the form and flexibility of the fish) of serpentine curves, of more or less depth, whose combined action produces (in the most rapid motions) an almost uniform forward propelling force, and in one direction, except when the fish curves its body for the purpose of turning, or altering its course. The body and tail fin do not oscillate in one curve, but the fin is always applied to the water in a direction which tends to propel the body forward, and its suppleness and flexibility are qualities given to it for this purpose. The complex mechanism displayed in the higher animals and in man is all the more interesting because of its involving the simpler principles of the mechanical powers, particularly the lever and pulley, as well as those of oblique action in fishes, which includes in its elements the principle of the inclined plane. The lines of force in the action of the muscles, as applied to the bones, undergoing, as they do, constant variation of direction, present, however, equally difficult mathematical problems if it is required to estimate the expenditure of power. The apparatus for mastication and deglutition in various classes of animals furnishes one of the most complex subjects of investigation, one, indeed, whose elements are, in their final results,

insolvable, on account of the constantly variable condition, quality, and quantity of food, involving, as it does, constantly varying applications of muscular force, and constantly varying capacity and form of the mouth and pharynx. Most of the movements are produced automatically, but the perfect adaptation of the mechanism to the required functions is none the less wonderful. The masticating apparatus in various animals is as various as the animals themselves, and one is adapted to the other so perfectly that many have adopted the idea that the development of the organism must have kept pace with the development of an appetite, or a change of circumstances. It is maintained by others, however, that there are facts in anatomy which render such progressive development hypotheses improbable; as, for instance, the arrangement of the superior oblique muscle of the eye-ball. One end of this muscle is attached to a part of the sphenoid bone at the bottom of the orbit; it then passes forwards to a cartilaginous ring or pulley which is attached to the frontal bone at the inner angle of the orbit, and becoming a rounded tendon it passes through this pulley and is then turned backward, becoming again muscular. It then expands into a broad band which is inserted into the sclerotic coat of the posterior and outer surface of the eye-ball. It is difficult to imagine how the force of an impending function, or any physiological want, could cause the development of such a piece of apparatus. It is so much of a contrivance, to all appearances, that the elements of design and of immediate creation cannot well be denied recognition. The internal mechanism of the eye-ball is held to afford as much evidence of design as that furnished by the superior oblique muscle. For the purpose of accommodating the eye to vision at different distances, among other provisions, the degree of convexity of the crystalline lens requires to be constantly changed. This is effected by the ciliary muscle, a circular organ situated at the outer border of the iris and at the junction of the cornea with the sclerotic coat. As examples of the "mechanical powers" in the mechanism of the human body, we find the cord and pulley in the arrangement of the superior oblique muscle of the eye, instanced above; the first kind of lever, that where the fulcrum is between the resistance and power, in the support of the head upon the *axis* (the upper cervical vertebra) and the depression of the occiput and elevation of the face by the contraction of the extensor muscles of the neck, and also in the arm when the extensor muscles act upon the olecranon process of the ulna. See SKELETON. The arm also affords an example of the third kind of lever when acted upon by the flexor muscles, the power being applied between the hand and elbow joint, which is the fulcrum. The raising of the body upon the toes is usually instanced as an example of the second kind of lever. It is evident, however, that if a person lies upon the back and places his toes against a resisting, but movable, object, and pushes it away, he will virtually be performing the same mechanical operation, as far as the foot is concerned, as when rising upon his toes, and the relations of the toe, the ankle joint, and the heel will be precisely the same; that is to say, the ankle joint will be the fulcrum, the application of the toe will be at the point of resistance, and the power will be applied by the tendo-achilles at the heel. In raising one's self upon the toes, therefore, the ankle joint is in reality a movable fulcrum. Moreover, the first and second kinds of lever are convertible into each other by making the resistance in the first kind stationary and causing the fulcrum to move. One of the most celebrated and elegant essays upon animal mechanism is the Bridgewater treatise for 1834, by Sir Charles Bell, on *The Hand, its Mechanism and Vital Endowments as Evincing Design.* The mechanical contrivance known as the toggle joint, sometimes spoken of as one of the mechanical powers, but which acts upon the principle of the inclined plane, is exemplified in the knee joint. When the knees are considerably bent it is difficult to raise a heavy weight, but as the legs become straighter the power over resistance becomes enormous. Of course the toggle, or knee joint, in this instance is moved by the application of muscles and tendons to levers whose arms (thighs and legs) are also the arms of the toggle joint. In reality the operation of raising the body from a sitting posture combines the principles of two mechanical powers, the lever and inclined plane, the hip forming a toggle joint as well as the knee. See TOGGLE JOINT.

The mechanics of aerial motion in birds furnishes one of the most interesting subjects of philosophical inquiry and physical research, and has been ably treated by the present duke of Argyle in a work called "The Reign of Law." See also in this cyclopædia the article on BIRDS. An examination of the anatomy of a bird is a source of never-ending admiration to the student of natural history. It reveals the most perfect adaptation of means to results—and results, too, which would seem impossible if one had never witnessed the phenomenon of aerial flight. To watch a bird—like one of the larger sea-gulls, poise itself without flapping its wings for a quarter of an hour or more, and when the wind is blowing, for an indefinite space of time, or as long as the bird can be seen, without descending from its altitude of several thousand feet, but floating aloft like a kite held by a cord, now rising with majestic motion, and now darting obliquely downward with immense speed—is one of the most fascinating of recreations. Scarcely less wonderful is the flight of insects, and perhaps none of the class possess the power in greater perfection than the common fly. See FLYING, *ante*, and INSECTS, *ante*.

MECHANICSBURG, a t. in s. Pennsylvania, incorporated 1826; in Cumberland co. in close proximity to the iron region, at the junction of the Cumberland valley railroad

and the Dillsburg branch; pop. '70, 2,569. It is 8 m. s.w. of Harrisburg, and 10 m. e. of Carlisle. It is the seat of the Cumberland Valley institute and the Irving college for women, and has excellent educational advantages in free schools, and a public library. It is lighted with gas and has an abundant water supply, and 5 hotels. Its industries are represented by manufactories of sashes and doors, paper mills, foundries, and spoke and bending works. It has a variety of stores, is the shipping point for iron ore, and a depot for supplies for the iron region.

MECHANICSVILLE, BATTLE OF, fought at the village of that name in Henrico co., Va., June 26, 1862. The battle-ground is within 7 m. of Richmond, and the intervening country was held by the confederates, commanded by gen. Lee in person, with his forces strongly concentrated immediately about the capital. Mechanicsville was occupied by the advance of the federal troops—a regiment of infantry and a battery. On the afternoon of the 26th the movement was begun by the confederate gen. A. P. Hill crossing the Chickahominy and advancing on the federals, who retired about a mile to a strongly intrenched position held by gen. Fitz John Porter, on the left bank of Beaver Dam creek. This movement uncovered the Mechanicsville bridge, and enabled gens. Longstreet and D. H. Hill to cross the river and march down its left bank with the design to attack the federal communications with the York river. But the federal position was discovered to be stronger than had been anticipated by gen. Lee when he made his plans; and the confederates found themselves exposed to a galling fire of artillery and musketry, the approaches to their line of battle being over open fields swept by their batteries. Continued assaults being unsuccessful, the confederates were forced to retire, with a loss of between 3,000 and 4,000; the federal loss being under 400, and only a portion of their force engaged. On the arrival of Stonewall Jackson the next day, the federal position was abandoned.

MECHERINO. See BECCAFUMI, DOMENICO.

MECHI, JOHN JOSEPH, b. London, 1802; of Italian descent; became in youth a clerk in a mercantile house, and in 1827 set up business for himself and opened a cutler's shop. Having obtained a patent for a "magic razor strop," he acquired a fortune from its sale, and in 1840 bought a farm of 170 acres at Tiptree Heath, Essex, making experiments in scientific agriculture. He was ridiculed for his experiments, but by deep draining, steam ploughing, and by liquid manures conveyed through subterraneous pipes, he made his farm before sterile very fertile and profitable, and indeed one of the notable farms in England. He has been an alderman and sheriff of London, and was a commissioner to the Paris exhibition of 1855. He has published *Letters on Agricultural Improvements; Experiments in Drainage; How to Farm Profitably.*

MECHITARISTS, a congregation of Armenian Christians, who reside on the island of San Lazaro at Venice, but who have also obtained a footing in France, Austria, Turkey, Russia, etc. They derive their name from MECHITAR (i. e., the Comforter) DA PETRO (born 1676, died 1749), who, in 1701, founded at Constantinople a religious society for the purpose of diffusing a knowledge of the old Armenian language and literature. Subsequently, the Mechitarists removed to the Morea, and thence, on the conquest of that portion of Greece by the Turks in 1715, to San Lazaro, which was granted to them by the Venetian government.—The Mechitarists acknowledge the supremacy of the Roman pontiff. Their most useful occupation is printing the classic writings of Armenian literature; their additions are universally admitted to be the best and most correct. They also issue a *journal*, which is much read throughout the Levant.—Compare Boné, *Le convent de St. Lazare à Venise, ou Histoire succincte de l'Ordre des Méchitaristes Arméniens* (Paris, 1837).

MECH'LIN. See MALINES.

MECKEL'S GANGLION, or SPHENO-PALATINE GANGLION, the largest of the four sympathetic ganglia situated in the cephalic region, the others being the ophthalmic (q.v.), the otic (q.v.), and the sub-maxillary (q.v.). It lies in the spheno-maxillary fossa, close to the spheno-palatine foramen. It is triangular or heart-shaped, of a reddish gray color, and was first described by Meckel. It is connected with the superior maxillary nerve, which is a branch of the fifth cranial nerve (sensory), with the seventh cranial nerve, called the facial (motor), and with the carotid plexus (sympathetic) through the vidian nerve. Its branches are divided into four groups: 1. Ascending, passing to the orbit of the eye; 2. Descending, passing to the palate; 3. Internal, passing to the nose; 4. Posterior, passing to the pharynx.

MECKLENBURG, a co. in s.w. part of North Carolina, bordering at the s. on South Carolina, and w. on Catawba river; 650 sq.m.; pop. '70, 24,299, since considerably increased. The surface is hilly, and there are large forests, but a great part of the soil is productive—cotton, grass, and Indian corn being the staples. Granite and gold are found; the amount of the latter obtained in a year, according to the census of 1870, is over $60,000. At Charlotte, situated almost exactly in the center of the county, several important railroads form a junction. These are the Atlanta and Charlotte (part of the Piedmont air line), Charlotte, Columbia and Augusta, Atlantic, Tennessee and Ohio, and the North Carolina railroads. At the outbreak of the war of independence, the inhabitants of this region distinguished themselves for their ardent patriotism, and as being the

first community in the country formally to renounce allegiance to the British crown, which they did in May, 1775.

MECKLENBURG, a co. in s. central Virginia, bounded on the s. by North Carolina; drained by the Meherrin river, which forms its n. boundary, and also by the Roanoke; 650 sq.m.; pop. '80, 24,611. The surface is rolling and broken, but remarkably fertile. The chief products are tobacco, Indian corn, and wheat. Of tobacco there were over 2,000,000 lbs. raised in 1870. Granite quarries are found in the district. It is intersected by the Roanoke Valley railroad. Capital, Boydton.

MECKLENBURG DECLARATION OF INDEPENDENCE. This is a document sufficiently near in tenor to the declaration of the continental congress to warrant the people of North Carolina in claiming priority of action; but that action was by only one colony, indeed, by the citizens of one county—the other by all the colonies in perfect harmony. The statement generally accepted in the state is that at a public meeting in Charlotte, Mecklenburg co., held May 20, 1775, a series of resolutions was adopted, and a copy is produced. Other accounts date the meeting May 31. The tenor of the resolutions is in harmony with the declaration of July 4, 1776; but that must have been true of all public declarations of the people then in rebellion.

MECK'LENBURG-SCHWERIN, a grand duchy of northern Germany, bounded on the n. by the Baltic, e. by Pomerania, s. by Brandenburg, and w. by Lauenburg. The area is about 5,136 sq.m., and the pop. '75, 553,734. Mecklenburg-Schwerin is watered by several rivers, the most important of which are the Elbe and the Warnow, and has a great many lakes and ponds, yielding an abundant supply of fish. The country is generally flat, although here and there intersected by low ranges of hills, and its surface is still extensively covered with wood, notwithstanding the great clearings which have been made in the forests during the present century. Near the sea, tracts of sand and morass cover large areas; but on the whole the soil is of a good quality, and well adapted for the growth of corn or the rearing of cattle, which constitute the principal native industry. There is considerable commerce through Warnemünde (Rostock) and Wismar; there were in 1875, belonging to the two ports, 426 vessels, with a burden of 113,656 tons. The grand duchy is divided into the circles of Schwerin, Güstrow, Rostock, and Wismar. The capital is Schwerin. The central and s.e. districts are the most densely peopled. The people of both the Mecklenburg duchies (Schwerin and Strelitz) are for the most part of Slavonic origin, but amalgamation with their Saxon neighbors has largely Germanized the original race. The predominating form of religion is the Lutheran, Roman Catholic and other churches numbering about 1100, while there are upwards of 3,000 Jews. Much has been done of late years in extending the educational organization of both duchies, although the lower classes do not yet enjoy as many advantages as in some other districts of Germany. Besides the university at Rostock (q.v.), there are five gymnasia, and numerous burgher, parochial, and other schools. The troops of Mecklenburg-Schwerin number in time of peace 2,700 men, and when on a war-footing, 5,380 men. The principal towns are the capital Schwerin, Ludwigslust, Rostock, Güstrow, and Wismar. The grand duke, whose powers are limited by a mixed feudal and constitutional form of government, has the title of royal highness, and is styled prince of the Wends, and of Schwerin and Ratzeburg, count of Schwerin, and lord of Rostock, Stargard, etc. The two Mecklenburg duchies have provincial estates in common, which meet once a year, alternately at Malchin and Sternberg. This united chamber consists of 684 landowners and the representatives of 47 provincial boroughs, while the country people have no representation. There is no general budget for Mecklenburg-Schwerin.; there are three entirely distinct systems of finance. The budget of the first system, called the administration of the sovereign, is estimated at about 12,000,000 marks; the second, the states administration, has but small resources to dispose of: the ordinary budget of the common administration of the sovereign and the states was, for 1876–77, about 2,000,000 marks. The public debt is upwards of 43,000,000 marks. Mecklenburg-Schwerin has two votes in the federal council, and six representatives in the imperial diet.

History.—The Mecklenburg territory, anciently occupied by Germanic, and afterward by Slavonic tribes, was finally subdued, in the 12th c., by Henry the lion, duke of Saxony, who, after thoroughly devastating the country, and compelling the small number of inhabitants remaining after the war to adopt Christianity, restored the greater part of the territory to Burewin, the heir of the slain Slavonic prince Niklot, and gave him his daughter in marriage. The country at that period received its present designation from its principal settlement, Mikilinburg, now a village between Wismar and Bruël. In 1349 it was elevated into a duchy by the emperor Charles. Duke Johann Albrecht introduced the Protestant doctrines in 1550, and his grandsons, Wolf-Friedrich and Johann Albrecht, founded the lines of Mecklenburg-Schwerin and Mecklenburg-Güstrow, which were, however, deprived of the ducal title in 1627, in consequence of their adhesion to the Protestant cause, when the imperial gen. Wallenstein was proclaimed duke of all Mecklenburg. In 1632 Gustavus Adolphus of Sweden restored his kinsmen, the deposed dukes, to their domains. After various subdivisions of the ducal line into the branches of Schwerin, Strelitz, and others, and the successive extinction of several of these collateral houses, the imperial commission, which met at Hamburg in

1701, brought about the settlement of a family compact, by which it was arranged that Schwerin and Güstrow should form one duchy, and Strelitz, with Ratzeburg and Stargard, Mirow and Nemerow, another independent sovereignity. After this, very few events of importance occurred till the accession in Schwerin, in 1785, of Friedrich Franz, who obtained the title of grand duke in 1815, and died in 1837, after a long reign, which he had made highly conducive to the internal welfare and external reputation of his hereditary dominions. The reign of Friedrich Franz II., who succeeded his father, Paul Friedrich, in 1842, was disturbed by a contest between the nobles and the burgher and equestrian landowners, the former arrogating to themselves the exclusive right of electing members into the equestrian order, nominating to benefices, and monopolizing other prerogatives of the ancient feudal nobility. The revolutionary excitement of 1848 gave a fresh stimulus to the popular ferment, and the disturbances could only be quelled by the intervention of Prussian troops. Both as members of the north German confederation and of the empire, the two duchies have maintained their internal constitution very much on the old footing.

MECKLENBURG-STRELITZ, a grand duchy of Germany, composed of two distinct portions of territory, viz., Stargard (by far the larger division, lying to the e. of Mecklenburg-Schwerin) and the principality of Ratzeburg (between Mecklenburg-Schwerin and Lauenburg), and comprising an area of rather more than 1000 sq.m., with a pop. '75, of 95,673. The country is flat, and similar in its physical characters to Schwerin, although, from its greater distance from the sea, the climate is less humid and less changeable. Strelitz, as already observed, has one joint representative chamber with Schwerin, but the lordship of Ratzeburg is not included in these estates, and is governed directly by the grand duke, who possesses very considerable private domains, from which he draws large revenues. The grand duke gave Ratzeburg a representative constitution in 1869. Mecklenburg-Strelitz has one vote in the federal council of the empire, and one representative in the diet. Mecklenburg-Strelitz has a debt of nearly 2,000,000 thalers. For the history of Mecklenburg-Strelitz, see preceding article.

The Mecklenburg duchies are essentially agricultural, 71 per cent of the inhabitants being employed on the land. In Mecklenburg-Schwerin 3,549 sq.m., and in Mecklenburg-Strelitz 670 sq.m. are under cultivation. The cattle of the duchies are considered the best in Germany; the horses especially are held in high esteem. The principal products are corn (which is exported to Scandinavian and British ports), cattle and sheep (which are sent to the markets of Hamburg and Berlin), wool, tobacco, butter, cheese, fish, fruit, hides, etc. The matricular contribution of both duchies towards imperial expenditure amounted in 1876 to 890,560 marks, the share of Mecklenburg-Strelitz being 132,364.

MECON'IC ACID ($C_{14}HO_{10},3HO+6Aq$), (from Gr. *mēcōn*, a poppy), an acid existing in opium, which, when good, yields from 6 to 8 per cent. of it. Both the acid and its salts assume a characteristic blood-red tint with persalts of iron, and this test, which is very sensitive, is employed by the toxicologist in searching for traces of opium. As, however, the alkaline sulphocyanides which exist normally in the saliva give a precisely similar tint with the persalts of iron, it is necessary to be able to distinguish the meconate of iron from the sulphocyanide of iron. A solution of terchloride of gold or of corrosive sublimate removes all doubt, by discharging the color of the sulphocyanide, but not affecting the color of the meconate of iron.

MECO'NIUM. This term is applied to the earliest matter discharged from the bowels of a new-born infant. It is of a brownish-green or almost black color, acid to test-paper, but devoid of odor, and rapidly putrefying on exposure to air. It is usually regarded as a product of the fœtal liver, but, according to Lehmann, it contains neither biliary acids nor bile-pigment. When examined under the microscope, it is found to consist of an abundance of cylinder epithelium of a beautiful green tint, of mucus-corpuscles, and of fat, with which there is a good deal of cholesterine.

MECOS'TA, a co. in w. Michigan, intersected by the Grand Rapids and Indiana railroad, and a branch of the Chicago and West Michigan, terminating at Big Rapids; 576 sq.m.; pop. '80, 13,973—10,479 of American birth, 317 colored. It is drained by the Muskegon and Chippewa rivers. Its surface is generally level, and extensively covered with forests of oak and pine, furnishing good building timber, with groves of sugar maple. Its soil is fertile and well adapted to wheat, other kinds of grain, and dairy products. Some attention is paid to the raising of stock. The Muskegon river supplies extensive water-power, and its leading industries are the manufacture of lumber, shingles, furniture, etc. Co. seat, Big Rapids.

MEDAL (Fr. *médaille*, Lat. *metallum*), a piece of metal in the form of a coin, not issued or circulated as money, but stamped with a figure or device to preserve the portrait of some eminent person, or the memory of some illustrious action or event. The study of medals, interesting in an historical and antiquarian point of view, is also important as illustrating the contemporary state of art. Like coins, medals belong to two periods, ancient and modern, separated by a wide interval. To the former belong those pieces issuing from the mint of ancient Rome, known as *medallions*, of the size of the aureus in gold, of the denarius in silver, and of the first or large brass in copper. They are gener-

ally supposed to have been struck on occasions similar to those on which medals are coined in modern times, on the accession of an emperor, on the achievement of an important victory, or as specimens of workmanship; but there are circumstances which countenance the belief that they were circulated as money. Medallions prior to the time of Hadrian are rare and of great value; one of the most beautiful and most famous being a gold medallion of Augustus Cæsar; from Hadrian to the close of the empire they are comparatively common. Of the Roman medallions, some were struck by order of the emperors, some by the senate; the latter may be known by being inscribed with the letters S. C. The larger bronze medallions are of admirable workmanship. In some of them a ring of bronze surrounds a center of copper, and the inscription extends over both metals. No portrait of a person not princely occurs on any ancient medal, a remarkable circumstance, considering the numerous contemporary statues of poets, historians, and philosophers. The *contorniati* are bronze medals marked with furrows (*contorni*), distributed at the public games, and apparently also in use as money. Numerous medals and medallions were struck in the Greek provinces of the Roman empire, of less substance and thickness, for the most part, than those of Rome. The Sicilian medals are of very fine workmanship, particularly one with a head of Ceres, and on the reverse a Victory crowning a figure in a car.

Modern medals begin in the 14th c., but few were struck prior to the 15th. Portraits of non-princely persons are freely introduced after the 16th century. An affectation of the classical takes from their value as illustrations of contemporary life. Most European countries possess a succession of medals from the 15th c. onwards. The best in point of design of the 15th c. medals are those wrought by Victor Pisani of Verona, and inscribed "Opus Pisani Pictoris." The medals of the popes form an unbroken series from the time of Paul II., who filled the papal chair from 1464 to 1471. Those that purport to be of earlier popes are all known to be, in point of fact, of later date. The reverse generally bears the cross-keys and mitre, and the obverse the head of the reigning pope. Some of the medals of Julius II., Leo X., and Clement VII. have an especial value, as having been designed by Raphael and Giulio Romano, and engraved by Benvenuto Cellini. A 16th c. medal of Sicily is probably the first instance in modern times of the use of a medal as a vehicle of political satire; it is directed by Frederick II. against his adversary, Ferdinand of Spain, whose head is on the obverse, with the inscription, "Ferdinandus R. R. Vetus Vulpes Orbis;" and on the reverse a wolf carrying off a sheep, with "Jugum meum suave est et opus meum leve." Satirical medals were afterwards common in the Low Countries. A medal representing Van Heubingen, the Dutch ambassador, in the character of Joshua arresting the course of the sun, is said to have so exasperated Louis XIV., who was understood to be typified by that luminary, as to cause the whole hostile force of France to be brought against Holland. Some of the Dutch medals are noted for the elaborate views, maps, and plans engraved on them. France produced few medals prior to the time of Louis XIV.; but there is a series illustrative of the chief events in the life of the Grand Monarque, and another devoted to the career of the first Napoleon. The Spanish medals begin with Gonsalvo about 1500. Scotland produced one of the earliest of modern medals, struck by David II., perhaps during his captivity in England, and formed on the model of the nobles of Edward III. English medals only begin with Henry VIII., and from Edward VI. onward there is an unbroken succession of coronation medals. The Scottish gold coronation medal of Charles I. is the first medal struck in Britain with a legend on the edge. The medals of the commonwealth and Charles II. are by Simon; those of queen Anne record the achievements of Marlborough. Medals, in connection with numismatics (q.v.), are treated of by the various writers on that subject.

Medals in the present day are conferred by the sovereign as marks of distinction for eminent worth or noble conduct, more particularly for naval and military services. Such medals of honor are seldom of great intrinsic value, their worth depending merely on the associations connected with them. They have ribbons attached, with clasps or small bars, each of which bears the name of a particular action. The Waterloo medal is of silver, with the head of George IV. (Prince regent), a winged Victory, and the words "Waterloo," "Wellington;" it hangs from a crimson ribbon, with a narrow stripe of blue near each edge. The Crimean medal, also of silver, is attached to a blue ribbon with yellow edges when worn for service in the Crimea, and to a yellow ribbon with blue edges when for service in the Baltic. Good-service medals of silver were instituted in 1830 and 1831, and rules formed for their distribution among meritorious sailors, soldiers, and marines. The naval medal is worn suspended from a blue, and the military from a crimson ribbon. There are also various British medals which have been conferred for services in the Peninsula, India, etc. On every medal is engraved the name, rank, etc., regiment or ship of the recipient of it. Medals and decorations do not seem to have been ever conferred as rewards in the army or navy prior to the commonwealth. The French military medal and the Sardinian war-medal were some time ago bestowed to a large extent on British officers, soldiers, seamen, and marines. The former exhibits the effigy of Napoleon III., surmounted by an eagle, and is worn from a yellow ribbon with green borders; the latter is charged with the cross of Savoy, and suspended from a sky-blue ribbon. No medal of honor from any foreign sovereign is allowed to be worn or accepted by any British subject without the sanction of the queen.

MEDALLION (in architecture), a circular panel containing a bas-relief of a head, bust, figure, etc.

MEDARY, SAMUEL, 1801–64; b. Penn.; received only a common-school education, and became a printer. He entered into politics, and sustained gen. Jackson; and for many years edited the *Ohio Statesman*. From 1857 to 1860, he was governor of the territories of Minnesota and Kansas, in each case for two years. He had previously been offered the position of minister to Chili, which he refused. He established the *Columbus Crisis*, at Columbus, O., and continued to conduct and edit it until his death. In 1869 his many personal and political friends erected a costly and beautiful monument to his memory.

MEDE, or MEADE, JOSEPH, 1586–1638; b. Berden, Essex, Eng. While a boy at school at Wetherfield he accidentally, on a visit to London, picked up a copy of Bellarmine's Hebrew grammar, and soon acquired a good knowledge of the language. He graduated at Christ church, Cambridge, in 1610. His learning at this time is spoken of as extraordinary. His first work was *De Sanctitate Relativa*, addressed to bishop Andrews who requested him to become his domestic chaplain. Declining this he was soon afterward made a fellow of his college, and reader of the Greek lectures on Sir Walter Mildmay's foundation, which office he occupied till his death. In 1618 he took his degree of B.D. The provostship of Trinity college, Dublin, offered him twice, in 1627 and 1630, through the influence of archbishop Usher, he declined, preferring the retirement of college for study. He was distinguished for meekness, modesty, and liberality, devoting the tenth of his small income to charitable and pious purposes. His learning was various and profound. He was well acquainted with mathematics, medicine, the various branches of natural science, history, antiquities, and the literature and sciences of the East. His chief work was *Clavis Apocalyptica*, translated into English in 1643, the first rational attempt, according to bishop Hurd, to interpret the apocalypse. His complete works were collected after his death in one folio volume by Dr. Worthington, with a life of the author.

MEDE'A, in Grecian legend, a famous sorceress, the daughter of Aëtes, king of Colchis, and of the Oceanid Idyia, or of Hecate. She married Jason, the leader of the Argonauts (q.v.), and aided him in obtaining the Golden fleece. Jason, after his return home, being desirous to be revenged on Pelias for the murder of his parents and his brother, Medéa persuaded the daughter of Pelias to cut him in pieces and boil him, in order to make him young again. Jason and she fled to Corinth, where, after she had been his wife for ten years, he repudiated her, to marry Glauce or Creusa, and Medéa, in revenge, sent by her son to her rival a poisoned robe or diadem, the virulence of which destroyed both her and her father. Medéa then slew the children which she had borne to Jason, and fled to Athens in a chariot drawn by dragons, which she obtained from Helios. There she was received by Ægeus, to whom she bore Medos; but afterwards being compelled to flee from Athens, she took Medos to Aria, the inhabitants of which were thenceforth called Medes. She finally became immortal, and the spouse of Achilles in the Elysian fields. Such is the classic legend, which afforded material for many productions of the tragic muse, and subjects for the painter and sculptor, and which even in modern times has been so employed.

MEDE'AH, a t. of Algeria, 43 m. s.s.w. of the town of Algiers, consists of a walled town and suburbs. It is considered as, on the whole, one of the finest towns in Algeria. There is an Arab market held every Friday. Under the Romans, Medéah was a military station. Pop. within the walls, 2,100; without the walls, 5,700; total, 7,800.

MEDELLIN, a city of the United States of Colombia, South America, in the province of Antioquia, and 50 m., s.e. of the city of that name, between the ranges of the central and western Cordilleras. It is a beautiful town, and, placed at an elevation of about 5,000 ft. above sea-level; its climate is exceedingly pleasant. It is the entrepot of trade for the surrounding district, and contains a pop. estimated at 15,000.

MEDEOLA. See INDIAN CUCUMBER.

MEDFORD, a t. in Massachusetts, on the Mystic river at the head of navigation and near the Mystic pond, which forms a part of its boundary and supplies water to certain sections of Boston; pop. '80, 7,573. It is 4 m., n.w. of Boston, on the Boston and Maine, and Boston, Lowell, and Nashua railroads, and is the seat of Tufts college (Universalist). It has a public library, a savings bank, 2 newspapers, a reading room; excellent public schools, 7 churches, and a town house. It has many beautiful residences occupied by men of business in the city of Boston, and has delightful drives and lovely scenery. The celebrated Medford rum is manufactured here, and it has manufactories of tin ware, harness, leather, crackers, woolen goods, cotton cloths, buttons, carpets, oil silk, boots and shoes, and bricks. In former times it numbered ship-building among its industries.

MEDHURST, WALTER HENRY, an English missionary; 1796–1857; b. London; educated for the ministry, and, by appointment of the London missionary society in 1816, labored successfully in India, Malacca, and other Asiatic countries, and afterwards settled in Batavia, Java, where he remained eight years, performing missionary work also in Borneo. In 1845 he was sent to China, and settled at Shanghai. He had charge of the printing establishment, which before this had been worked at Batavia, but he now

removed it to Shanghai, and began to print sermons and tracts. For six years he performed mission work in the interior of China amid much peril. He was much opposed by the Romanists in the year 1847, yet 34,000 copies of various works were printed, and 500 tracts were weekly distributed. During this year delegates from several stations convened in Shanghai for the revision of the New Testament. In this work he was engaged till 1850, when he devoted his time to the Old Testament. In 1856 he returned to England in impaired health, and died three days after his arrival. He was a faithful missionary, and a distinguished oriental scholar. He was well versed in the Chinese, Japanese, Javanese, and other languages, besides Dutch and French, in all of which he wrote. His special works are: *China, its State and Prospects, with Especial Reference to the Diffusion of the Gospel; Dissertation on the Theology of the Chinese; The Chinese Version of the Scriptures; A Chinese Dictionary; A Japanese and English Vocabulary; Dictionary of the Hokkien Dialect; Translation of a Comparative Vocabulary of the Languages of China, Corea, and Japan; Notes on Chinese Grammar*; *Chinese Dialogues.* He was engaged also on the following works: *Chinese Repository*, 20 vols.; *Chinese Miscellanies*, 3 vols. He published also an *Account of the Malayan Archipelago*, and *A Glance at the Interior of China.*

ME'DIA, in ancient times, the name of the north-western part of Iran, which was bounded by the Caspian sea on the n., by Persia on the s., by Parthia on the e., and by Assyria on the west. The northern portion of the country is very mountainous; the s. is a rich and fertile tract. Media at present forms the Persian provinces of Azerbijan, Ghilan, Mazanderan, and Irak-Ajemi, and the northern portion of Luristan. The Medians were in language, religion, and manners very nearly allied to the Persians. After they had shaken off the yoke of the Assyrians, their tribes united about 708 B.C., according to the common account, chose Dejoces (Kai-Kobad) for their chief, and made Ecbatana their capital. His son Phraortes, or Arphaxad, subdued the Persians. Cyaxares (Kai-Kaous), the son of Phraortes, in alliance with Nabopolassar, king of Babylon, overthrew the Assyrian empire about 604 B.C., spread the terror of his arms as far as Egypt and the furthest bounds of Asia Minor, and vanquished the brigand hordes of Scythia, who had carried their ravages as far as Syria. He was succeeded by his son Astyage (Asdehak), who was deposed (560 B.C.) by his own grandson Cyrus (Kai-Khûsru), king of Persia; and from this time the two nations are spoken of as one people. Ecbatana, the capital of Medea, became the summer residence of the Persian kings. After the death of Alexander the great (324 B.C.), the N.W. portion (*Atropatene*) of Medea became a separate kingdom, and existed till the time of Augustus; the other portion, under the name of *Great Media*, forming a part of the Syrian monarchy. Medea was on several occasions separated from Persia. In 152 B.C. Mithridates I. took Great Media from the Syrians, and annexed it to the Parthian empire, and about 36 B.C. it had a king of its own, named Artavasdes, against whom Mark Antony made war. Under the Sassanian dynasty the whole of Media was united to Persia. It became, during the 14th and 15th centuries, the stronghold of the Turcoman tribes Kara-Koinlû, or "Black Sheep," and Ak-Koinlû, or "White Sheep."

In early times the Medes were a warlike race, possessed of an enthusiastic love of independence, and distinguished for their skill with the bow. They were also celebrated for their horsemanship, and it was from them that the Persians adopted this and other favorite exercises and acquirements. In subsequent times they appear to have become effeminated by luxury. (See the works of Xenophon, Strabo, and Ammianus.)

ME'DIATE, in the old German empire, a term applied to those lordships or possessions which were held by feudal tenure under one of the greater vassals, and so only *mediately* under the emperor as the supreme feudal lord. Many of the smaller states or lordships were gradually reduced to this condition as the neighboring greater states increased in power; and amidst the changes caused by the wars of the French revolution in 1803 and 1806, many small states were thus *mediatized*, in which the greater states found a sort of compensation for their losses in other quarters. The term continued to be employed even when the feudal sovereignty of the German empire did not exist. At the congress of Vienna, further mediatizations were effected; and at the present day the people of many of the smaller existing states are anxious for a similar change. The question of mediatization was one of those affecting the internal welfare of Germany which were most keenly agitated in 1848.

MEDIATOR, a term applicable to any person who endeavors to reconcile parties at variance. In theology it is employed to denote Jesus Christ, both with respect to his sacrifice of *atonement* (q.v.)—making God and man *as one* again, by satisfying divine justice, which otherwise demands the punishment of sinners—and with respect to his continual intercession (q.v.). The Roman Catholic church represents *saints* as mediators of intercession, although not of atonement; but this view is rejected by Protestants.

MEDICAL DEPARTMENT of an army, next to the commissariat, is the most important of all the non-combatant sections. The surgical treatment of the wounded in actual fighting, and still more the combat with disease engendered by crowding, unhealthy stations, and the reckless habits of the soldiery, necessitate a large medical staff; for, on an average of the whole army, it is found that the rate of sickness is at least triple that for the civil population.

In the British army every battalion, when at home or in the temperate zone, has a surgeon and an assistant-surgeon; when in India or the tropics, another assistant-surgeon is added. In addition to these officers, there are numerous staff medical officers at all stations, who have charge of detachments, hospitals, etc. The active list of the medical officers comprised, in 1879–80, 530 surgeons-general, deputy surgeons-general, surgeons-major, and surgeons. Besides these, there are between 400 and 500 medical officers employed with the army in India. The total estimate for medical establishments and services in 1879–80 was £266,200.

The medical department is governed by a director-general, who is a member of the war office, and has charge of the surgical, medical, and sanitary arrangements of the army. The special duties, pay, etc., of the several ranks will be found under SURGEON.

MEDICAL DEPARTMENT, in the navy, is only of less importance than the same department in the army, in that the sea-service is vastly more healthy than service upon land. After an action, the surgeon, of course, is in equal requisition in either case. In the British navy, the medical officers in active employ, in 1876, comprised 5 inspectors-general, 12 deputy inspectors-general, 81 fleet surgeons, 123 staff surgeons, and 195 surgeons. The pay of these officers ranges from £2 10s. a day for a senior inspector-general of hospitals and fleets, to 11s. a day for a junior surgeon.

MEDICAL DEPARTMENT IN THE U.S. ARMY AND NAVY. See UNITED STATES ARMY; UNITED STATES NAVY.

MEDICAL JURISPRUDENCE. See JURISPRUDENCE, MEDICAL.

MEDICAL PRACTITIONERS, in point of law, have lately been put on a new footing in many respects. The late statute (21 and 22 Vict. c. 90), and later ones, gave the body of medical practitioners powers of self-government, so far as regards qualification and training. All duly qualified persons are now registered, and the register is published, though it is not in strict law compulsory on practitioners to register themselves, the only disadvantage being that those who are not registered cannot fill certain offices, and cannot sue for their fees. Before the late acts, physicians were on the same footing as barristers, and could not sue for their fees, these being considered an honorarium which ought to be paid beforehand, and, at all events, were not a legal debt. But the act remedies this defect as regards qualified registered practitioners. Another enactment of the recent statute, which was intended to put down quacks, but which is still found to be capable of evasion to some extent, was the giving of power to justices of the peace to punish with fine of £20 or imprisonment those who falsely pretend to be, or take, or use the name or title of a physician, doctor of medicine, licentiate in medicine or surgery, bachelor of medicine, surgeon, general practitioner or apothecary.

MEDICAL SCHOOL, NETLEY, an establishment for the technical education of medical officers for the British and Indian military service. Candidates are examined competitively in the ordinary subjects of professional knowledge; and, passing satisfactorily through that ordeal, are then required to attend, for six months, at the Military Medical school, where they go through practical courses of military hygiene, military and clinical-military surgery and medicine, and pathology with morbid anatomy. As the school is attached to the Royal Victoria hospital, which is the great invalid depot for the whole army, the students have ample opportunity of seeing theory exemplified in practice. The school comprises 4 professors with £850 a year each, 4 assistant-professors having £450 each, and usually about 40 medical candidates, who receive each 5s. a day and lodging-money. The annual cost of the whole establishment is about £7,900. See NETLEY.

MED'ICI, THE, who ranked among the first and most distinguished families of the Florentine republic, owe their earliest distinction to the success with which they had pursued various branches of commerce, and the liberal spirit in which they devoted their wealth to purposes of general utility. From the beginning of the 13th c., the Medici took part in all the leading events of the republic; and from the period when Salvestro de' Medici attained the rank of gonfaloniere in 1378, the family rose rapidly to pre-eminence, although the almost regal greatness which it enjoyed for several centuries is more especially due to Giovanni de' Medici, who died in 1429, leaving to his sons, Cosmo and Lorenzo, a heritage of wealth and honors hitherto unparalleled in the republic. With Cosmo (born 1389, died 1464), on whom was gratefully bestowed the honored title of "Father of his country," began the glorious epoch of the Medici; while from Lorenzo is descended the collateral branch of the family, which, in the 16th c., obtained absolute rule over Tuscany. Cosmo's life, except during a short period, when the Albizzi and other rival families re-established a successful opposition against the policy and credit of the Medici, was one uninterrupted course of prosperity; at once a munificent patron and a successful cultivator of art and literature, he did more than any sovereign in Europe to revive the study of the ancient classics, and to foster a taste for mental culture. He assembled around him learned men of every nation, and gave liberal support to numerous Greek scholars, whom the subjection of Constantinople by the Turks had driven into exile; and by his foundation of an academy for the study of the philosophy of Plato, and of a library of Greek, Latin, and Oriental MSS., he inaugurated a new era in modern learning and art. But although these merits must be conceded to him, it must not be

forgotten that while he retained the name of a republican form of government, and nominally confided the executive authority to a gonfaloniere and eight priori or senators, he totally extinguished the freedom of Florence. His grandson, Lorenzo the Magnificent (born Jan. 1, 1448, died April 8, 1492), who succeeded to undivided and absolute power in the state, after the murder of his brother Giuliano in 1478, pursued, with signal success, the policy of his family, which may be characterized as tending to ennoble individuals and debase the nation at large. He encouraged literature and the arts; employed learned men to collect choice books and antiquities for him from every part of the known world, established printing-presses in his dominions as soon as the art was invented, founded academies for the study of classical learning, and filled his gardens with collections of the remains of ancient art; but when his munificence and conciliatory manners had gained for him the affection of the higher and the devotion of the lower classes, he lost no time in breaking down the forms of constitutional independence that he and his predecessors had hitherto suffered to exist. Some few Florentines, alarmed at the progress of the voluptuous refinement which was smothering every spark of personal independence, tried to stem the current of corruption by an ascetic severity of morals, which gained for them the name of *piagnoni*, or weepers. Foremost among them was the Dominican friar Girolamo Savonarola (q.v.), whose eloquent appeals to the people in favor of a popular and democratic form of government, threatened for a time the overthrow of the Medici; but the jealousy of the Franciscans, and the vindictiveness of the papal court, averted their doom. Savonarola's martyrdom restored outward tranquillity to Florence, and left the Medici in undisturbed possession of absolute power. Pietro (born 1471), who succeeded his father Lorenzo in 1492, possessed neither capacity nor prudence; and in the troubles which the ambition of her princes and the profligacy of her popes brought upon Italy, by plunging her into civil and foreign war, he showed himself treacherous and vacillating alike to friends and foes. Lodovico Sforza, surnamed the "Moor," relying on the friendship which, from the middle of the 15th c., had prevailed between the Sforza family of Milan and the Medici, applied to him for assistance in establishing his claim to the duchy of Milan; but seeing that no reliance could be placed on Pietro, he threw himself into the arms of Charles VIII. of France. The result was the invasion of Italy by a French army of 32,000 men. Pietro, in hopes of conciliating the powerful invader, hastened to meet the troops on their entrance into the dominions of Florence, and surrendered to Charles the fortresses of Leghorn and Pisa, which constituted the keys of the republic. The magistrates and people, incensed at his perfidy, drove him from the city, and formally deposed the family of the Medici from all participation in power. Pietro, who was slain in 1503, while fighting in the French ranks, and several of his kinsmen, made ineffectual attempts to recover their dominions, which were not restored till 1512. The elevation of Giovanni de' Medici to the papal chair, under the title of Leo X., completed the restoration of the family to their former splendor, while the accession in 1523, of his cousin Giulio Medici to the pontificate as Clement VII., and the marriage of Catharine, the granddaughter of Pietro, to Henry II. of France, and her long rule over that country as regent for her sons, together with the military power of the cadet branch (descended from a younger brother of the "Father of his country"), threw a weight of power into the hands of the Medici, which rendered all attempts to maintain even a show of independence futile on the part of the Florentines. The faintest indication of republican spirit was at once crushed by the combined aid of the pope and Charles V.; and though the legitimate male line of Cosmo was extinct (with the exception of pope Clement VII.), the latter gave in 1529, to Alessandro, natural son of the last prince Lorenzo II., the rank of duke of Florence; and on his death, by assassination, without direct heirs, in 1537, raised Cosmo I., the descendant of a collateral branch, to the ducal chair. Cosmo, known as the great, possessed the astuteness of character, the love of elegance, and taste for literature, but not the frank and generous spirit that had distinguished his great ancestors; and while he founded the academies of painting and of fine arts, made collections of paintings and statuary, published magnificent editions of his own works and those of others, and encouraged trade, for the protection of which he instituted the ecclesiastical order of St. Stephen, he was implacable in his enmity, and scrupled not utterly to extirpate the race of the Strozzi, the hereditary foes of his house. His acquisition of Sienna gained for him the title of grand duke of Tuscany from Pius V.; and he died in 1574, leaving enormous wealth and regal power to his descendants, who, throughout the next half century, maintained the literary and artistic fame of their family. In the 17th c., the race rapidly degenerated; and after several of its representatives had suffered themselves to be made the mere tools of Spanish and Austrian ambition, the last male representative of the line, Giovanni Gaston, died in 1737, and his only sister the Electress Palatine, the last of the Medici family, expired in 1743. In accordance with a stipulation of the peace of Vienna, the grand duchy of Tuscany passed to the house of Lorraine.

MEDICI, CATHARINE DE'. See CATHARINE DE' MEDICI, *ante*.

MEDICI, MARIE DE'. See MARIE DE' MEDICI, *ante*.

MEDICI'NA, a t. of Italy, in the province of Bologna, 13 m. e. of the city of that name. Pop. 4,000. It is a thriving place, with considerable trade and large markets.

It has five churches and a theater, and is surrounded by walls. It occupies the site of the ancient city *Claterna*, of which some remains are still visible.

MEDICINAL PLANTS. Those plants of which some part or product is used in medicine, are very numerous, and belong to the most widely different orders. In some orders, particular properties are prevalent; other medicinal species are exceptional as to their properties in the orders to which they belong. Important properties and products are sometimes characteristic of a particular very limited group of species, as in the case of the *cinchonas*. Many medicinal plants are merely used by the people of the countries in which they grow, others—known as *officinal plants*—have a place accorded them in pharmacopœias and in the practice of educated medical practitioners. Many plants, however, are in high repute among the native physicians of India, which have not yet found a place in any western pharmacopœia, although a few of the most valuable have recently been introduced to notice in Europe. Of the plants which have been rejected from the pharmacopœias, but retain their place in rustic practice, some are really useful, and would be held in greater esteem if there were not preferable medicines of similar quality; others have owed their reputation merely to ridiculous fancies. Some medicinal plants are always gathered where they grow wild, others are cultivated in order to have them in sufficient abundance. This branch of gardening is carried on to a greater extent at Mitcham, near London, than in any other part of Britain. A great boon has very recently been conferred on mankind—so recently that it has scarcely yet begun to be enjoyed—in the introduction of *cinchona* (q.v.) trees into India, Ceylon, and Java, where their cultivation has been commenced with every prospect of success, a continued supply of Peruvian bark and of quinine, their increased abundance, and a diminution of their price, being thus secured.

Among the most valuable books on medicinal plants are Hayne's *Getreue Darstellung und Beschreibung der in Arzeneikunde gebräuchlichen Gewächse* (4 vols. Berlin, 1805–46); Nees von Esenbeck, Weihe, Walter, und Funke, *Vollständige Sammlung officineller Pflanzen* (3 vols. Düsseldorf, 1821–33).—Pereira's *Materia Medica* is also of very high excellence.

MEDICINE, History of. There is reason to believe that Egypt was the country in which the art of medicine, as well as the other arts of civilized life, was first cultivated with any degree of success, the offices of the priest and the physician being probably combined in the same person. In the writings of Moses there are various allusions to the practice of medicine amongst the Jews, especially with reference to the treatment of leprosy. The priests were the physicians, and their treatment mainly aimed at promoting cleanliness and preventing contagion. Chiron (q.v.), the centaur, is said to have introduced the art of medicine amongst the Greeks; but the early history of the art is entirely legendary. See Æsculapius.

With a passing allusion to the names of Pythagoras, Democritus, and Heraclitus, who in their various departments may be regarded as having advanced the art of medicine, we arrive at the time of Hippocrates (q.v.). The advance which Hippocrates made in the practice of medicine was so great, that no attempts were made for some centuries to improve upon his views and precepts. His sons, Thessalus and Draco, and his son-in-law, Polybius, are regarded as the founders of the medical sect which was called the Hippocratean or dogmatic school, "because it professed to set out with certain theoretical principles which were derived from the generalization of facts and observations, and to make these principles the basis of practice."

The next circumstance requiring notice in the history of medicine is the establishment of the school of Alexandria, which was effected by the munificence of the Ptolemies, about 300 years before the Christian era. Amongst the most famous of its medical professors are Erasistratus and Herophilus. The former was the pupil of Chrysippus, and probably imbibed from his master his prejudice against bleeding, and against the use of active remedies, preferring to trust mainly to diet and to the *vis medicatrix naturæ*. It was about this time that the empirics formed themselves into a distinct sect, and became the declared opponents of the dogmatists. The controversy, says Bostock, in his *History of Medicine*, really consisted in the question—how far we are to suffer theory to influence our practice. While the dogmatists, or, as they were sometimes styled, the rationalists, asserted, that before attempting to treat any disease, we ought to make ourselves fully acquainted with the nature and functions of the body generally, with the operation of medical agents upon it, and with the changes which it undergoes when under the operation of any morbid cause; the empirics, on the contrary, contended that this knowledge is impossible to be obtained, and, if possible, is not necessary; that our sole guide must be experience, and that if we step beyond this, either as learned from our own observation, or that of others on whose testimony we can rely, we are always liable to fall into dangerous and often fatal errors. According to Celsus, who has given an excellent account of the leading opinions of both sects, the founder of the empirics was Serapion of Alexandria, who was said to be a pupil of Herophilus. At this period, and for some centuries subsequent to it, all physicians were included in one or other of these rival sects, and, apparently, the numbers of the two schools were about equal.

We learn from Pliny that medicine was introduced into Rome at a later period than the other arts and sciences. The first person who seems to have made it a distinct pro-

fession was Archagathus, a Peloponnesian, who settled at Rome about 200 B.C. His treatment was so severe and unsuccessful that he was finally banished; and we hear of no other Roman physician for about a century, when Asclepiades, of Bithynia, acquired a great reputation. His popularity depended upon his allowing his patients the liberal use of wine and of their favorite dishes, and in all respects consulting their inclinations and flattering their prejudices; and hence it it is easy to understand the eminence at which he arrived. He was succeeded by his pupil Themison of Laodicea, the founder of a sect called Methodics, who adopted a middle course between the dogmatists and empirics. During the greater part of the first two centuries of our era the Methodics were the prepondering medical sect, and they included in their ranks C. Aurelianus, some of whose writings have come down to us. They then broke up into various sects, of which the chief were the Pneumatics, represented by Aretæus of Cappadocia, whose works are still extant; and the Eclectics, of whom Archigenes of Apamea was the most celebrated. But the most remarkable writer of this age is Celsus (q.v.), whose work *De Medicina* gives a sketch of the history of medicine up to his time, and the state in which it then existed. He is remarkable as being the first native Roman physician whose name has been transmitted to us. The names of Andromachus, the inventor of the theriaca, a preparation which was retained in our pharmacopœias until the close of the last century—of Pliny the naturalist—and of Dioscorides, cannot be altogether omitted in even the briefest sketch of the early history of medicine; but their contributions to its progress dwarf into insignificance when compared with those of Galen (q.v.), whose writings were universally acknowledged as ultimate authority until they were attacked and publicly burned in the 16th c. by the arch-quack, Paracelsus (q.v.). A learned and impartial critic, the late Dr. Aikin, after giving full credit to Galen for talent and acquirements, thus concludes: "His own mass and modern improvements have now in a great measure consigned his writings to neglect, but his fame can only perish with the science itself." As in the case of Hippocrates, his immeasurable superiority over his contemporaries seems to have acted as a check to all attempts at further improvement.

The first names of any renown that occur subsequently to the death of Galen (about 193 A.D.) are those of Oribasius, Alexander of Tralles, Ætius, and Paulus Ægineta, who flourished between the 4th and 7th centuries. They were all zealous Galenists, and those of their writings which are extant are for the most part compilations from their predecessors, and especially from their great master. With the death of Paulus the Greek school of medicine may be considered to have come to an end, for after his time no works of any merit were written in this language. The Arabian school was now beginning to rise into notice. The earliest Arabic writer on medicine of whom we have any certain account is Ahrum, who was contemporary with Paulus. The most celebrated physicians of this school were Rhazes (who flourished in the 9th c., and was the first to describe the small-pox), Avicenna (q.v.), (who flourished in the 11th c., and whose *Canon Medicinæ* may be regarded as a cyclopædia of all that was then known of medicine and the collateral sciences), Aulbucasis (whose works on the practice of surgery were for several ages regarded as standard authorities), Avenzoar, and Averrhoes (q.v.), (who flourished in the 12th c., and was equally celebrated as a physician and a philosopher). The works of Hippocrates and Galen, which, together with those of Aristotle, Plato, and Euclid, were translated into Arabic in the 9th c., formed the basis of their medical knowledge; but the Arabian physicians did good service to medicine in introducing new articles from the east into the European materia medica—as, for example, rhubarb, cassia, senna, camphor—and in making known what may be termed the first elements of pharmaceutical chemistry, such as a knowledge of distillation, and of the means of obtaining various metallic oxides and salts.

Upon the decline of the Saracenic universities of Spain, which may date from the death of Averrhoes, the only medical knowledge which remained was to be found in Italy, where the school of Salerno acquired a considerable celebrity, which it maintained for some time, till it was gradually eclipsed by the rising fame of other medical schools at Bologna—where Mondini publicly dissected two human bodies in 1315—Vienna, Paris, Padua, etc. Contemporary with Mondini lived Gilbert, the first English writer on medicine who acquired any repute; and the next century gave birth to Linacre, who, after studying at Oxford, spent a considerable time at Bologna, Florence, Rome, Venice, and Padua, and subsequently became the founder of the London college of physicians. It was in this (the 15th) c. that the sect of chemical physicians arose, who maintained that all the phenomena of the living body may be explained by the same chemical laws as those which rule inorganic matter. Although the illustrations and proofs which they adduced were completely unsatisfactory, a distinguished physiological school of the present day is merging into a very similar view, with, however, far more cogent arguments in its support. The chemists of that age, with Paracelsus at their head, did nothing to advance medicine, except to introduce into the materia medica several valuable metallic preparations.

This period seems to have been prolific in originating new diseases. It is in the 13th, 14th, and 15th centuries that we hear most of leprosy and of the visitations of the plague in Europe. Until the 15th c. whooping-cough and scurvy were unknown, or, at all events, not accurately described; and it was towards the close of that century that syphilis was first recognized in Italy (from which country it rapidly extended over the

whole of Europe), and that the sweating sickness (*sudor anglicanus*) made its first appearance in this country.

In the 16th c., the study of human anatomy may be said to have been first fairly established by the zeal and labors of Vesalius (q.v.); and in this and the succeeding century we meet with the names of many physicians whose anatomical and physiological investigations materially tended, either directly or indirectly, to advance the science of medicine. This was the epoch of Eustachius, Fallopius, Asellius, Harvey, Rudbeck, Bartholin, Malpighi, Glisson, Sylvius, Willis, Bellini, etc. Chemistry was now separating itself from alchemy, and was advancing into the state of a science, and a combination was now formed between its principles and those of physiology, which gave rise to a new sect of chemical physicians, quite distinct from the sect represented two centuries previously by Paracelsus. They considered that diseases were referrible to certain fermentations which took place in the blood, and that certain *humors* were naturally acid, and others naturally alkaline, and according as one or other of these predominated, so certain specific diseases were the result, which were to be removed by the exhibition of remedies of an opposite nature to that of the disease. They were soon succeeded by the mathematical physicians, or the Iatro-mathematical school, of which Borelli, Sauvages, Keill, Jurin, Mead, and Friend were among the most celebrated. In proportion as this sect gained ground that of the chemists declined, while the old Galenists were fast disappearing. To these rival sects must be added that of the Vitalists, which originated with Van Helmont (q.v.), and which, with some modifications, was adopted by Stahl and Hoffmann. The greatest physician of the 17th c. was, however, unquestionably Sydenham (q.v.), who, though inclining toward the chemical school, did not allow his speculative opinions regarding the nature of disease to interfere with his treatment.

The most eminent teacher of medicine in the early part of the 18th c. was Boerhaave, who was elected to the chair of medicine at Leyden in 1709. Among the pupils of Boerhaave must be especially mentioned Van Swieten, whose commentaries on the aphorisms of his master contain a large and valuable collection of practical observations; and Haller (q.v.), the father of modern physiology; while amongst the most celebrated opponents of the Hallerian theory, that irritability and sensibility are specific properties of the muscular and nervous systems, must be mentioned Whytt and Porterfield, physicians of high reputation in Edinburgh, and the former professor of medicine in the university.

In the article upon Cullen (q.v.), so full an account is given of the doctrines of that celebrated physician that it is unneccessary to add more than that most of the distinguished physicians of the latter part of the 18th c. belonged to what may be termed the Cullenian school of medicine. His views were attacked with great acrimony by his former assistant, John Brown, the founder of the Brunonian system of medicine. In this country the views of Brown were regarded as too purely theoretical, and did not acquire any great popularity; but on some parts of the continent, and especially in Italy, they were very generally adopted, and became for a considerable time the prevailing doctrine in several of the leading medical schools. To supplement this meager outline of the progress of medicine in the 18th c., the reader is recommended to consult the biographical sketches of Monro, Blane, the Hunters, Jenner, etc.

If we exclude certain popular quackeries, we may regard the Brunonian as the last of medical sects. The present century may be considered as the epoch of physiological experiment and clinical observation. The efficient laborers in the field of medicine, during the last 60 years, have been so numerous that it would be impossible to notice, in this article, even those whom we deemed the most celebrated, while it would be invidious to attempt such a selection.

Our materia medica has received a large number of most important additions, among which may be especially noticed quinine, morphia, strychnine, iodine, and the iodides, the bromides, hydrocyanic acid, cod-liver oil, and chloroform. The physical diagnosis of disease has been facilitated to an extent far beyond what the most sanguine physician of the last century could have deemed possible, by the discovery and practical application of the stethoscope, the pleximeter, the speculum, the ophthalmoscope, and the laryngoscope; while chemistry and the microscope have been successfully applied to the investigation of the various excretions, and especially of the urine and its deposits.

The discovery of vaccination as a means of preventing small-pox, although made (see JENNER) at the close of last century, may be regarded practically as belonging to the present, since a considerable time elapsed before its value was generally recognized.

The true and certain diagnosis between typhus and typhoid (or enteric) fever is due to living physicians; and the discoverers of Bright's disease of the kidneys, and of Addison's disease of the supra-renal capsules, have only recently been lost to science.

The treatment of many diseases, especially those of an inflammatory nature, has been much modified, and in most cases improved, especially during the last quarter of a century. The victims to the lancet are far fewer than they formerly were, but if the patients of the present day run little risk of being bled to death, there is an occasional chance of their perishing from the too copious administration of brandy. The moral to be drawn by the unbiased observer of the depleting and the stimulating modes of treating inflammatory diseases such as pneumonia and pericarditis, is that nature will often effect a cure even in spite of the interference of too energetic physicians. It is estab-

lished beyond all question by the statistics which have been collected by an eminent living physician, that the progress of pulmonary consumption is retarded for an average space of three years by the judicious administration of cod-liver oil; due attention being, of course, paid to the general treatment of the patient.

MEDICK, *Medicago*, a genus of plants of the natural order *leguminosæ*, sub-order *papilionaceæ*, nearly allied to clover (q.v., *trifolium*), but distinguished from that and other kindred genera by the sickle-shaped, or, in most species, spirally twisted legume. The species, which are very numerous, are mostly annual and perennial herbaceous plants, with leaves of three leaflets like those of clover, natives of temperate and warm climates. A number of them are found in Britain, and many more in the south of Europe. They generally afford good green food for cattle, and some of them are cultivated like the clovers for this use, amongst which the most important is the PURPLE MEDICK or lucern (q.v., *M. sativa*). Besides this, the BLACK MEDICK, NONSUCH, or LUPULINE (*M. lupulina*), is one of the most generally cultivated. It receives the name black medick from the black color of the ripe pods, which are short, black, twisted, and arranged in oblong heads, and is often called yellow lucern, or yellow clover, from the color of its flowers. It is a common native of Britain. In habit and general appearance it is very similar to *trifolium procumbens*, or *T. filiforme*. In British husbandry it is now very generally sown in mixture with red clover and rye-grass, and is useful where a close turf is desired.

MEDIETA'TE LIN'GUÆ, JURY DE. See JURY.

MEDILL, JOSEPH, b. New Brunswick, 1823; while still quite young, removed to Massillon, O., studied law, and began his experience as a journalist in 1849, when he established a free-soil paper at Coshocton, O. In 1852 he was in Cleveland, where he founded the *Forest City*, a whig paper; and in 1854 was among those who organized the new republican party in Ohio. In 1855, in company with two partners, he bought the Chicago *Tribune;* and in 1874, after his return from a tour in Europe, he purchased a controlling interest in the paper and became editor-in-chief, a position which he continues to retain (1881). In 1870 Mr. Medill was a member of the Illinois constitutional convention; in 1871 he was appointed a member of the U. S. civil service commission; and in the latter year he was elected mayor of Chicago.

MEDI'NA (Arab. city), or, more fully, MEDINAT AL NABI (City of the Prophet), also called TABAH, TIBAH, etc. (the Good, Sweet, etc.), and mentioned by Ptolemy as Jathrippa: the holiest city throughout Mohammedanism, next to Mecca, and the second capital of Hedjaz in western Arabia, is situated about 270 m. n. of Mecca, and 140 n. by e. of the port of Jembo on the Red sea, and contains about 16,000 inhabitants (Burton). It consists of three principal parts—a town, a fort, and suburbs, of about the same extent as the town itself, from which they are separated by a wide space (the Munakha). Medina is about half the size of Mecca, and forms an irregular oval within a walled inclosure of 35 to 40 ft. high, and flanked by thirty towers—a fortification which renders Medina the chief stronghold of Hedjaz. Two of its four gates—viz., the Bab Al Jumah (*Friday gate*, in the eastern wall) and the Bab Al Misri (*Egyptian*)—are massive buildings with double towers. The streets, between fifty and sixty in number, are deep and narrow, paved only in a few places. The houses are flat-roofed and double-storied, and are built of a basaltic scoria, burned brick, and palm-wood. Very few public buildings of any importance are to be noticed besides the Great Mosque Al Haram (the Sacred), supposed to be erected on the spot where Mohammed died, and to inclose his tomb. It is of smaller dimensions than that of Mecca, being a parallelogram, 420 ft. long and 340 ft. broad, with a spacious central area, called El Sahn, which is surrounded by a peristyle, with numerous rows of pillars. The Mausoleum, or Hujrah, itself is an irregular square, 50 to 55 ft. in extent, situated in the s.e. corner of the building, and separated from the walls of the mosque by a passage about 26 ft. broad. A large gilt crescent above the "green dome," springing from a series of globes, surmounts the Hujrah, a glimpse into which is only attainable through a little opening, called the Prophet's Window; but nothing more is visible to the profane eye than costly carpets or hangings, with three inscriptions in large gold letters, stating that behind them lie the bodies of the prophet of Allah and the two caliphs—which curtains, changed whenever worn out, or when a new sultan ascends the throne, are supposed to cover a square edifice of black marble, in the midst of which stands Mohammed's tomb. Its exact place is indicated by a long pearly rosary (Kaukab Al Durri)—still seen in 1855—suspended to the curtain. The prophet's body is supposed to lie (undecayed) stretched at full length on the right side, with the right palm supporting the right cheek, the face directed towards Mecca. Close behind him is placed, in the same position, Abubekr, and behind him Omar. The fact, however, is that when the mosque, which had been struck by lightning, was rebuilt in 892 three deep graves were found in the interior, filled only with rubbish. Many other reasons, besides, make it more than problematic whether the particular spot at Medina really contains the prophet's remains. That his coffin, said to be covered with a marble slab and cased with silver (no European has ever seen it), rests suspended in the air, is a stupid story, invented by Christians, and long exploded. Of the fabulous treasures which this sanctuary once contained, little now remains. As in Mecca, a great number of ecclesiastical officials are attached in some capacity or other to

the Great Mosque, as ulemas, mudarisin, imaums, khatibs, etc.; and not only they but the townspeople themselves live to a great extent only on the pilgrims' alms. There are few other noteworthy spots to be mentioned in Medina, save the minor mosques of Abubekr, Ali, Omar, Balal, etc. The private houses, however, surrounded by gardens, fountains, etc., have a very pleasing appearance; and the city, although in its decay, is yet one of the busiest and most agreeable. Thirty medresses, or public endowed schools, represent what learning there is left in the city, once famed for its scholars.

MEDINA, a co. in n.e. Ohio. It is traversed by Black and Rocky rivers and Chippewa creek, and by the Atlantic and Great Western, and the Cleveland and Wheeling railroads; 425 sq.m.; pop. '80, 21,454—17,844 of American birth. The soil is undulating and shows much clay. All the common agricultural productions are staples, and coal is found in the region. There are manufactories of harnesses, lumber, and cheese.

MEDINA, a co. in s.w. Texas; 1175 sq.m.; pop. '80, 4,492—3,463 of American birth. The county, bounded on the n.e. by Medina river, is drained also by Rio Hondo and Seco creek. It is not particularly productive, water and timber being scarce. Stock-raising is the chief industry, and in 1870 there were over 40,000 head of cattle. Chief town, Castroville.

MEDI'NA DE RIO SECO (anc. *Forum Egurrorum*), a t. of Spain, in the province of Valladolid, 23 m. n.w. of the city of Valladolid, on the Sequillo, an affluent of the Douro. This place was a famous emporium in the 14th c., when its cloth and linen fairs were amongst the greatest in the kingdom; it is now a place of little or no importance whatever. There still exist some remains of its former greatness, in its arcades, arches, ruins of a palace, etc. In 1808 the town was given up to pillage by Bessières. Pop. 5,100.

MEDINA SIDO'NIA (Arab. *Medinatu-Shidunah*, "City of Sidon," so called by the Moors because they conjectured it to be the site of the Phenician *Asidon*), a city of Spain, 25 m. e.s.e. of Cadiz. It has a picturesque and splendid appearance at a distance; but within it is described as a "a whitened sepulcher full of decay." It is of Moorish origin, and contains a beautiful Gothic church and extensive ruins of a castle. The town gives the title of duke to the descendants of the famous Guzman the good, and is otherwise noted in Spanish history. Pop. 10,800, who carry on manufactures of earthenware.

MEDI'NET-EL-FAYÛM'. See FAYÛM.

MEDIOLA'NUM, the ancient capital of Gallia Cisalpina, now Milan. It lay along a little stream, whose modern name is the Olona, on a plain between the rivers Ticinus, now the Ticino, and Addua, now the Adda. It was said to have been founded by the Insubres, whose capital city it was, and who named it after a village in Transalpine Gaul, whence they had emigrated. It is first heard of in the time of the Gallic wars, but was of little importance, till, with the Insubres, it submitted to the Romans, 190 B.C. Its situation in the center of the plain of n. Italy made it a favorite place of residence, and by the time of Strabo it had gained some consequence. Its most prosperous period was in the 4th c., in the early part of which the emperor Maximian selected it for his residence. It was adorned with elegant public buildings, temples, theaters, baths, a mint, and in the latter part of the same century Ansonius ranks it as sixth among the cities of the empire. It was the headquarters of the Romans in their campaigns against the barbarians. Its prosperity continued till Honorius, in 403, withdrew to Ravenna, at the time of the Visigothic invasion under Alaric. It was sacked by Attila, but the Gothic kings re-established it as the imperial capital about 476. It was captured soon after by Belisarius, but in 539 it was recaptured by the Goths and Burgundians, and burned; and 300,000 of its inhabitants are said (almost incredibly) to have been massacred on this occasion. In the middle ages it became a great commercial city. See MILAN, *ante*.

MEDITA'TIO FU'GÆ, a phrase used in Scotch law to denote an intention to abscond from the jurisdiction of the ordinary courts. It is used chiefly in reference to debtors. Wherever a creditor in Scotland believes—i.e., can make an oath or affidavit that he has reasonable ground to believe—that the debtor is about to leave the country in order to evade payment of debts, he can obtain from a justice of the peace a warrant to apprehend the debtor. The consequence of this is that the debtor must either pay or give security, or remain in prison till the cause is tried. The process may be used either against natives or foreigners who have lived forty days in Scotland, but not where they are merely passing through the country on business or pleasure. The warrant may be executed on a Sunday as well as other days. It may also be executed within the sanctuary of Holyrood. Though creditors often avail themselves of this compulsitor to recover their debts, they are liable to an action if they maliciously and without cause procure the debtor's arrest; and if the debtor can show that he never intended, at the time in question, to leave the country, and that the creditor had no just ground to believe he so intended, an action of damages will lie.—In England and Ireland there is a similar process. See DEBTORS, ABSCONDING.

MEDITERRA'NEAN SEA, so named from its being almost entirely inclosed by the continents of Europe, Asia, and Africa, one of the greatest inland seas in the world, extends (inclusive of the sea of Marmora, but exclusive of the Black sea and sea of Azof)

to about 1,000,000 sq. miles. Its length, from e. to w., is about 2,326 m., its greatest breadth about 1080, but it is divided into two great basins by the approach of the European and African coasts in its middle. It is connected with the Atlantic ocean only by the straits of Gibraltar, through which a strong current continually flows into the Mediterranean. Another strong current also flows into it from the Black sea, which receives large supplies of fresh water, whereas the great rivers which fall into the Mediterranean itself are comparatively few; the principal being the Ebro, the Rhone, and the Po, from Europe; and the Nile, from Africa. It receives no large river from Asia. The evaporation from the surface of the Mediterranean is, on the contrary, greater than what takes place in the ocean generally, owing to the heat which proceeds from the African deserts, and the shelter which mountains afford from the cold winds of the north. The surface temperature, dependent on the intensity of solar radiation, is in summer about 5° above that of the Mediterranean. By the expeditions for the scientific exploration of the deep sea in 1869 and 1870 it has been ascertained that the effects of this surface-heating are limited to a depth of 100 fathoms; at every depth beneath this, even down to 1900 fathoms, the temperature of the Mediterranean, unlike that of the Atlantic, is *uniform*, and stands about 54° or 55°. This is, in fact, the *winter* temperature of the entire contents of the basin, from the surface downwards, and also the mean temperature of the crust of the earth in that region. In winter the temperature of the Mediterranean and the Atlantic approximate very closely. In consequence, probably, of the greater evaporation, the water of the Mediterranean, unlike that of inland seas in general, contains about one-sixth per cent more salt than the Atlantic ocean. Its specific gravity is almost everywhere greater than that of the Atlantic, being in the proportion of 1.0386 to 1.0283. Its color, when undisturbed, is a bright deep blue; but in the Adriatic a green, and in the Levant a purple tinge prevails, while the dark hue of the Euxine is indicated in its name of "Black sea." Different parts of the Mediterranean sea bear different names—as the Ægean sea, the Ionian sea, the Adriatic sea, or gulf of Venice, etc. Its northern coast is very much broken with bays and peninsulas, and abounds in harbors, affording the inhabitants of the south of Europe great advantages for commerce, of which the Mediterranean sea was the chief seat during all periods of history, till toward the close of the middle ages, when, after the invention of the mariner's compass, a spirit of maritime adventure sprung up, and the discoveries of the Portuguese and of Columbus led to the extension of commerce over the whole world. The commerce of the Egyptians, the Phenicians, the Greeks, and Romans, was almost entirely confined to the Mediterranean sea.

The depth of the Mediterranean sea is generally greatest in its western basin. In many places it is 3,000 ft. deep. Near Nice it is 4,200 ft. deep at a distance of only a few yards from the shore. In many places it is 5,000 ft. deep and more. The depth in the straits of Gibraltar is about 5,500 feet. It is highly probable that the coasts of Europe and Africa were once united here, and have been separated by some great convulsion; it is also supposed that land once stretched from Sicily to cape Bon in Africa, where now a ridge exists along which there is for the most part a depth of scarcely 200 ft., and in some places of little more than 40 ft., whilst on each side, at a short distance, the depth is more than 6,000 feet. The Mediterranean sea is subject to the w., n., and n.e. winds for more than two-thirds of the year, while in spring the s.e. and s.w. winds prevail. The most formidable of those winds which are peculiar to the Mediterranean sea is the *solano* or *levanter*. In the gulf of Venice the greatest tides rise about 3 ft., and in the Great Syrtis, 5 ft., but in most places the tides are scarcely observable. According to the measurements of Napoleon's Egyptian expedition (1799) the surface of the Mediterranean sea, in the neighborhood of Alexandria, was from 24 to 30 ft. lower than that of the Red sea at Suez; but more recent measurements have shown that the difference of level is inconsiderable, and that the mean level of the Red sea is at most 6 in. higher than the Mediterranean.

Of the 643 species of European sea-fishes, 444 inhabit the Mediterranean sea, some of which are peculiar to it. It has a greater number of species than the British and Scandinavian seas, but does not nearly so much abound in useful kinds. Tunny-fishing is extensively prosecuted on some parts of its coasts. It is rich in red coral, which is procured in great quantity on the coasts of Provence, of the Balearic Isles, and of Sicily, but particularly on the coasts of Bona and Barca in Africa.

The shores of the Mediterranean sea are in many parts subject to frequent earthquakes. Besides the existing active volcanoes of Etna, Vesuvius, and Stromboli, there are many evidences of recent volcanic action, and instances have occurred of islands suddenly upheaved by it, where volcanic fires have appeared for a short time.

MEDJIDIE, a Turkish order, instituted in 1852, and conferred after the Crimean campaign, to a considerable extent, on British officers. It has five classes; and the decoration, which differs in size for the different classes, is a silver sun of seven triple rays, with the device of the crescent and star alternating with the rays. On a circle of red enamel, in the center of the decoration, is the legend in Turkish, whose signification is "zeal, honor, and loyalty," and the date 1268, the Mohammedan year corresponding to 1852; the sultan's name is inscribed on a gold field within this circle. The first three classes suspend the badge around the neck from a red ribbon having green borders, and

the fourth and fifth classes wear it attached to a similar ribbon on the left breast. A star, in design closely resembling the badge, is worn on the left breast by the first class, and on the right breast by the second class.

MEDJIDIEH, a t. in European Turkey, called by the name of the sultan Abdul Medjid, and now the principal place in the Dobrudja. It was of little importance till after the Crimean war, when a large number of Tartars immigrated to Kustendji, 23 m. distant, and worked upon the railroad between the Danube and Kustendji. These and other Tartar immigrants afterwards settled at Medjidieh, and by 1862, the number of Tartar immigrants alone was estimated at 40,000. There are no trustworthy means for forming an estimate of its present size, but it has probably largely decreased.

MEDLAR, *Mespilus,* a genus of trees or shrubs of the natural order *rosaceæ,* sub-order *pomeæ,* having a 5-cleft calyx with leafy segments, nearly round petals, a large honey-secreting disk, and 2 to 5 styles, united together in the flower, but widely separated on the fruit, the upper ends of the bony cells of which are exposed. The COMMON MEDLAR (*M. Germanica*), a large shrub or small tree, spiny in a wild state, but destitute of spines in cultivation, is a native of the s. of Europe and of the temperate parts of Asia, but is a doubtful native of Britain, although it is to be seen in hedges and thickets in some parts of England. It has lanceolate leaves, not divided nor serrated, solitary large white flowers at the ends of small spurs, and somewhat top-shaped fruit, of the size of a small pear or larger, according to the variety. The Medlar is much cultivated in some parts of Europe, and is common in gardens in England, but it does not generally ripen well in Scotland without a wall. It is very austere, even when ripe, and is not eaten till *bletted,* when its tough pulp has become soft and vinous by incipient decay.

MEDLEY, JOHN, D.D.; b. England, 1804; educated at Oxford university, where he took the degree of B.A. with high honors at Wadham college in 1826, and the degree of M.A. in 1830. After taking orders in the church of England, he obtained, and for some years held, a living at Exeter, and was soon after made precentor of the cathedral in that town. In 1845 he was made bishop of the newly formed diocese of New Brunswick and was the first to hold that position.

MÉDOC. See FRENCH WINES.

MEDOWS, SIR WILLIAM, 1738?–813; b. in England; in 1756 entered the British army, in which he served for many years; first in Germany, then in the war with the American colonies, where he commanded the 55th regt., but was soon placed at the head of the 1st brigade of grenadiers and distinguished himself by his bravery at the battles of the Brandywine and St. Lucie. He afterward resided in India from 1781 to 1793; where he occupied several posts of responsibility, and was governor of Madrid from 1790 to 1792. His military renown was greatly increased by gallant conduct at the siege of Seringapatam and the rank of lieut.gen. was conferred upon him. After his return to England he for some time was governor of the Isle of Wight, and afterward succeeded Cornwallis as commander-in-chief in Ireland, (1801–03).

MEDUL'LA OBLONGA'TA. See BRAIN.

MEDULLARY RAYS. See EXOGENOUS PLANTS and PITH.

MEDUL'LARY SARCO'MA is one of the synonyms for that variety of cancer (q. v.) which is also known as encephaloid, cellular cancer, medullary cancer, fungus medullaris, etc. It grows more quickly, distributes itself more rapidly, and attains a more considerable bulk than any other form of cancer, tumors of this nature being often as large as a man's head, or even larger. Of all forms of cancer, it runs the quickest course, soonest ulcerates, is the most malignant, and causes death in by far the shortest time, often destroying life in a few weeks, or, at furthest, in a few months after its first appearance, unless it has been removed by an operation at an early stage.

When it ulcerates, fungoid growths form upon the surface; they are extremely vascular, and bleed on the slightest provocation. In this state, the disease has received the name of *Fungus hæmatodes.*

MEDULLA SPINALIS. See SPINAL CORD, *ante.*

MEDU'SA. See ACALEPHÆ, and GENERATIONS, ALTERNATION OF.

MEDUSA. See GORGO, or GORGON, *ante.*

MED'WAY, a river of England, rises near the northern border of the co. of Sussex, and, after a n.e. course of upwards of 50 m., it joins the Thames at Sheerness. At Penshurst, 40 m., from its mouth, it becomes navigable. The chief towns on its banks are Maidstone, Rochester, Chatham, and Sheerness. Large vessels do not ascend above Rochester bridge, but below that the river widens into an estuary, and forms an important harbor for the navy.

MEDWAY, a t. in Norfolk co., Mass., on the Charles river, and the Woonsocket division of the New York and New England railroad; pop. 3,721. It has 6 churches, 8 schools, 4 public halls, a library, a savings bank, 2 weekly newspapers, and manufactures of boots and shoes, brick, cotton and woolen goods, leather, organs, bells, etc.

MEEANEE, or MIYANI, a village in Sinde, Hindustan, on the Indus, 6 m. n. of Hyderabad, is celebrated as the scene of a great battle fought between sir Charles Napier and

the ameers of Sinde, Feb. 17, 1843. Sir Charles's force, composed partly of Europeans, and partly of natives, amounted to only 2,800 men; that of his foes 22,000, yet the latter were totally routed, losing in killed and wounded 5,000 men. Sir Charles's loss was only 256. The result of this victory was the conquest and annexation of Sinde.

MEEK, ALEXANDER BEAUFORT, 1814–65; b. S. C.; was a graduate of the university of Alabama; and having studied law, was admitted to practice at the bar of the state in 1835. At this time he inte rested himself in politics, and edited a democratic paper called the *Flag of the Union*. He served as a lieut. of volunteers in the war against the Seminoles in 1836. He was afterwards attorney-general of the state, and in 1839 edited a literary monthly at Tuscaloosa called the *Southron*. He was made county judge in 1842; in 1845 became a clerk in the office of the solicitor of the treasury in Washington; was U. S. district attorney for the southern district of Alabama 1846–50; and in 1853 was a member of the state legislature, having been also for 5 years associate editor of the *Mobile Daily Register*. In the legislature judge Meek distinguished himself by organizing and establishing the free-school system in Alabama. He was judge of probate in Mobile county in 1854; and in 1859 was again in the legislature, and held the office of speaker. He wrote and published several volumes of poems, sketches and other fugitive efforts, besides having compiled a history of Alabama. He was an enthusiastic and very able chess-player, and was one of the foremost contestants in the first chess tournament, held in New York in 1857, when he met on equal terms such players as Morphy, Paulsen, Marasche, Fiske, Thompson, etc.

MEEKER, a co. in central Minnesota, drained by the North Fork of the Crow river, on the St. Paul and Pacific railroad; 560 sq.m., pop. '80, 11,739—7,567 of American birth. The surface is diversified, and much of it heavily wooded with maple, elm, ash, and oak. The soil is fertile and produces large crops of wheat, oats, and Indian corn. There are a number of saw and flouring mills. County seat, Litchfield.

MEEKER, JOSEPH RUSLING, b. Newark, N. J., Apr. 27, 1827; educated at common schools in Cayuga county, N. Y. Early showed a taste for painting. After 3 years' study in New York, 1845–48, he went to Buffalo, opened a studio, and was an associate there with W. H. Beard and Thomas Le Clear, also artists. From 1852 to 1859 he worked at Louisville with moderate success, and in 1859 went to St. Louis. On the breaking out of the rebellion he joined the navy service as paymaster. While on a gunboat on the lower Mississippi river he first saw those weird swamp and lowland forest scenes from the sketches of which he has since made numerous paintings in a field all his own, with felicitous rendering of the dreamy languor in the hazy air of cypress swamps, and moss-draped groves of oak. At the close of the war he was one of the founders of the St. Louis art society, and thrice its president; also an active member of the St. Louis academy of fine arts. He is the writer of an article on Turner in the *Western Magazine* (Dec., 1877), St. Louis.

MEERA'NÉ, a prosperous manufacturing t. of Saxony, in the circle of Zwickau, 10 m. n. of the town of Zwickau. Until within the last few years, it was an unimportant, small country town; but it has recently increased rapidly in size and importance, through the development of its industrial resources. Its pop., in 1849, was 7,345; 1858, 11,147; 1861, 13,626; 1875, 21,277. The manufactories produce, almost exclusively, woolen and mixed fabrics; and employ about 15,000 looms, of which about 3,000 are in the town itself, and the rest elsewhere. There are upwards of 100 manufactories, the yearly products of which are estimated at upwards of £2,000,000. A large export trade is carried on with England, France, and America, three of the principal firms having set up establishments in New York. There are some large tanneries in Meerane. The town itself has within the last few years been very much improved.

MEER'MAN, GERARD, Baron, 1722–71, b. Holland; studied jurisprudence at Leyden, and soon acquired a reputation as a learned law writer. He held but two public offices, that of pensionary of Holland, to which he was nominated in 1748; and of envoy to England, whither he was sent in 1757. The rest of his life was spent in researches on law or the art of printing. On the latter subject he wrote his *Origines Typographicæ*, 1765, wherein he claimed for his countryman Lawrence Koster the honor of the invention of printing. His great legal work is the *Novus Thesaurus Juris Civilis et Canonici*, which appeared from 1751 to 1754, in 7 volumes.

MEERSCHAUM, a mineral existing in many parts of the world. In Europe, it is found chiefly at Hrubschitz in Moravia, and at Sebastopol and Kaffa in the Crimea; and in Asia it occurs abundantly just below the soil in the alluvial beds at Kittisch and Bursa in Natolia; and in the rocks of Eski-Hissar in the same district, it is mined so extensively as to give employment to nearly a thousand men. Meerschaum, from its having been found on the sea-shore in some places, in peculiarly rounded snow-white lumps, was ignorantly imagined to be the petrified froth of the sea, which is the meaning of its German name. Its composition is, silica, 60.9; magnesia, 26.1; water, 12.0. Almost all the meerschaum found is made into tobacco-pipes, in which manufacture the Germans have been for a long time pre-eminent. Vienna contains many manufactories, in which some very artistic productions are made: and pipes worth a 100 guineas, from the beauty of their designs, are by no means uncommon. The French pipe-makers have lately used meer-

schaum, and have lately displayed great taste in their works. When first dug from the earth, meerschaum is quite soft and soap-like to the touch, and as it lathers with water, and removes grease, it is employed by the Turks as a substitute for soap in washing. The waste in cutting and turning the pipes was formerly thrown away, but it is now reduced to powder, mixed into a paste, and compressed into hard masses, which are carved into inferior pipes.

MEERUT', MERUT, or MIRUT, a t., district, and division of British India. The town is the chief town of the district and province, and is on the Kalli Nuddi, about 42 m. n.e. of Delhi. Its most important edifice is the English church, a fine building, with an excellent organ, and large enough to accommodate 3,000 persons. The climate of Meerut is healthy. Pop. '71, 79,378. The cantonment is situated 2. m. n of the town; on the opposite side of the stream are quarters of the native infantry. Here, on May 10, 1857, the native troops revolted, shooting their own European officers, firing the bungalows, and massacring the European inmates without respect to age or sex. The *district* of Meerut has an area of 2,368 sq.m., and a pop. '71, of 1,273,914. The *division* of Meerut lies in the n.w. provinces; area, 10,947 sq.m.; pop. '71, 4,973,190.

MEETING, an assemblage of people called with a view to deliberate on some speci fied subject, or to accomplish some specified purpose. The proceedings begin with the choice of a chairman, or presiding officer, and consist in the proposing and seconding of resolutions, on which the voice or vote of the meeting is taken. The chairman, in addition to his deliberative vote, is often entitled to give a second or casting vote, in case of equality. Any number of persons may in this country assemble for any purpose not in itself illegal; but the use of force or violence, or any tendency towards it, may entitle the authorities to interfere with a meeting, as an unlawful assemblage. Meetings called, not officially, but by private arrangement, are looked on in the continent as a characteristically English institution; in most parts of the continent, the right of holding such assemblages is more or less restricted by law.

MEETING, is the name applied by the society of Friends to their various assemblies for worship and for the management of official business. 1. To their usual gatherings on several days of the week for worship, meditation and instruction. 2. The monthly meeting is an assembly of members from several contiguous congregations, charged with making provision for the poor and for the education of children; with the admission of persons desirous of joining the society; with giving attention to the proper performance of religious and moral duties among Friends; and with the administration of needed discipline. In this last duty is included the appointment of committees to see that the rules are observed and to settle difficulties among members by private admonition and counsel so as if possible to prevent their being brought before the meeting. And even when cases are introduced to the meeting similar committees are appointed to settle them informally if possible. In all disputes the practice of the society is to refrain from going to law. It therefore directs all its members to harmonize their differences by prompt and impartial arbitration. To the monthly meeting belongs the allowing and solemnizing of marriages. It keeps a record of marriages, births, and deaths among its members. 3. The quarterly meeting is composed of several monthly meetings. It receives answers from the monthly meetings to questions it had sent to them concerning the conduct of their members and of the care taken of them. The statements thus received are condensed into a report, also expressed in answer to inquiries previously received, sent by representatives to the yearly meeting. The quarterly meeting receives appeals from the judgment of monthly meetings and has supervision over their neglect of discipline and care. 4. The yearly meeting has the general superintendence of the society in the country in which it is established; and therefore as the accounts which it receives discover the state of inferior meetings, as particular exigencies require, or as the meeting is impressed with a sense of duty, it gives forth its advice, makes such regulations as appear to be requisite, or excites to the observance of those already made, and sometimes appoints committees to visit those quarterly meetings which appear to be in need of immediate advice. At the yearly meeting a sub-committee called the morning meeting is appointed to revise the official manuscripts prior to their publication and also to grant in the intervals of the yearly meeting certificates of approval to those ministers who "have a concern" to travel in the work of the ministry in foreign parts in addition to those granted by their monthly and quarterly meetings. Appeals from the quarterly meetings are heard by the yearly meetings. There are 10 such: in London, Dublin, New England, New York, Pennsylvania, Maryland, Virginia, the Carolinas, Ohio, and Indiana.—The QUARTERLY MEETING in the Methodist church is a general meeting, of the stewards, leaders, and other officers, for the purpose of transacting the general business of the "circuit" or "district." In the Methodist Episcopal church it is presided over by the "presiding elder," or by the minister in charge. Its special object, in addition to celebrating the love-feast, is to examine the spiritual and financial condition of the church.

MEGAC'EROPS, an extinct genus of animals found in the miocene formation of Colorado by prof. O. C. Marsh of Yale college. They belong, with other genera, *titanotherium*, *diconodon*, and *brontotherium*, to the family Brontotheridæ of Marsh, which have four nearly equal toes in the fore feet, and three in the hind feet, as in the tapirs. In size and conformation of skeleton they resemble the elephants, but they had shorter

limbs and probably no proboscis, but a tapir-like nose. Skull elongated, brain cavity very small, the cerebral hemispheres scarcely covering the olfactory lobes. A pair of horn cores is placed transversely upon the maxillary bones in both sexes. They belong to that section of the order of ungulates called *perissodactyls*, (q.v.).

MEGAC'EROS HIBERNICUS, or great-horned Irish elk, an extinct species of gigantic deer whose bones are found in the quaternary deposits of marl in the peat swamps of Ireland, and also of England, as well as in bone caverns. The largest were 11 ft. in height to the tips of the antlers, which were 12 ft. across. The females had no antlers. The bones were proportionately stronger than in living species, and the cervical vertebræ of the males were very heavy for the purpose of carrying the massive horns. The dentition was of the ordinary ruminant type. They are regarded as intermediate between the reindeer and fallow-deer, and their fossils are exclusively post-tertiary, but not extending to the historic period.

MEGADAC'TYLUS, a name given by prof. Edward Hitchcock to an extinct genus of bird-like reptiles whose fossils are found in mesozoic formations of the Connecticut valley. The leg bones of one of these were slender and hollow, and the walls thin and dense, as in birds. Its tracks were for a long time, with others in the same locality, regarded as those of birds.

MEGADERMA. See BAT, *ante*.

MEGALICHTHYS (Gr. great fish), a genus of fossil heterocercal ganoid fishes, so named from their large size, compared with the other fish of the period. They were covered with large strong rhomboid scales, composed externally of brilliantly polished brown enamel, usually granulated, as in the scutes of the recent crocodile. These scales have been found as large as 5 in. in diameter. The head was defended by similar strong plates, and the jaws were furnished with immense laniary teeth, of a size rarely attained, even in the largest modern reptiles, and so closely resembling them, that they were for some time considered as having belonged to some crocodilean animal. These teeth—specimens of which have been found measuring 4 in. long and two broad at the base—were smooth at the point, had a long furrowed root, and a hollow base, in which the new tooth was prepared. Numerous smaller teeth were scattered over the jaw among the large ones. The fish of this genus must have been the terror of the seas they inhabited. Their strong skeleton, large tail, powerful head, and ferocious jaws remarkably suited their carnivorous habits.

Three species have been described from the carboniferous strata of Edinburgh, Glasgow, and the center of England.

MEGALONYX. See MEGATHERIUM, *ante*.

MEGALOPOLIS, the later capital of Arcadia, in the Peloponnesus, was situated on the river Helisson, in the center of a spacious plain on the n.w. border of Arcadia. It is said to have been founded in 370 B.C.; being suggested by Epaminondas, after the battle of Leuctra and designed to become the capital and stronghold of the Arcadian confederation against Sparta. It occupied three years in building, and was then settled by drawing upon the population of 40 different towns. The number of inhabitants was insignificant in comparison to the size of the city, and the latter never rose to the height of importance that was anticipated for it. The Theban supremacy being overthrown, it was forced to ally itself to Macedonia, in order to strengthen itself against Sparta. In 222 B.C., the Spartan king, Cleomenes III. surprised the city, and a large number of its magnificent buildings were destroyed. Some of its inhabitants were put to the sword, and the remainder fled to Messene. Later on the fugitives returned and rebuilt their city, which, however, never after recovered its former importance. Megalopolis was the birthplace of the celebrated Greek gen. Philopœmen, who fought bravely in defense of the city against the Spartan king Cleomenes. Polybius, the Greek historian, was also a native of Megalopolis, his father being the head of the Achæan league after the death of Philopœmen. A statue in honor of Polybius was erected in his native city during his life.

MEGALOSAU'RUS (Gr. great lizard), a genus of fossil dinosaurians, or land-saurians, of gigantic size and carnivorous habits, whose remains occur in the rocks of the oolite period. The huge body of the animal was supported on four large and strong unguiculate limbs; specimens of the femur and tibia have been found measuring each nearly 3 ft., giving a total length of almost two yards to the hind leg; and a metatarsal bone 13 in. long shows that the foot had a corresponding magnitude. The sacrum was composed of 5 vertebræ, anchylosed together, as in the other dinosaurs. Buckland calculated that the megalosaurus must have been 60 or 70 ft. long; but it is not likely that a reptile raised so high above the ground would have its body and tail so large in proportion to its limbs, as in our modern lizards or crocodiles. There seems good reason for rather accepting Owen's more moderate estimate of 30 ft. as its whole length. A fragment of the lower jaw, containing several teeth in position, tells of its carnivorous habits. Only a single species has been referred to this genus. Its remains are abundant in the Stonesfield slate, in the lower oolite of Gloucestershire, and in the Wealden and Purbeck limestones.

MEGANTIC, a co. in Canada, Province of Quebec, intersected in the w. by the Grand Trunk railway; 745 sq.m.; pop. 18,878. Its surface is undulating and drained by lake St. Francis, lake Inverness, lake Joseph, and lake William, the Becancour river, and the River du Chene. Its mineral products are iron and copper, which are found in abundance. It has tanneries, grist and saw mill; and fulling mills. County seat, Leeds village.

MEG'APHONE, a combination of the speaking-trumpet and ear-trumpet, devised by Mr. Edison. It consists of two large funnels, each about 7 ft. long and 3½ ft. across the mouth, and connected at the smaller end with a flexible tube having a tip suitable to apply to the ear. Slight sounds may be heard at a distance of over 1000 feet. By the use of a large speaking-trumpet a conversation may be carried on between two stations two miles apart.

MEGAPODIDÆ, a family of birds, referred by some naturalists to the order *grallæ*, but more generally to the gallinaceous order, being regarded as allied to the curassows, etc. The feet are large and have large blunt claws. To this order belong the genera *megapodius* (see JUNGLE-FOWL), *leipoa* (q.v.), *talegalla* (q.v.), etc. The order is peculiar to New Holland and the neighboring islands.

MEG'ARA (MEGARIS, *ante*) was about 20 m. n.w. from Athens and built at the base of two hills, Caria and Alcathous, each defended by a citadel. Two walls, built by the Athenians during their protectorate over Megara, between 461 and 445 B.C., ran down from the city to its harbor, Nisæa. In the time of Pausanias, the Megarian capital had many temples and public buildings, of which only the most scanty ruins have been preserved. According to its local legends, the city was named for its founder, Megarus, a Bœotian, son of Apollo. Its walls, which were razed by Minos, were said to have been rebuilt by Alcathous, the son of Pelops. Hyperion, son of Agamemnon, is represented as the last king, after whose death the government became republican. In historic times the city seems to have been under the power of the Athenians, from whom it was wrested by Dorians from the Peloponnesus. It was now colonized by Messenians and Corinthians, and adopted Dorian institutions. At a time not definitely known it ceased to be subject to Corinth, and as an independent state rose to a high degree of power. It sent out many colonies, of which the most famous were Byzantium, Chalcedon, and the Sicilian Megara. It rivaled Athens as a naval power, and for a long time kept possession of Salamis, in spite of the continued efforts of the Athenians to recapture it. The government had originally been in the hands of the Dorian landed aristocracy, from whom it was usurped about 620 B.C. by Theagenes, who led the popular faction, and established himself as absolute ruler of the state. Upon his expulsion, soon after, a fierce contest took place between the democratic and aristocratic parties, of which Theognis, a bitter partisan of the latter, has given an account in his poems. After the Persian wars, Megara carried on hostilities with Corinth, against which she formed an alliance with Athens 461 B.C. But in 455 the Megarians repudiated the Athenian alliance, and put to death the Athenian garrison which had been stationed at Megara. In the seventh year of the Peloponnesian war the democratic party in Megara, fearing that the aristocratic faction would take advantage of the Lacedæmonian alliance to re-establish an oligarchy, resolved to surrender the city to the Athenians. An Athenian army captured Nisæa, but the arrival of Brasidas with a force of Lacedæmonians prevented the surrender of Megara. From this time Megara is but little heard of in history. A democratic form of government was re-established in 357; after the death of Alexander the great, the city passed into the control of Demetrius Poliocertes and Ptolemy Soter successively. Demetrius, the son of Antigonus Gonabas, captured and nearly destroyed it. It was afterwards partially rebuilt, and finally surrendered to the Romans under Metellus. Alone among the cities of Greece it was not restored by Hadrian; Alaric still further reduced it, and in 1687 the Venetians completely destroyed it.

MEGAR'IC SCHOOL. See EUCLID.

MEGARIS, a small mountainous region of Hellas, or Greece proper, bounded by Attica, Corinth, and the sea. It formed the north-eastern part of the isthmus of Corinth. The capital was MEGARA, famous amongst the ancients for its white-shell marble, and for a white kind of clay, of which pottery was made.—From Euclid, the philosopher, who was born at Megara about 400 B.C., the MEGARIC SCHOOL took its name.

MEGASTHENES (Gr., great strength), a name given by prof. J. D. Dana to a grand division of the higher mammals of a superior and powerful type. It includes the quadremana, carnivora, herbivora, and cetaceans. He has given the name *microsthenes* to inferior mammals, as the bats, insectivora, rodents, and edentates. There is a parallelism between these two divisions, the bats in the latter representing the monkeys in the former; the insectivora the carnivora; the rodents the herbivora, and the edentates the cetaceans. The marsupials and monotremes form a lower, or semi-oviparous division, while man forms the highest division, the archonts.

MEGAS'THENES, a Greek writer in the time of Seleucus Nicator, about 300 B.C. Seleucus sent him on a diplomatic mission to Sandrocottus, king of the Prasii, a people in India. There he spent a number of years, and on his return to Syria, gave a general historical and geographical account of India, including the first description of Ceylon.

His work is known only in such fragments of it as are quoted by Strabo, Arrian, and Elian. The former did not set a high estimate on the accuracy of Megasthenes. It is certain, however, that the works include much information in regard to the geography and social condition of Indian peoples previously entirely unknown to the Greeks.

MEGATHERIIDÆ, a family of extinct mammals of the order Edentata, named by prof. Owen, and containing several genera. Pictet gave it the name *gravigrades*, placing it between the sloths and the armadilloes. There are nine or more genera, 1 megatherium, 2 cœlodon, 3 lestodon, 4 megalonyx, 5 mylodon, 6 scelidotherium, 7 spherodon, 8 megalocnus, 9 myomorphus. See MEGATHERIUM, *ante*.

MEGATHE'RIUM (Gr. great beast), a gigantic extinct quadruped of the order Edentata, nearly allied to the sloth, found in the superficial stratum of the South American pampas. In structure, it is very near its modern representative, except that the whole skeleton is modified to suit the requirements of an immense heavy-boned and heavy-bodied animal, some 18 ft. in length and 8 ft. in height. The appellation tardigrade, which Cuvier applied to the sloth, cannot be given to the megatherium; its limbs were comparatively short and very strong, and the feet adapted for walking on the ground, approaching in this respect nearer to the allied ant-eaters, but with this peculiarity, that the first toe of each of the hind feet was furnished with a large and powerful claw, which was probably used as a digger to loosen roots from the soil, and enable the creature the more easily to overturn the trees on the foliage of which it browsed. The enormous development of the bones of the pelvis, the hind legs, and the tail, gave the animal great power when, seated on its hind legs and tail, as on a tripod, it raised its fore legs against the trunk, and applied its force against a tree that had already been weakened by having its roots dug up. The structure of the lower jaw seems to indicate that the megatherium was furnished with a huge prehensile tongue like that of the giraffe, with which it stripped the foliage from the trees.

The remains of several allied genera of huge edentata are associated with the megatherium in the pampas deposits. They form the family megatheriidæ of Owen, which includes mylodon, megalonyx, sceledotherium, etc., genera which are separated from megatherium chiefly from peculiarities in the dentition.

The modern sloth is a native of South America, and the fossil remains of these immense creatures, which represented it in the newer tertiaries, have been found only in this continent, the past and present distribution of the family being the same.

MEGERLE, ULRICH VON. See ABRAHAM A. SANCTA CLARA, *ante*.

ME'GRIM (Gr. *hemicrania*, the *migraine* of the French) is the popular term for neuralgia occupying one half of the head, or more commonly only the brow and forehead of one side. It is often periodical, coming on at a certain hour, lasting a certain time, and then entirely disappearing for a fixed interval. It may be induced by any cause that debilitates the system; it not unfrequently attacks women who have suckled their children too long; or it may be associated with hysteria; or it may arise, like ague, from marsh miasma; and sometimes no exciting cause can be detected.

When it is associated with anæmia (paleness and general debility), it should be treated with the preparations of iron, the shower-bath, nourishing food, and plenty of exercise in the open air. When it is strictly periodical, quinine in full doses should be tried (the bowels being previously well cleared out); and if the quinine fails, Fowler's solution of arsenic, given in small doses (three minims in a wine-glassful of water), three times a day, after meals, will be almost sure to remove it.

MEGRIMS—VERTIGO are the terms usually applied when a horse at work reels, and then either stands for a minute dull and stupid, or falls to the ground, lying for a time partially insensible. These attacks come on suddenly, are often periodical, are most frequent during hot weather, and when the animal is drawing up a hill, or exposed during heavy work to the full rays of a hot sun. Liability to megrims constitutes unsoundness, and usually depends upon the circulation through the brain being temporarily disturbed by the presence of tumors. Horses subject to megrims are always dangerous; if driven at all, they should be used with a breastplate or pipe-collar, so as to prevent, as much as possible, pressure on the veins carrying the blood from the head: they should be moderately and carefully fed, and during hot weather have an occasional laxative.

MAHÁDIA, the ancient Thurmæ Hercules, a t. of Hungary, 6 m. w. of Roumania, 15 m. n. of Orsova; pop. 1800. Since the time of the Romans it has been noted for its baths. The sulphurous springs are beneficial in gout and other diseases. They are annually frequented by many visitors.

MEHEMED or MEHEMET ALI, also MOHAMMED ALI, Viceroy of Egypt, was b. in 1769 at Kavala, a little town in Macedonia, entered the Turkish army at an early age, and, in 1799, was sent to Egypt at the head of a contingent of 300 troops to co-operate with the British against the French invaders. Here his fine military qualities rapidly developed themselves, and he at length became commander of the Albanian *corps d'armée* in Egypt. In 1806 he was recognized by the porte as viceroy of Egypt, and pasha of Three Tails; but was soon involved in disputes with the Mamelukes, who had long practically ruled Egypt. The struggle was finally terminated in 1811, by the mas-

sacre of the greater number of these at Cairo. The rest fled to Upper Egypt, but were expelled by Mehemed in the following year. They then took refuge in Nubia from their remorseless foe, but in 1820 he followed them thither, and they were utterly exterminated.

The Porte now felt alarm at his growing power, and with a view to break it, intrusted him with the command of an expedition against the Wahabis, a religious sect of Arabia. But the victories of his son, Ibrahim Pasha (q.v.), only rendered him more powerful, and his authority extended itself over a great part of the Arabian peninsula. Shortly after, he conquered Kordofan, added it to his dominions, and opened up a great trade in black slaves from the interior of Africa. About this time he began to reorganize his army on something like European principles, built a fleet, and erected fortresses, military workshops, and arsenals. His ambition, however, received a severe check by the total destruction of his new navy at Navarino, in 1827. In 1830 the Porte conferred on him the government of Candia, but this did not satisfy him; and in the following year, on a frivolous pretext, he sent out an army for the conquest of Syria, under Ibrahim Pasha, who, by his victory at Konieh (Dec. 20, 1832), brought the Turkish government to the brink of ruin. The European powers now stepped in, and a treaty was concluded (May 4, 1833), by which Syria was ceded to Mehemed, on condition of his acknowledging himself a vassal of the sultan. Neither of the belligerents was satisfied, and Mehemed continued to plot in his usual secret and crafty style, till sultan Mahmud was obliged in 1839 to declare war against his dangerous subject. The European powers again interfered, and Mehemed saw himself compelled to give up all his claims to the possession of Syria, and to content himself with getting the pashalic of Egypt made hereditary in his family. If the infirmities of age had not now begun to tell upon Mehemed, he might have become what many in fact have pronounced him to be—the regenerator of Egypt! He thoroughly cleared the country of robbers from Abyssinia to the mouths of the Nile; he may almost be said to have introduced the cultivation of cotton, indigo, and sugar into the country. While Syria was under his rule, he increased to an immense extent the mulberry plantations, and consequently the cultivation of silk; and to crown all his efforts, he established in Egypt a system of national education! In his last years, he fell into a sort of religious dotage, and at last, in 1848, resigned his viceroyship in favor of his son, Ibrahim Pasha (q.v.). Mehemed died Aug. 2, 1849.

MEHUL, Étienne Henri, 1763–1817; b. at Givet, France. At the age of 10 he was organist of his native village and was soon after destined for the church. The advent of a regiment and martial music fired his worldliness, and he found means to reach Paris. There, after fighting the unexpected misery of cold and hunger, at the age of 17 he attracted the sympathy of Glück, the composer. After several unsuccessful efforts his *Euphrosine et Coradin* achieved fame in 1790, and other compositions previously written were then brought to light. *Stratonice* appeared in 1792; and this was followed by patriotic national hymns for the army of the republic, entitled *Le Chant du Depart; Le Chant de Victoire; Le Chant du Rétour*, which won him high popularity. Other works appeared in rapid succession: in 1803 *Uthal;* afterwards *Une Folie, ou les Aveugle de Tolède;* and in 1817 *Joseph*, his most esteemed composition. Died in Paris.

MEIAPON'TÉ, a t. of Brazil, in the province of Goyaz, about 80 m. e.n.e. of the town of Goyaz, on the river Almas. In the neighborhood are some gold mines; and the district produces millet, barley, cotton, tobacco, and sugar. Pop. 8,000.

MEIGGS, Henry, 1811–77; b. N.Y.; was in New York, engaged in the lumber business, in 1835, and failed in the commercial crisis of 1837. He, however, made another effort in the same business in Williamsburg, L. I., was for a time successful, and was elected president of the board of trustees of the town; but in 1842 he again failed, and it was not until the outbreak of the gold excitement in California that he again became seemingly prosperous. He shipped lumber in large quantities to the Pacific coast; and his trade so increased that he was encouraged to build a large number of vessels, until, at length, a financial stringency in the San Francisco money market drove him to borrowing, and eventually his business collapsed, and he fled to South America. He settled in Chili, and entered into the business of a contractor for building bridges, and, by one of his contracts with the government of Chili, made a profit of $1,300,000. He afterwards devoted himself to railroad construction, and in Peru accomplished engineering works which are objects of general admiration. He made contracts for the construction of six railroads in that country, one of which, the Callao, Lima and Oroya railroad, ranks among the first public works of the kind in the world. It is recorded to the honor of Mr. Meiggs that, having by his industry and enterprise succeeded in greatly improving his impaired fortune, he returned to San Francisco and arranged to discharge all the obligations which were in existence there against him. He was a man of refined tastes; greatly interested in art, in which he was a connoisseur; and at the time of his residence in New York city was president of a prominent musical association.

MEIGS, a co. in s.e. Ohio; drained by branches of the Ohio river, which separates it on the s. and s.e. from West Virginia; 490 sq.m.; pop. '80, 32,235—2,273 of foreign birth. The surface is uneven and in large part covered by forests of valuable timber; wheat, hay, corn, and oats are staples. Bituminous coal, salt, and limestone are found; in 1870 over 200,000 tons of coal were mined. Chief town, Pomeroy.

MEIGS, a co. in e. Tennessee; drained by creeks emptying into the Tennessee and Hiawassee rivers, which bound it on the n.w. and s.; the East Tennessee, Virginia and Georgia railroad runs near the s.e. boundary; 225 sq.m.; pop. '80, 7,117—810 colored. The Blue Ridge mountains cover much of the surface, and the hill-slopes and bottom-land is well fitted for raising corn. The climate is very invigorating. County seat, Decatur.

MEIGS, BENJAMIN C., 1789–1862; b. Conn.; graduated at Yale college in 1809; at Andover theological seminary in 1812; was ordained in 1815; sailed as a missionary of the American board; reached Ceylon in 1816. He was stationed for many years at Tillipally. Returning for the second time to America in 1858, on account of ill health, he died in New York. He was a man of kind, conciliatory spirit, sagacious in judgment, and greatly esteemed by the natives as well as by his missionary associates.

MEIGS, CHARLES DELUCENA, 1792–1869; b. at St. Georges in the Bermuda islands; educated as a physician, taking degrees from both the university of Pennsylvania and the college at Princeton (1818). In 1820 he began practice in Philadelphia and was chosen a professor in the Jefferson medical college in 1840, a position which he held for 22 years. He was specially skillful in obstetrics and the diseases of women and children, to which he devoted most of his time. He published several treatises on these and kindred subjects, and also, in 1852, a memoir of Samuel G. Morton, M.D.

MEIGS, JAMES AITKEN, b. Philadelphia, 1829; received a medical degree from the Jefferson medical college, and in 1857 was appointed to the professorship of the institutes of medicine in the medical college at Philadelphia. In 1859 he was called to a similar position in the Pennsylvania medical college, whence he removed in 1868 to become a professor in the Jefferson medical school. Besides a number of scientific papers, he has published an edition of Kirke's *Manual of Physiology*.

MEIGS, MONTGOMERY CUNNINGHAM, b. Ga. 1816; received his education at the university of Pennsylvania and the U. S. military academy, graduating at West Point, July, 1836, and receiving the appointment of second lieut. in the artillery. In the following year he was exchanged into the corps of engineers, in which corps he became first lieut. in 1838 and capt. in 1853. During the period between his graduating and the year 1852 he was employed in various important engineering undertakings on the part of the war department, including the building of fort Delaware and the Delaware breakwater, improvements of the Delaware bay and river, the construction of fort Wayne, Mich., and forts Porter and Niagara, N. Y., and fort Montgomery, N. Y. In 1852 and for 8 years thereafter he was employed in superintending the Washington and Georgetown water-works, a magnificent engineering enterprise, by means of which those cities were supplied with water from the Potomac river by means of the Washington aqueduct. During this period he also superintended the erection of the capitol extension in Washington and the post-office extension, as well as the great iron dome of the capitol. In the early part of the winter of 1860 he was dispatched to forts Jefferson and Taylor, in Florida, with orders to place them in a position for defense, and in the following spring was made chief engineer of the fort Pickens relief expedition. On May 14, 1861, he was appointed col. 11th infantry; and May 15 quartermaster-gen. of the U. S. army, with the rank of brig.gen. In this important position gen. Meigs had the direction of the supply and equipment of the United States forces in the field during the continuance of the war. He was frequently obliged to make personal inspection of the quartermaster's department of the various armies during siege and field operations, this being particularly the case at Chattanooga in 1863 and during the battles of the Wilderness in 1864. On July 5, 1864, he was brevetted maj.gen. In Jan., 1865, he superintended the refitting of the army of gen. Sherman after its return from the march to the sea. In 1867 and '68 he made an inspection of the departments of the west and the Pacific coast; and in 1875 was sent to Europe on a special mission of examination of the staff department of the European armies.

MEIGS, RETURN JONATHAN, 1740–1823; b. at Middletown, Conn.; he was engaged in the attempt on Quebec under Arnold, holding the rank of maj., and was there taken prisoner. After his exchange in 1776 he became col. of a regiment raised in the following year by his own exertions, and served with great credit in the actions of Sag Harbor and Stony Point. He was naturally of an enterprising and restless spirit and was one of the first emigrants to that part of Ohio known as the Connecticut Reserve; settling at Marietta in 1788. He was commissary-gen. under Wayne in the Indian campaigns, and in 1801 was made an Indian agent by the government. It was while employed in this capacity at the Cherokee agency in Georgia that his death took place. In 1776 col. Meigs published in the *American Remembrancer* an account of the Quebec expedition, which has been reprinted (N. Y., 1864).

MEIGS, RETURN JONATHAN, Jr., 1765–1825; b. Middletown, Conn.; graduated at Yale in 1785; went with his father to Marietta, O., in 1788, and entered upon the profession of the law. He was chief-justice of the supreme court of Ohio in 1803–4; brevet col. of the U. S. army, serving in Louisiana 1804–6; a judge in Louisiana 1805–6; and U. S. district judge in Michigan 1807–8. He was U. S. senator from Ohio 1808–10; governor of that state 1810–14, and U. S. postmaster-general 1814–23. Died at Marietta.

MEINERS, CHRISTOPH, 1747–1810; b. Ottendorf, Hanover. Little is known of his early life. He was educated at the university of Göttingen, where he was appointed professor of philosophy, and afterwards rector. Of his numerous historical works the following are the most important: *Revision der Philosophie; Versuch einer Religions geschichte der ältesten Völker besonders Ægyptens; Historia Doctrinæ de Vero Deo; Geschichte des Verfalls der Sitten und Staatsverfassung der Römer.* Besides his own works, he edited in connection with J. G. Feder *Philosophische Bibliothek*, 4 vols.; and with Spittler *Göttingisches Historisches Magazin; Neueres Magazin*, 3 vols. Most of his works were designed to show the difference between past and present morals.

MEIN'INGEN, the capital of the duchy of Saxe-Meiningen-Hildburghausen, lies in a narrow valley, on the banks of the Werra. Pop. '75, 9,521. The ducal castle, built in 1681, contains a fine library and several art collections. The "English garden" attached to it is one of the finest in Germany. Meiningen has almost no trade.

MEIS'SEN, one of the oldest towns in the kingdom of Saxony, is situated on the left bank of the Elbe, 15 m. below Dresden. Its chief building is the cathedral, the finest Gothic church in Saxony, surmounted by an exquisite spire of open-work, and containing many monuments of very early times. There are here a number of brasses, some of them finer than any in England or Flanders. Meissen was founded in 928 by Henry I. of Germany, as a bulwark of his German territories against the Slavonians, and was long the capital of the markgrafdom of Meissen, which was subsequently merged in the duchy of Saxony. Otto I. founded the cathedral. It was, however, burned down at the beginning of the 13th c.; rebuilt 1266–93; since which time it has been twice destroyed by fire, and restored. The castle, built on a precipitous rock overlooking the town, and formerly the residence of the markgrafs, burggrafs, and bishops of Meissen, was rebuilt in 1471; and in 1710 was converted into a porcelain factory, but has recently been restored to more dignified uses. The famous porcelain factory, now provided with more suitable premises, employs about 400 hands. Other manufactures are iron, machinery, pottery, and ivory-carving. Pop. '75, 1302.

MEISSNER, AUGUSTUS GOTTLIEB, 1753–1807, b. Silesia; educated at Wittemberg and Leipsic, where he studied law. He was for a time a chancery clerk, and curator of the Dresden archives. In 1785 he was appointed to the chair of classical literature and æsthetics in the university of Prague; and for the last two years of his life he was director of the Fulda high school. He translated a number of dramatic pieces from Molière, and Destouches, and was himself the author of three fairly successful operas, *The Mufti's Grave; The Alchemist;* and *The Beautiful Arsene.* But his most popular work is his *Sketches*, 14 series of which were published between 1778 and 1796. They are a collection of miscellaneous stories, dialogues, anecdotes, and essays. These pieces were extensively translated and imitated in other languages, and a few of them were included by Thompson in his *German Miscellany.* Of a similar plan and character are the *Tales and Dialogues*, which appeared from 1781–89. Besides these smaller works Meissner wrote a number of romances, and historical novels of considerable length, such as *Alcibiades; Masaniello; Bianca Capello;* and *Spartacus.*

MEISSONIER, JEAN LOUIS ERNEST, b. Lyons, in 1811, of a poor family. At the age of 19, after a youth of little opportunity for improvement, and many hardships, he found his way to Paris to study painting, which he had already practiced in Lyons on works for which he and Daubigny received 5 francs a square yard—paintings made for exportation. He was soon admitted to the studio of Leon Cogniet, where his disposition to make small paintings of exquisite precision, and his neatness of touch in giving high relief to small figures, soon made him the leader of a distinct school. His first public exhibitions were in 1836, the "Chesspiayers," and the "Little Messenger." From that time he has had a continually increasing reputation, and his industry and care in the exquisite finish of his almost microscopic details has been maintained without sacrifice of the general effects. Théophile Gautier says of him: "He is original. What he has wished to do, he has done completely, in design, color, fineness of touch, and result." The smallest inanimate objects acquire a peculiar life and meaning under his touch, and when he has finished a painting it seems beyond the suggestion of improvement. Meissonier has won all the honors of his art in the salons and exhibitions of Paris, and is rich with the proceeds of his labor. His works are too numerous to name. One of his best, "A Charge of Cavalry," is in the possession of Mr. Probasco of Cincinnati, for which he paid $30,000. Meissonier has also succeeded in portraits, though not so remarkably as in his characteristic work.

MEJERDA RIVER, in n.e. Africa, flowing through Algeria and Tunis. It rises in the Great Atlas range and is formed by the juncture of several small streams; its course is n. and n.e., and it empties into the gulf of Tunis, about 24 m. n. of the city of Tunis. The extent of the whole course is about 200 miles. In ancient times it was known as the Bagradas, and Carthage was not far from its banks; but its course has since been greatly changed, and it now flows near the ruins of Utica.

MEJI'A, IGNACIO, b. Mexico, 1814; received his education at the institute of arts and sciences of Oaxaca. In 1829 he volunteered for the defense of his country against a Spanish invasion, and in 1833 was made capt. of grenadiers, and col. in 1846. He was

military commander and provisional governor of the state of Tehuantepec in 1852, and during the "war of reform" was prominent on the side of the liberals. In 1858 he was in command of a brigade, and fought the battles of Teotitlan and Pachuca; being defeated in the first of these, Oct. 20, 1861. He acted as quartermaster of the army which resisted the invasion of the French in 1861, and was engaged in the defense of Puebla in 1862, being taken prisoner when that stronghold capitulated in May, 1863. He was sent to France, and not released until the summer of 1864, when he returned to Mexico, and in 1865 was appointed a gen. of division, and made minister of war.

MEJIA, THOMAS, 1812–67, b. Mexico; a native Indian, who exercised great power over the Indian tribes in Mexico, and took a prominent part in Mexican affairs. He served with distinction through the war with this country in 1846–48. He quelled an insurrection in 1849, but six years later put himself at the head of one for the purpose of overthrowing gen. Comonfort. This movement was unsuccessful, as was a coalition which he organized the next year between the clericals and conservatives. In 1857, after several defeats, he was forced to surrender. In 1858 he drove the Juarez government out of Queretaro, and held out successfully against Juarez, till the triumph of the latter in 1860, when he resorted to guerilla warfare. He was a trusted adherent of Maximilian, but was finally captured and put to death.

MEK'HITAR, or MECHITAR. See MECHITARISTS, *ante*.

MEK'LONG, a t. of Siam, at the confluence of the Meklong river with the w. mouth of the Menam, 30 m. s.w. of Bankok. Pop. estimated at 10,000. The province furnishes salt for all the kingdom.

MEKONG, MEIKHONG, MAKIANG, or CAMBODIA, RIVER. See COCHIN CHINA, *ante*.

MEKRAN, or MUKRAN, a province of Beloochistan in Asia, lying between 25° and 28° n. lat., and 58° and 68° e. long. It is bounded on the s. by the Indian ocean, w. by Persia, and n. by Afghanistan and Sarawan, being about 500 m. in length and 200 m. broad. It comprises by far the greater part of Beloochistan, about 100,000 sq.m., and is divided into many petty districts, each having its separate chief. The n. part is very rugged, and is traversed from e. to w. by two ranges of mountains, while the lower or s. part is level, barren, and desolate. The inhabitants, of whom there are 200,000 or more, are not advanced in civilization. They practice polygamy and hold slaves. There is very little trade or manufacturing carried on. The vegetation is scanty, the most prolific natural production being the date-palm. Fishing is carried on to a very considerable extent, and is the main support of a large part of the people. The country is, as to government and law, in a wretched condition. The route used by Alexander the great on his return from Egypt is still to be seen, and with one exception is the only practicable road for an army between India and Persia.

MELA, POMPONIUS, a Latin writer—the first who composed a strictly geographical work—was a native of Spain, and is believed to have lived in the time of the emperor Claudius, but nothing whatever is known concerning him. Mela's compend is in three books, and is entitled *De Situ Orbis*. The text is greatly corrupted, on account of the abundance of proper names; but the style is good, and the author shows a very creditable diligence of research and discrimination in the use of his authorities. The *editio princeps* appeared at Milan in 1471; there are editions by Tschucke (1807), Weichert (1816), Parthey (1867). Mela was translated into English as long ago as 1585.

MELALEU'CA. See CAJEPUT.

MELAMPUS, in mythology, the son of Amythæon; his mother is said by different authors to be Aglaia, Rhodope, or Eidomene. He is represented as a physician and prophet, and is said to have acquired his powers of divination in this way: While he was sleeping, one day, before the house of his uncle, king Neleus of Pylos, some serpents which he had tamed licked his ears and wakened him, whereupon he understood the language of the birds, and could read the future. Apollo imparted to him all the secrets of the art of medicine. For his services in curing the Argolian women of madness, Anaxagoras gave him a third of the kingdom of Argos, and another third to his brother Bias. According to other mythologists, Melampus restored to sanity the three daughters of king Proetus of Argos, and was rewarded by their father with the hand of Iphianassa, the eldest, and with a third of the Argive kingdom; by her he had four children, Antiphates, Manto, Bias, and Pronoe. He was accounted by the Greeks the first physician and prophet; and his posterity were also endowed with prophetic gifts. He was worshiped as a god after his death, and a temple was erected in his honor at Ægosthena, in Megaris.

MELANCHO'LIA, as a disease, is the exaggeration of the natural and legitimate feelings of grief, despondency, and apprehension, which become morbid where the emotion is without a cause, disproportioned to the actual cause, or so intense as to disturb and destroy the exercise of the other mental powers. This dejection and suffering is found associated with exalted sensations, or delusions as to the personal or physical condition of the individual, which originate in habitually cherishing certain impressions, in fixing the attention upon certain vital processes, which may be unhealthy, or become so by the very concentration of thought bestowed upon them. The patient lives in fear of death,

in the conviction that he is differently or more exquisitely constructed than those around; that he labors under some foul or fatal disease; that he is destitute of strength or comeliness. This has been regarded as hypochondriacal melancholia—the *maladie anglaise*, and affects the opening of life. Similar feelings are called forth in reference to the social position. There arises a dread of poverty and want. The victim is haunted by imaginary debts, obligations, peculations. He feels incapable of extricating himself. The poor, as well as the rich, entertain such doubt and dread. They starve, in order to husband their resources. This affection prevails at maturity—at the period of greatest activity and usefulness. Toward the decline of life—although encountered at every age—morbid depression assumes the form of religious anxiety, despair, remorse. Moral statistics show that among the inhabitants of northern Europe the number of cases of melancholia exceeds those of mania; and it has been supposed that the rudiments of the malady may be detected in the original character, the temperament, and the habits of the race, as well as in the climate, domestic condition, and diet, by which these are modified. Defective blood nutrition, or anæmia, appears to be the physical state with which the great majority of cases of melancholia are connected, and to which all modes of treatment are directed. Powerful and permanent and depressing moral emotions act as effectively in arresting healthy digestion and alimentation, as the use of injudicious food, or the use of proper nourishment under circumstances such as the respiration of impure air, or indulgence in intemperate or degraded tendencies, which render assimilation impossible. The aspect of the melancholiac corroborates the view of inanition and exhaustion. The surface is pale, dry, cold, attenuated, even insensible; the muscles are rigid; the frame is bent; the eyes sunk, and fixed or flickering; the lips parched and colorless. There is a sense of exhaustion or pain, or impending dissolution. It has been remarked, that in proportion to the intensity of the internal agony is there an obtuseness or anæsthesia to wounds or external injuries. Such an immunity gives in lunatics an indifference to the most grievous forms of suffering, and may explain the conduct of many reputed martyrs and even criminals under punishment.—Haslam, *Observations on Madness and Melancholy;* Esquirol, *Maladies Mentales*, t.i. p. 398; Crichton, *Inquiry into Nature and Origin of Mental Derangement.*

MELANCHTHON, PHILIP, Luther's fellow-laborer in the reformation, was b. Feb. 16, 1497, at Bretten, in the palatinate of the Rhine, now in the grand duchy of Baden. His name was originally Schwarzerd (black earth), of which Melanchthon is a Greek translation. He was educated at the university of Heidelberg, where he took the degree of bachelor of philosophy in 1512. In the same year he went to Tübingen, studied theology, took the degree of master, and in 1514, gave lectures on the Aristotelian philosophy and the classics. About this time, he published a Greek grammar. On his relative Reuchlin's recommendation, he was appointed, in 1518, professor of the Greek language and literature in Wittenberg. He soon decided in favor of the reformation, and brought to the aid of Luther great attainments in learning, great acuteness in dialectics and exegesis, a remarkable power both of clear thinking and of clearly expressing his thoughts; and, along with all, a gentleness and moderation that most advantageously tempered Luther's vehemence. In 1521 he published his *Loci Communes Rerum Theologicarum*, the first great Protestant work on dogmatic theology. It passed through more than fifty editions in the course of the author's life. In 1530, he made a most important contribution to the cause of Protestantism in the Augsburg confession (q.v.). In 1541 he went to Worms, and soon after to Ratisbon, to conduct the cause of the Protestants in the conferences there. But the influence of the papal legate counteracted all his efforts for a peaceful accommodation, and his own party were much dissatisfied on account of the concessions which he made. After Luther's death Melanchthon lost in some measure the confidence of some of the Protestants, by those concessions to the Roman Catholics which his anxiety for peace led him to make; whilst the zealous Lutherans were no less displeased because of his approximation to the doctrine of Calvin on the Lord's supper. His consent, conditionally given, to the introduction of the Augsburg interim (q.v.) in Saxony, in 1549, led to painful controversies; and he was involved in various controversies, which filled the latter years of his life with disquietude. He died at Wittenberg, April 19, 1560. Melanchthon, although gentle, was emotional and excitable, and conciliatory in the extreme. As a public teacher, he was exceedingly admired, and students flocked to him from all parts of Europe. He was essentially a theologian and scholar, and in his habits, if not in his opinions, was the precursor of those acute and laborious divines who have in modern times shed so much luster on the German church. The most complete edition of his works (which comprise a Greek and Latin grammar, editions of and commentaries on several classics and the Septuagint, biblical commentaries, doctrinal and ethical works, official documents, declarations, dissertations, responses, and a very extensive correspondence with friends and the leading men of the age) is that by Bretschneider in his *Corpus Reformatorum* (28 vols. 1834–60). Melanchthon's life has been written by his friend Camerarius (1566), and frequently in the course of the present century. One of the latest is by Schmidt (1861). The tricentenary of Melanchthon's death (April 19, 1860) was celebrated with great solemnity throughout Germany.

MELANESIA. See MICRONESIA AND MELANESIA.

MELANORRHŒ'A, a genus of trees of the natural order *anacardiaceæ*. To this genus belongs the BLACK VARNISH TREE (*M. usitata*) of Burmah and the n.e. of India, called *Theet-tsee* or *Zitsi* in Burmah, and *Khew* in Munipoor. It is a very large tree, attaining a height of 100 ft, with large, leathery, simple, entire, deciduous leaves, and axillary panicles of flowers. It yields a viscid, rust-colored juice, which becomes black on exposure to the atmosphere, and is excessively acrid, causing swellings with much pain and fever if it touches the skin. It is, however, much valued as a varnish for painting boats, and vessels intended to contain liquids, and also as a size-glue in gilding. This black varnish is a considerable article of trade in India and Burmah.

MELANO'SIS. See TUMORS, *ante*.

MELANTHA'CEÆ, a natural order of endogenous plants; containing bulbous, tuberous, and fibrous-rooted plants, with or without stems, and having parallel-veined leaves which are sheathing at the base. The fruit is a capsule, generally divisible into three pieces.—There are about 130 known species, natives of all parts of the world, but most abundant in northern countries. Some resemble crocuses, and some are like small lilies. The order is characterized by a great prevalence of poisonous qualities. Some of the species are employed in medicine, particularly colchicum (q.v.), white hellebore (*veratrum album*, see HELLEBORE), and Sabadilla (q.v.). The root of *helonias dioica* is used in North America as an anthelmintic and tonic bitter. The plant grows in wet places, and is called *starwort* and *blazing star*, also *unicorn's horn* and *devil's bit*.

MELA-ROSA, the fruit of the genus *citrus*, and probably a variety of the lime (q.v.), cultivated in Italy. It receives its name from its fragrance being thought to resemble that of the rose. It is a small flattened fruit, with a protuberance at the tip, from which many raised ribs proceed in a star-like form to the circumference. The skin is yellow, thin, and adheres closely to the pulp.

MELASTOMA'CEÆ, a natural order of exogenous plants, containing about 1200 known species; trees, shrubs, and herbaceous plants, mostly natives of warm climates, although a few are found in the temperate parts of North America. They have opposite undivided leaves, destitute of dots. The flowers are regular.—None of the melastomaceæ possess poisonous properties; some are used in dyeing; the gratefully acid leaves of some are cooked and eaten—particularly those of species of *medinilla* and *astronia papetaria* in the Malay Archipelago; some yield eatable and pleasant fruits, as *blakea triplinervis* in Guiana, *clidemia hirta* in the West Indies, and *memecylon edule* in Coromandel. The wood of some is tough and hard.

MELAZZO. See MILAZZO, *ante*.

MEL'BOURNE, capital of the British colony of Victoria, in Australia, is situated chiefly on the n. bank of the Yarra-Yarra, about 9 m. by water and 2 m. by land above its mouth, in the spacious bay of Port-Phillip. Lat. 37° 48′ s., long. 144° 58′ east. Its streets are straight, regular, and wide, and are paved, macadamized, and plentifully supplied with gas and fresh water. Collins street, one of the leading thoroughfares, is one-third wider than the famous Broadway of New York. Melbourne is built of brick and stone, and contains many fine churches. Perhaps nothing gives stronger testimony to the wealth and enterprise of the inhabitants of Melbourne, than the rapidity with which so many noble institutions as adorn the city have sprung up among them. Among these, one of the chief is the university, with an annual endowment from the state of £9,000, and possessing valuable scholarships and exhibitions. It is a large building, in the shape of a parallelogram, and is surrounded by extensive grounds. It was opened in April, 1855, and has a respectable staff of professors, with a considerable attendance of students in arts, law, engineering, etc. The post-office, a magnificent structure, in the Italian style, elaborately ornamented with sculpture, was built in 1859. The Yan-Yean water-works, by means of which water is conveyed by iron pipes from a distance of 18 m., were opened in 1857. The parliament houses were erected in 1855, at a cost of £400,000. The buildings for the exhibition of 1880 cost above £70,000. Besides those mentioned, the chief institutions are the Melbourne hospital, the benevolent asylum, the immigrants' home, the servants' home, the orphan asylums, the lying-in-hospital, treasury, county and city courts, public library, custom-house, barracks, picture gallery, the numerous richly ornamented banks, the grammar-school, Scotch college, besides many other educational establishments, and numerous literary and scientific institutions and societies. There are three daily newspapers, one evening journal, and several weeklies and monthlies. Melbourne is the center of about a dozen converging lines of railway; several of these being, however, only suburban lines. There are several theaters and public parks. The temperature is moderate; the mean of the year being 59°, and the variation between the average temperature of January (midsummer) and July (winter), 19°. The annual rainfall is about 32.33 inches. Melbourne occupies the first rank among the ports of the British colonies, and is the most important trading town of the southern hemisphere. The pop., including the suburbs, is, '77, 244,700. The chief exports are gold, silver, wool, hides, cattle, and sheep. Six-sevenths of the entire commerce of the colony is carried on by Melbourne. For further information regarding trade, etc., see VICTORIA. Vessels drawing 24 ft. can come up to the mouth of the Yarra-Yarra, but are unable to ascend the river, on account of two bars which obstruct

its course. Melbourne, however, is connected with Sandridge on Port-Phillip by means of a railway 2 m. long. The chief industrial establishments of Melbourne are flour-mills, tallow-boiling works, and brass and iron foundries. It is the see of an Episcopal bishop and a Roman Catholic archbishop.

PORT-PHILLIP, on which Melbourne is situated, is a spacious and beautiful inlet of the South Pacific ocean, on the s. coast of Australia, and is 35 m. long, by about 25 m. broad. Its entrance, which is only 2 m. in width, is formed by two projecting promontories, called the Heads; and on these promontories strong fortifications were erected in 1861. Navigation at the entrance of the port is difficult, on account of the foul ground on either side, and the violence of the ebb and flood tides, which is caused by the unevenness of the bottom.

Melbourne was first colonized in 1835, and received its name from lord Melbourne, then the British prime minister, in 1837. It became the seat of a bishop in 1847, and in 1851 the capital of the newly-formed colony of Victoria. The discovery of gold in Victoria in 1851, which gave such a surprising impetus to the material prosperity of Melbourne, is treated of under VICTORIA.

MELBOURNE, WILLIAM LAMB, Viscount, English minister, was second son of sir Peniston Lamb, of Brocket hall, Herts, who was raised to the peerage. Melbourne was born in London in 1779. His university education he received first at Trinity college, Cambridge, and next at Glasgow, where he studied jurisprudence and politics under prof. Millar. He entered the house of commons for Leominster in 1805, and joined the whig opposition, under the leadership of Charles James Fox. He accepted the chief secretaryship of Ireland in Mr. Canning's government, and this partial alienation from the whigs was increased when he not only took office under lord Goderich, but remained for a short time in the government of the duke of Wellington. In 1828 the death of his father transferred him to the upper house. In 1830 he accepted the seals of the home office in the government of earl Grey, but his administration was by no means popular or successful. In July, 1834, earl Grey retired, and William IV. sent for Melbourne. In November, the king chose to consider the removal of lord Althorp to the upper house as the breaking up of the Melbourne ministry, and sent for sir Robert Peel, to form a conservative administration. But the house of commons resented the interference of the crown, and a new parliament having shattered the new government, Melbourne again became first lord of the treasury. On the accession of queen Victoria in 1837, it became the duty of Melbourne to instruct the young sovereign in the various duties of her high station, and fit her to perform her part as the constitutional monarch of a free country. In 1841 his government was succeeded by that of sir Robert Peel. Henceforward, Melbourne took little part in public affairs. He had little of the oratorical faculty, and was ineffective as a speaker, but possessed a cheerful temper and cordial frankness of manner, which made him many friends. He possessed classical tastes and rare social qualities, joined with an easy temper and careless habits. Sydney Smith, in his second letter to archdeacon Singleton, has described his character with an exquisite mixture of sarcasm and compliment. He married (1805) a daughter of the earl of Bessborough, who, under the title of LADY CAROLINE LAMB (b. 1785, d. 1828), attained some celebrity as a novel-writer and a correspondent of lord Byron. Melbourne died Nov. 24, 1848.

MELCHITES, the name given to Christians in Syria and other parts of the east, who, acknowledging the authority of the pope, and the doctrines of the church of Rome, adhere to the liturgy and ceremonies of the Eastern church. They conduct divine service in the vernacular tongue, and receive the Lord's Supper in both kinds. Their priests may be married before ordination, but not their bishops. They are chiefly to be found in Aleppo and Damascus. Their patriarch resides at Damascus. The name Melchites (lit. Royalists) dates from the 5th c., when they were supported by the emperors against the Monophysites (q.v.).

MELCHIZEDEK, or MELCHISEDEC, said in Genesis to have been "king of Salem and priest of the most high God," met Abraham—on his return from the successful pursuit of Chedorlaomer and his allies which he had undertaken for the rescue of Lot—refreshing him with bread and wine and pronouncing a remarkable blessing on him; after which Abraham gave him tithes of all the spoils, thus acknowledging his official superiority. In Ps. cx. David, in predicting the Messiah, says that by divine decree he was to be "a perpetual priest after the order of Melchisedec." This prediction the epistle to the Hebrews interprets in its application to the Lord Jesus Christ and as connected with the historical narrative, to all of which it ascribes a symbolic character, both in the particulars which it relates and in the silence which as to other things it maintains. As named Melchisedec he represented the king of righteousness, and as being king of Salem the king of peace. As in the narrative he stands alone with no mention of his father, mother, descent, birth, or death, he becomes a striking emblem of the uncreated Son of God and of a perpetual priest. As blessing Abraham and receiving tithes from him his superiority to Abraham and therefore to Levi the priestly son of Abraham was proved. Consequently the priesthood of Christ, which was according to the order of Melchisedec, was designed to supersede the priesthood of Levi and was superior to it, as Levi and his descendants were all under the power of death and would in succession pass away. These three passages of Scripture (in Genesis, the Psalms, and Hebrews,) contain all that

is said about him and all that is known. But in all the past centuries mystery has enveloped his name, and various conjectures concerning him have been made. The Jews perceiving his superiority to Abraham as indicated by the blessing bestowed and the tithes paid, explained it by supposing that the kingly priest was Shem, who as a survivor of antediluvian times had a right to be reverenced as the head of the human race. Jerome testifies that this was the opinion of the Jews in his day, and it was adopted in modern times by Luther, Melanchthon, Selden, Lightfoot, and others. Another old notion which Jerome says Origen cherished was that the royal priest was an angel. A small sect in the 4th c. called after his name taught that he was a power or influence of God greater than Christ. A few others regarded him as the Holy Ghost. Epiphanius says that some in his day believed that he was the Son of God in human form; to this opinion Ambrose seemed inclined and it has been held by many in modern times. Some among the Jews also regarded him as the Messiah. All these conjectures, however, are not only without support, but are with difficulty reconcilable with the Scriptures.

MELCHTHAL, ARNOLD VON, b. Switzerland, late in the 13th century. He was called Melchthal from the village of his birth in the canton of Unterwalden, but his name was Winckelried. Melchthal killed the servant of an Austrian bailiff, who had come to Melchthal to seize the oxen of Melchthal's father, a well-to-do proprietor in Unterwalden. In revenge, the Austrians put out his father's eyes, a tragic incident which is employed by Schiller in his *Wilhelm Tell*. When Melchthal heard of his father's blindness, he met his friends Fürst of the canton of Uri, and Stauffacher of the canton of Schwyz, on the banks of lake Lucerne, and all three took oath to do all in their power to liberate the three cantons from Austrian rule. This was in November, 1307; and the next year the mountaineers of the three cantons successfully opposed the Austrians. Arnold of Melchthal is said to have attempted, at the battle of Sempach, to break a line of Austrian spears, and to have died "gathering into his bosom the sheaf of foreign spears." The whole story of the three patriots of the three cantons, seems to be as much of a myth as the legend of William Tell with which it is connected. It is found in the *Chronicon Helveticum* of Ægidius Tschudi.

MELCOMBE, LORD. See DODINGTON, *ante*.

MEL'COMBE RE'GIS AND WEYMOUTH. See WEYMOUTH.

MELE'AGER, a legendary Greek hero, whose name is connected with the Argonautic expedition, and more conspicuously with the hunting of the Calydonian boar. He was the son of Oeneus, king of Ætolia, and Althæa, daughter of Thestius. Upon the seventh day after his birth the three Fates came to the palace of Oeneus, and pointing to a brand burning on the hearth, said that the child should not die till that brand should be spent. Althæa thereupon put water on the brand, and laid it away in a safe place. As Meleager grew to manhood he made a great name in war and in the chase. He went with the other heroes in quest of the golden fleece; and when Artemis, in her wrath, sent a monstrous wild boar to harry Calydon, Meleager was at the head of the hunters. Of this Calydonian hunt two stories are told. One says that Artemis had sent a wild boar into Calydon because Oeneus had not done sacrifice to her at the feast of harvest-home, and that Meleager, with many huntsmen and dogs, gave chase to the boar, which was soon slain. The Curetes and Ætolians wrangled over the boar's hide and head; and war breaking out between them, the Curetes had ever the worst, till Meleager, angered at Althæa, his mother, left the field and shut himself up in his house with Cleopatra, his wife; nor would he be moved by the prayers of his father and mother to go out against the Curetes till they had scaled the towers of Calydon; when his wife succeeded in persuading him to fight against the enemy, whom he repelled. The other and more modern legend represents all the Greek heroes as taking part in the hunt at the invitation of Meleager. Among them were Castor and Pollux, Theseus, Peleus, Jason, and Pirithous. Atalanta, daughter of Jasus, had come from Arcadia to join the hunt, but some of the heroes objected to a woman taking part in it. Their objections were overcome by Meleager, who was in love with her. The hunt began at once; Ancaeus and Cepheus were killed by the boar; Peleus killed Eurytion by accident. Then Atalanta gave the boar the first wound, Amphiaraus pierced his eye with an arrow, and the monster was finally killed by Meleager, who gave the head and hide to Atalanta. Meleager's uncles, the sons of Thestius, took the hide away from Atalanta, and were killed by Meleager. Althæa, enraged by the death of her brothers, burned the brand upon which her son's life depended, and Meleager wasted away and died. Althæa took her own life, Cleopatra died of grief, and Meleager's sisters, with the exception of two, were changed into birds called Meleagrides. The later legend is told in Swinburne's *Atalanta in Calydon*.

MELEAGER, a Greek epigrammatist in the 1st c. B.C. He compiled the first known Greek anthology, a collection called *The Garland*, and containing specimens from 46 authors. His anthology has been lost, but 131 of Meleager's own epigrams have been preserved. They are remarkable for their purity of style and grace of versification. The best edition is that published at Leipsic, by Graefe, in 1811.

MELEAGRIDI'DÆ. See TURKEY, *ante*.

MELEGNA'NO, or MALEGNANO, formerly MARIGNANO, a town of northern Italy, 10 m.s.e. of Milan, has a pop. of 5,000. It is famous as the scene of a great victory won by Francis I. of France over the Swiss and Milanese in the month of September, 1515; upwards of 20,000 men were slain. This conflict has been termed *the Battle of the Giants*. Francis accepted the honor of knighthood on the field from the chevalier Bayard. A second battle was fought here June 8, 1859, between a French force of 16,000 men, under marshal Baraguay d'Hilliers, and a rather larger body of Austrian troops, in which the latter were routed with a loss of about 1,400 killed and wounded.

MELENDEZ VALDES, Don JUAN, one of the most distinguished of the modern Spanish poets, was b. Mar. 11, 1754, at the village of Ribera del Fresno, in Estremadura. He studied at Madrid and subsequently at Salamanca, where he became intimate with the poet Cadalso, and acquired a thorough knowledge of English. It was Locke, he said, who first taught him to reason, and his writings contain imitations of Pope, Thomson, and Young. In his earlier period he wrote admirable anacreontics in praise of student-life; his descriptive poetry is also excellent. His style and sentiment are simple and natural; and the national idioms are used with singular grace and vigor. The first collection of his verses appeared in 1785, and soon became very popular. Four years before this publication Melendez Valdes was appointed a professor at Salamanca, and high political honors even seemed in store for him, but during the French invasion he allowed himself to be cajoled by Murat, and afterwards by Joseph Bonaparte; a weakness which was as disastrous to his prospects as it was discreditable to his character. When the invaders were driven out of the peninsula the unhappy poet was forced to accompany them. He died a proscribed traitor, at Montpellier, May 21, 1817. Melendez Valdes's anacreontics are the writings on which his fame rests, and they have procured for him the title of *Restaurador del Parnaso*.

MELETIUS, SAINT, of Antioch, a famous Greek ecclesiastic; b. in the beginning of the 4th c. at Melitene in Armenia Minor. His first important appointment was to the bishopric of Sebaste on the deposition of Eustathius in A.D. 357, but his position was made so unpleasant by the stubborn conduct of the people that he soon resigned, and retired to Berœa or Aleppo in Syria. The Arian controversy was now engrossing the minds of the people, and extinguishing true piety, but Meletius endeavored by his ministrations in the pulpit and his consistent private life to commend to his people the essential truths of the gospel. He thus won the respect of both factions, and in A.D. 360 was raised by universal consent to the see of Antioch. In his new and high position he felt bound to take a decided course in the prevailing dispute, and in his inaugural discourse in 361 he expressed his sympathy with the orthodox party. This confession re-awakened the spirit of controversy in the church of Antioch. The Arians charged him with Sabellianism and other crimes, and in a month he was banished by command of the emperor Constantius to his native Melitene. Euzoius was installed in his place. The orthodox party in the church of Antioch seceded from the communion of the Arians, and on the accession of the emperor Julian in 362 Meletius was recalled from exile. He now strove earnestly for two years to effect a union between the Eustathians and the orthodox party that had separated from the Arians at the time of his banishment, but the Eustathians refused to recognize any bishop who had been consecrated by the Arians. The council of Alexandria sent Lucifer of Cagliari to Antioch to settle the dispute, but he defeated the plan of reconciliation by ordaining Paulinus bishop of the Eustathians. Soon after the accession of Valens in 364 Meletius was again banished. By an edict of Gratian in 378 he was recalled, and reinstated in his bishopric. He again endeavored to effect a union with the Eustathians, but was unsuccessful through the unrelenting prejudice of Paulinus. Meletius died at an advanced age, while in the council of Constantinople in 381. His body was taken to Antioch and buried with great honor beside the tomb of the martyr Babylas. His funeral oration was pronounced by Gregory of Nyssa. A part of the inaugural discourse of Meletius at Antioch is printed in the fifth vol. of Galland's *Bibliotheca Patrum*.

MELETIUS, or MELITIUS; b. in Egypt about 260; was bishop of Lycopolis in Thebais in the beginning of the 4th c., and founder of the sect of the Meletians. During the severe persecution under Diocletian and Maximin, he and Peter, archbishop of Alexandria, were thrown into prison. Many Christians who had been led through torture to renounce their faith, repenting of their sin, repaired to the two bishops to receive absolution, and to be reconciled to the church. Peter was willing to receive the backsliders, on their doing penance, but Meletius refused to have any intercourse with them until the close of the persecution. A majority of the imprisoned Christians approved of his course. This caused a schism, and Meletius became the leader of the disaffected. After obtaining his freedom he traveled through the patriarchate, ordaining and excommunicating according to his own will, obtaining many followers, and disregarding the protests of the Egyptian bishops. This proselyting tour was extended to Palestine. But in 325 the council of Nice checked his career, compelling him to remain at Lycopolis as a mere titular bishop without active jurisdiction. He died soon after this. The Meletians called themselves *the church of the Martyrs*. They afterwards allied themselves with the Arians against Athanasias, continuing, however, a distinct sect until the 5th century.

MEL'FI, an ancient episcopal town of southern Italy, in the province of Potenza, 33 m. s. of Foggia, on a feeder of the Ofanto (anc. *Aufidus*). It is situated on a bed of lava to the n.e. of the lofty (3,000 feet) volcanic Monte Volture, now extinct, from which it is separated by a deep ravine. The once magnificent cathedral, erected in 1155, was almost entirely destroyed by an earthquake in 1851, which at the same time leveled many fine buildings, public and private, and destroyed about 1000 persons. The only evidences of volcanic action are the severity of the earthquakes which occasionally desolate the district, and the emission at times of carbonic acid and other gases from the lakes in the old crater of the volcano, throwing up columns of water, accompanied by internal rumblings. This phenomenon generally takes place when Vesuvius is in a state of activity. The district around the city is celebrated for its wine. Pop. 11,225.

MELIA'CEÆ, a natural order of exogenous plants, containing nearly 200 known species, trees and shrubs, natives of warm climates, and mostly tropical. Many of the species possess bitter, astringent, and tonic properties; some are used in medicine; the seeds of some yield useful oil; some are poisonous; some yield pleasant fruits; the wood of some is valuable. See CARAPA.—The lanseh is the most esteemed fruit of this order; and next to it is *milnea edulis*, a fruit of the n.e. of India, of which the edible part is the large succulent aril.—The CAPE ASH (*ekebergia capensis*) deserves notice among the timber trees of this order. It has a trunk two feet in diameter, and yields excellent tough timber, useful for many purposes.—*Melia azedarach*, a tree about forty feet high, with large bipinnate leaves, a native of Syria and other parts of the east, has long been much planted as an ornamental tree in the s. of Europe, and is now common in the southern states of North America. Its flowers are in large spikes, and very fragrant. The fruit is of the size of a cherry, somewhat elongated, pale yellow, containing a brown nut. The nuts are bored and strung for beads in Roman Catholic countries, whence the tree is often called BEAD TREE. It is also known as the *pride of India*, and is sometimes erroneously called *Persian lilac*. The fruit is sweetish, and not poisonous, although very generally reputed so. The bark of the root, which is bitter and nauseous, is used as an anthelmintic. The pulp of the fruit of the NEEM TREE or MARGOSA TREE (*azadirachta Indica*) yields a fixed oil, which is bitter, stimulant, and anthelmintic. The bark is a valuable tonic. The leaves are universally used in India for poultices.

MELIC GRASS, *Melica*, a genus of grasses, having a lax panicle, and spikelets of 2 to 5 awnless florets, of which one is generally imperfect. *M. uniflora* is a common grass in Britain, growing in the shade of woods. It is of a graceful and delicate appearance. Cattle are fond of it. *M. nutans* is a rarer British species. *M. altissima*, a Siberian species, growing to the height of 3 or 4 feet, has been introduced in some parts of Europe, and yields a considerable bulk of herbage. It is perennial.

MELICOC'CA, a genus of trees or shrubs of the natural order *sapindaceæ*, one of which, *M. bijuga*, a native of the West Indies, is there universally cultivated for its fruit. It is called the HONEY BERRY, and the *Jamaica bullace plum;* by the Spaniards *monos*, and by the Dutch *knipnee*. It is from 16 to 20 ft. high. The fruit is jet black, about the size of a bullace. The seeds are roasted, and eaten like chestnuts. Other species of melicocca yield eatable fruits.

MELIKOFF, LORIS, MICHAEL TARIELOVITCH, b. Russia, 1826; descended from a wealthy family of the Caucasian nobility. He was educated in the school of the guards of St. Petersburg, and joined the army with the rank of cornet, being promoted to a lieutenancy in 1847. He saw active service in the Caucasus, as adjutant to prince Vorowzoff, and gained a reputation for remarkable military talents. Here he led a number of expeditions against the fierce native soldiery, and had even the honor of defeating the celebrated Shamyl. During the Crimean war he had several successful engagements with the enemy in front of Kars, and on the capitulation of that stronghold was appointed its governor. In 1856, at the close of the war, he was made a maj.gen., and in 1863 lieut.gen. He was appointed adj.gen. in 1865, and gen. of cavalry in 1875; and in the following year was placed in command of the corps which was stationed on the Turkish frontier, and, on the declaration of war, marched into the enemy's territory. He besieged Kars and encountered serious resistance, being forced to retire; he, however, received reinforcements, defeated the Turkish army before Kars, and captured the fortress by storm. In 1880 the nihilist movements having become alarming, and the danger of Russia being apparently imminent, the czar Alexander appointed Melikoff to a position of absolute authority and power—an actual dictatorship without responsibility—in which delicate and dangerous situation he conducted himself in such a manner as to command the admiration of the statesmen of Europe. He restored order in a great measure where anarchy had been impending; and wielded his unlimited authority with such firmness and judgment as to fully sustain the wisdom of his appointment.

MEL'ILOT, *Melilotus*, a genus of clover-like plants of the natural order *leguminosæ*, with ternate leaves, differing from the clovers in the generally elongated racemes of flowers, the stamens not adhering to the corolla, and the 1 to 4 seeded tumid pods. All the species have a strong peculiar sweetish smell, which becomes more agreeable when they are dried, and is owing to the presence of coumarin (q.v.)—The COMMON YELLOW MELILOT (*M. officinalis*) is found in bushy places and the borders of fields in Britain

and most parts of Europe. It has an erect stem, two or three ft. high, and long loose axillary racemes of yellow flowers. A water distilled from the flowers is used in perfumery. The herbage is relished by cattle, but the produce is not large. It is an annual, but if frequently mowed without being permitted to flower, lives for several years.—The WHITE MELILOT (*M. vulgaris* or *leucantha*), common in some parts of Europe, has become naturalized in many places in Britain.—The BLUE MELILOT (*M. cærulea*), a native of the n. of Africa, with short racemes of blue flowers, is cultivated in many parts of Europe, particularly in Switzerland and the Tyrol, and has the peculiar melilot odor in a high degree. It was formerly much used in medicine as an anodyne, discutient, diuretic, sudorific, expectorant, and vulnerary; and to the many good qualities supposed to belong to it may be ascribed the high estimation in which the *schabzieger* or *chapzieger* cheese of Switzerland is held, to which it imparts its flavor. Where this cheese is made in considerable quantities the smell of melilot can be discerned even at a distance.—BOKHARA CLOVER (*M. arborea*) has attracted attention on account of the fiber of its stem, which is used for the same purposes as hemp.—The MESSINA MELILOT (*M. messinensis*), a native of the countries near the Mediterranean, is believed to be one of the plants called *lotus* by the ancients.

MELIORA'TIONS, the name used in Scotch law to denote the improvements made by a tenant to the estate or farm which he occupied. If the lease is terminated prematurely and abruptly he is entitled to compensation from the landlord for the value of the improvements; it is otherwise in England. Similar claims exist in Scotland in case of heirs of entail or life-renters improving the estate.

MELIPHAG'IDÆ. See HONEY-EATER.

MELIS'SIC ACID AND **MELISSIN.** See WAX.

MELISSUS, of Samos. See ELEATIC SCHOOL.

MELITA. See MALTA.

MELL, PATRICK H., D.D., LL.D., b. Ga., 1814. Left a destitute orphan by the death of his parents at the age of 14, but having received a good elementary education he earned the means to support himself for two years at Amherst college. He became a Baptist minister, and soon after the opening of Mercer university he was appointed professor of ancient languages. In 1851 he was called to the same professorship in the state university, and subsequently became vice-chancellor, resigning in 1872, but retaining the professorship. He was for 15 years president of the Georgia Baptist convention, and for 9 years of the southern Baptist convention. His published works are *Baptism; Corrective Church Discipline; Predestination; Essay on Calvinism; An Argument on the Subject of Slavery; A Sermon on God's Providential Government; a Treatise on Parliamentary Practice; Prayer as Related to Providence.*

MELLEN, GRENVILLE, 1799–1841; b. in Biddeford, Me.; son of chief-justice Mellen; educated at Harvard and, after graduating in 1818, studied law and engaged in practice in North Yarmouth. He was a poet of much taste and some power, and also a magazine writer. Besides many occasional pieces, such as *The Rest of Empires*, read in 1826 before the Maine peace society, he published, in 1827, *Our Chronicles of Twenty-six*, a satire; *Glad Tales and Sad Tales* (1829), a collection of prose papers; and, in 1833, *The Martyrs' Triumphs* and other poems. In New York he began the issue of a *Monthly Miscellany*, which failed after a few numbers. Mr. Mellen had long been a sufferer from consumption, and in 1840 made an unavailing voyage to Cuba for his health.

MELLEN, PRENTISS, LL.D., 1764–1840; b. at Sterling, Mass.; educated at Harvard, where he graduated in 1784, and began the practice of law at Bridgewater, Mass. He afterward resided in Biddeford and Portland, Me. In his profession he soon acquired a high standing and took an active part in political movements. From 1817 to 1820 he was one of the United States senators from Massachusetts. In 1820 he was made chief-justice of the supreme court of Maine, which position he held for 14 years.

MELLONI, MACEDONIO, 1800–54; b. Italy; began the study of natural philosophy at school, and had already entered upon extensive experiments in regard to the radiation of heat, when, in 1824, he was called to the chair of natural philosophy in the university of Parma. In 1831 he was forced for political reasons to leave Parma and remove to France. His discoveries in the radiation of heat he laid before the French academy of sciences, in a memoir to which that body paid little attention; but the English royal society deemed it worthy of the Rumford medal. Through the influence of his friends Arago and Humboldt, Melloni was allowed to return to Italy, and was appointed by the king of Naples director of the meteorological observatory on Mt. Vesuvius. Here he discovered the existence of heat in the lunar light. In 1849, though he had taken no active part in politics, he was dismissed from his position in the observatory, on account of his known liberal views. He lived thenceforward in his villa at Partici, near Naples, continuing his experiments. In 1850 appeared the first volume of his *La Termocrosi*, dedicated to Arago and Humboldt. He disputed the theories of Faraday as to the diminished velocity noticeable in an electric current passed through wires under ground, or under water, in comparison with an equal current passing through wires in the air.

MELMOTH, WILLIAM, 1666–1743; b. England; called to the bar in 1719, and a bencher of Lincoln's Inn, of which he was treasurer in 1730. He was associated with Peere Williams in the publication of Vernon's chancery *Reports*. He is, however, best known by his work *The Great Importance of a Religious Life Considered*, which was exceedingly popular in the last c., and of which over 100,000 copies are said to have been sold. It appeared anonymously, and was for a time ascribed to the first earl of Egmont. *The Memoirs of William Melmoth* was published by his son William in 1796.

MELMOTH, WILLIAM, 1710–99; b. England; son of William; called to the bar, and in 1756 made a commissioner of bankrupts; but he paid little attention to the practice of his profession, devoting his ample leisure to the cultivation of literature. Two volumes of *Letters on Several Subjects* appeared from his pen in 1742, under the pseudonym of sir Thomas Fitzosborne. They deal with a variety of subjects, chiefly literary and ethical. Five years later he published a translation of the *Letters* of Pliny, which is a model of elegance and exactness. This was followed in 1753 by a translation of Cicero's *Letters*, and in 1773 and 1779 by translations, with full notes, of the *De Amicitia* and *De Senectute*. He also wrote a treatise on the Christian religion; a poem on *Active and Retired Life*, which may be found in Dodsley's *Poems*; and a memoir of his father, which appeared in 1796 as *Memoirs of a late Eminent Advocate*.

MELO or MELLO, FRANCISCO MANUEL DE, 1611–65; b. Portugal; entered the army and became col. He was sent to suppress the insurrection in Catalonia against Philip IV. He entered the service of Portugal after its separation from Spain, but, falsely accused of murder, he was imprisoned, and for years was an exile in Brazil. He wrote in Spanish at the request of Philip IV. a history of the Catalonian revolution entitled *Historia de los Movimientos, Separacion y Guerra de Cataluña*, 2 vols. More than 100 volumes of his works have been printed. He wrote also several dramas and poems, the best of which was *Las tres Musas de Melo dino*.

MELODEON. See REED INSTRUMENTS.

MELODRAMA (Gr. *melos*, a song, and drama) strictly denotes a half-musical drama, or that kind of dramatic performance in which declamation is interrupted from time to time by instrumental music. The name, however, was first applied to the *opera* by its inventor, Ottavio Rinuccini. In Germany the melodrama retains its primitive character; but both in France and England the name has come to designate a romantic play, generally of a serious nature, in which great prominence is given to splendid decoration, to sensational incidents, and to an effective dénouement.

MELODY (Gr. sweet song) is a succession of musical notes regulated so as to be pleasing to all cultivated ears, and expressive as a whole of some particular feeling. It is opposed to harmony, in which different notes, being chords, are sounded together. The part intended for the leading voice in a harmonized piece of music is often called the *melody* or *air*. The character of a melody depends in a great degree on the rhythm and measure, as the same succession of sounds may, by the slightest change in the power of the notes, be so altered in character as to produce a different effect.

MELON, *Cucumis melo*, a plant of the same genus with the cucumber (q.v.), much cultivated for its fruit, which is sweet, with a delicious though peculiar flavor and smell. The melon is an annual, with trailing or climbing stems, lateral tendrils, rounded angular leaves, small, yellow, monœcious flowers, and large round or somewhat ovate fruit. It is supposed to be a native of the sub-tropical parts of Asia, although it has never been discovered in a wild state, and it was first introduced into England from Jamaica about 1570. It is said to derive its name from the Grecian island Melos. Its English name was originally *musk melon*. The varieties in cultivation are very numerous, some of them distinguished by a thick and warty rind, some by a rind cracked in a net-like manner, some by ribs and furrows, some by a perfectly smooth and thin rind; they differ also in the color of the *flesh* of the fruit, which is green, red, yellow, etc.; and in the size of the fruit, which varies from 3 or 4 in. to a foot or more in diameter. The melon is eaten either by itself or with sugar, and sometimes with pepper or ginger. The melon can be grown in the open air only in the most southern parts of Britain, and even there requires a hot-bed in spring. Its cultivation in hot-beds is extensively carried on in all parts of Britain, and very great care is bestowed on it. A loamy soil is best suited to it. The *setting* of the fruit by dusting the female flower with the pollen of the male flower is constantly practiced by gardeners. Warmth and bright sunshine are requisite to the production of fruit of good quality.—The WATER-MELON or CITRUL (*cucumis citrullus*), although rarely cultivated in Britain, is highly esteemed and much cultivated in almost all warm countries. It is a native of the warm parts of the old world. It has deeply lobed and gashed leaves, and a large round fruit with smooth dark-green spotted rind, and pink or white flesh; less sweet than the melon, but much more juicy or watery, and therefore much prized in many warm countries, not merely as an article of food, but for quenching thirst and allaying fever.—South Africa has another species of water-melon (*C. Caffer*), very valuable to the inhabitants.—The CHATE (*C. chate*) is a native of Egypt and Arabia. Its taste is sweet, and as cool as the water-melon.—The KAUKOOR (*C. utilissimus*) is a native of India, and much cultivated in some parts of that country; it has oval fruit, smooth, variegated with different shades of

yellow, and about 6 in. long, with much the flavor of the melon. The fruit will keep for several months, and is much used both raw and in curries. The half-grown fruit is pickled. The seeds contain much farina and oil, and are ground into meal; the oil is also expressed, and used both for food and in lamps. The seeds of others of this genus may be used in the same way; and they are said to be useful as a diuretic medicine, and for relief of strangury.

MELO'RIA, a small island of the Mediterranean, about 5 m. in length and 1 in breadth, 4 m. from Leghorn. In 1284 the Genoese gained a famous naval victory over the Pisans in the vicinity of Meloria, by which the latter were deprived of their maritime supremacy. An ancient Pisan tower stands on a rock to the s. of Meloria.

MELOS, or MILO, an island of the larger Cyclades in the Grecian archipelago, or Ægean sea, about 70 m. n. of Crete, and 65 m. e. of Peloponnesus; pop. 4,000. It is 14 m. long, and 8 broad, and has on its n. coast one of the best and safest natural harbors in the Levant. The surface is generally mountainous, and of a volcanic character, and there are hot mineral springs, and deposits of sulphur. The soil is fertile, and produces largely in fruit, wine, and oil, while affording also excellent pasturage for cattle. In the e. part of the island, near the port, is the chief town, called Milo; and near are extensive remains of the ancient capital of the island. Near the sea the ground is marshy, and the air is unwholesome in summer. This island is said to have been colonized first by the Phenicians, and afterwards by the Lacedœmonians. An attempt made by the Athenians to reduce it during the Peloponnesian war, was unsuccessful, but some years later they besieged the town, put the adult males to death, carried away the women and children into slavery, and occupied the place by a colony of Athenians. Melos fell successively under the dominion of the Romans, the Byzantine emperors, Venice, and the Turks: it is now a part of Greece. In 1820 admiral Dumont found in Melos the since celebrated statue known as the "Venus of Milo," and which now stands in the Louvre. This statue was without arms when found, and in 1877 it was reported that the lost members had been found near the locality where the statue was originally discovered. The highest eminence on the island is Mt. St. Elias, 2,538 ft. high. The Cyclades group of islands are believed to have formed in antediluvian times a part of a continuous chain of mountains connected on the n. with the mountains of Attica, and by the island of Melos with the western mountains of Candia on the south. Between Melos and Argentiera, a rocky island to the n., is a channel half a mile wide, which has an evil notoriety for its peculiarly dangerous character.

MELPOM'ENE (the Singing One), one of the nine Muses, specially invoked as the muse of tragedy.

MELROSE, a t. in Middlesex co., Mass., 8 m. n.w. from Boston, on the Boston and Maine railroad; pop. 3,414. It has seven churches, 14 public schools, 2 post-offices, a public park, a library, 1 weekly newspaper, a volunteer fire department, and manufactures of furniture, boots and shoes, sewing-machine needles, silver polish, etc. It is supplied with water from Spot pond. It is pleasantly situated, and is an attractive place for residence of business men from Boston.

MELROSE', a pleasant village at the foot of the Eildon hills, on the s. bank of the Tweed, having a population of 1405 at the census of 1871. It is famous for the ruins of its noble Cistercian abbey, founded by king David I. in 1136. The original pile having been destroyed during the wars of the succession, the monastery began to be rebuilt about 1326. The work was helped by large grants from king Robert Bruce, and his son king David II., but proceeded so slowly that it was scarcely finished at the reformation, in the middle of the 16th century. It was in the second pointed style, with one or two approaches to third pointed, and was beyond doubt the most beautiful structure of which Scotland could boast in the middle ages. What now remains are the chief portions of the conventual church, measuring 251 ft. in length, and some fragments of the cloister, which would seem to have been a square 150 ft. deep. The tracery and carvings, cut in stone of singular excellence, are scarcely surpassed by any in England. In the pages of Scott, Melrose shines with a splendor which its meager history fails to sustain. Its line of abbots showed one saint, St. Waltheof, the stepson of its royal founder. King Alexander II. chose his sepulture within its walls; Bruce left it the legacy of his heart; and it gave tombs to that flower of Scottish chivalry, the knight of Liddesdale, and to his kinsman, the heroic Douglas who fell at Otterburn. But its annals have little else to record. As a seat of piety and learning, its renown is eclipsed by the older and humbler monastery founded by St. Aidan, about the middle of the 7th c., and commemorated by the Venerable Bede as the home of Eata, of Boisil, of Cuthbert, and of Drycthelm. "Old Melrose," as it was called after the 12th c., stood about two m. below the modern abbey, on a beautiful promontory almost encircled by the Tweed. It was burned by Kenneth, king of Scots, in 839, and seems never to have recovered the blow. After it had lain waste for many years, we hear of it about 1073, as giving shelter, for a short season, to a few fugitive monks. All that survived the erection of the later abbey was a chapel dedicated to St. Cuthbert, and still famous about the middle of the 15th c. as a resort of pilgrims. The *Chronica de Mailros*, a series of brief obits and annals from 731 to 1275, has been twice printed, first among the *Quindecem Scriptores*

Historiæ Anglicanæ, published by bishop Fell at Oxford in 1684; and again by Mr. Joseph Stevenson, for the Bannatyne club, at Edinburgh in 1835. The charters of the more modern abbey were printed by Mr. Cosmo Innes, at Edinburgh in 1837, for the same society, at the cost of the duke of Buccleuch, in two sumptuous quartos, with the title of the *Liber S. Marie de Melros*.

MELTON-MOW'BRAY, a market-town of England, in the county of Leicester, and 16 m. n.e. of the town of that name, on the Eye near its junction with the Wreak, which is navigable to the Soar-Navigation, about 11 m. above the town. Stilton cheese is manufactured, and pork-pies are extensively made, chiefly for retail in the London, Manchester, and Leeds markets. In the vicinity are numerous hunting-seats, and the town, with stabling accommodation for 800 horses, is the central rendezvous of the famous Melton hunt. There are breweries, tanneries, and 5 banks. Pop. '71, 5,011.

MELUN, an ancient t. of France, capital of the department of Seine-et-Marne, built on an island and on both banks of the Seine, 28 m. s.e. of Paris. The manufactures are cement, bricks, tiles, and hats, and there is a trade in timber, grain, and flour. Melun, the *Melodunum* of the Romans, was stormed five times during the 9th c. by the Northmen, and fell into the hands of the English after a siege of six months, in 1419, and was held by them for ten years. Pop. '76, 11,315.

MELVIL, Sir JAMES, OF HALLHILL, 1535–1617, was the third son of sir John Melvil or Melville of Raith, Scotland, who was convicted and executed at Stirling on charges of high treason brought by archbishop Hamilton, on account of his devotion to the principles of the reformation. His estates were confiscated and the widow and children reduced to poverty. Young Melvil was sent to France and became page of honor to the bishop of Valence, and was afterwards attached to the service of the constable Montmorenci. Under him he saw his first military service in Flanders in 1553, and in 1557 was taken prisoner at the battle of St. Quentin after the defeat of the constable's forces. Two years afterwards he obtained his release and was dispatched to Scotland on a secret mission. During his absence occurred the tournament in which Montmorenci had the ill fortune to kill Henry II.; and at Melvil's return he judged it best to turn his steps towards Germany, where he was employed by the elector palatine. While on a visit to France in 1561 he for the first time met queen Mary of Scotland, to whom he tendered his allegiance and sword; and in 1564, having received a summons through Moray, he returned to his native land and presented himself to Mary at Perth. Shortly afterwards he was sent to England as ambassador to queen Elizabeth, and the account given in his memoirs of this embassy is of great historical value. Again in 1566 he was sent to England to bear the news of the birth of an heir to the Scottish throne. In the eventful period which followed, Melvil displayed much prudence and policy. He adhered to the queen so long as there appeared to be any hope of her ultimate success, but after she was committed to Lochleven castle, was received into some favor by the regency; but not being a favorite of the earl of Arran, his name was struck off the list of privy councilors. In 1590 he was attached to the queen's household. *The Memoirs of Sir James Melvil of Hal-hill; Containing an Impartial Account of the most Remarkable Affairs of State during the last Age, etc.*, was published in 1683 by his grandson, George Scott. This edition differs in many respects from a manuscript afterwards found, in what is thought to be sir James's handwriting; the latter was printed in 1827 at Edinburgh.

MELVILL, HENRY, D.D., 1800–71; b. at Pendennis castle, Cornwall, England; educated at St. Peter's college, Cambridge, where he took his degree in 1821. After taking orders he became the incumbent of the parish of Camden chapel, in London; and filled successively the offices of principal of the East India college, chaplain of the Tower of London, chaplain to the queen, 1853, canon of St. Paul's, 1856; and in 1863 became rector of Barnes, and a rural dean. His reputation, both as a finished and elegant writer and as a pulpit orator of power and eloquence, gave him a very high position among the English clergy. In 1848 he was elected incumbent of what is known as the golden lectureship of St. Margaret's. A great number of his lectures and sermons have been published in England and republished in this country. Of these the *Golden Lectures* and a number of others were printed without his consent. In 1847 a New York house published in two volumes 68 sermons, printed with the consent of the author. We may also note *Voices of the Year; Golden Counsels* (1857); and *Persuasions to a Christian Life*, as among the best of his writings. Melville is described by the author of *Random Recollections* as "certainly the greatest rhetorician among our metropolitan preachers. He clothes the most commonplace ideas in language which is so rich in the ornaments of rhetoric that they are often mistaken for conceptions of the most brilliant character. He is exceedingly partial to the use of analogy in addressing his hearers. And his analogies are often exceedingly happy; at times they are particularly striking. . . . . He arrests the hearer's attention the instant he begins, and carries him with him, a willing captive, to the close of his sermon." A severe taste will sometimes consider his analogies extreme in their range.

MEL'VILLE, the name of an island, a sound, and a peninsula in the n. polar regions of America. The island is in lat. between 74° 30′ and 77° n., long. between 105° 40′ and 117° 30′ west. Greatest length, 200 m.; greatest breadth, 130 m. It is separated on the

west by Fitzwilliam and Kellet straits from Prince Patrick island, the most western island of these regions. In 1819 lieut. Parry, who gave its name to Melville island, passed the winter here with his crews, in the vain hope of finding in summer a passage westward to the Pacific. Melville sound, about 250 m. long by 209 m. broad, extends immediately south-east of Melville island. It communicates with the Arctic ocean on the west by Banks's strait, and with Baffin's bay on the east by Barrow strait and Lancaster sound. Melville peninsula, abutting from the continent of British North America, is bounded on the north by Fury and Hecla strait, and connected with the main land by Rae isthmus. It is 250 m. in length by about 160 m. in average breadth. Lat. 66° 10′ to 69° 50′ n., long. 81° to 87° west.

MELVILLE, ANDREW, an eminent Scottish reformer, was b. Aug. 1, 1545, at Baldovy, on the banks of the South Esk, near Montrose. He was educated at the grammar school of Montrose, whence he removed in his fourteenth year to the university of St. Andrews. Here he remained four years, and left it with the reputation of being "the best philosopher, poet, and Grecian of any young master in the land." He then proceeded to Paris, where he continued his studies for two years. His reputation must have been already considerable, for in his twenty-first year he was chosen regent in the college of St. Marceon, Poictiers, whither he had gone a perfect stranger, to acquire a knowledge of law. Some time afterwards he proceeded to Geneva, where he was more in his element, both politically and religiously, and where, by the influence of his friend Beza, he was appointed to the chair of humanity in the academy. He returned to Scotland in 1574, and was, in the course of the same year, appointed principal of the university of Glasgow, where his scholarship, energetic discipline, and intrepidity of character exercised a most quickening and elevating influence. When the regent Morton exclaimed on one occasion, "There will never be quietness in this country till half a dozen of you be hanged or banished," Melville is said to have replied: "Tush, man; threaten your courtiers so. It is the same to me whether I rot in the air or in the ground; and I have lived out of your country as well as in it. Let God be praised, you can neither hang nor exile his truth!" In 1580 Melville was chosen principal of St. Mary's college, St. Andrews. Here, "besides giving lectures on theology, he taught the Hebrew, Chaldee, Syriac, and rabbinical languages." In 1582 he preached the opening sermon before the general assembly, and boldly "inveighed against the bloody knife of absolute authority, whereby men intended to pull the crown off Christ's head, and to wring the scepter out of his hand." The assembly applauded his intrepidity, drew up a remonstrance in a similar spirit, and appointed Melville and others to present it. In less than two years Melville was summoned before the privy council, on account of a sermon preached at St. Andrews. He declined to appear, maintaining that whatever a preacher might say in the pulpit, even if it should be called treason, he was not bound to answer for it in a civil court, until he had been first tried in a church court. For this denial of secular jurisdiction he was condemned to imprisonment, but escaped to London, where he remained till the downfall of Arran in the following year. After an absence of twenty months he returned to Scotland and resumed his office at St. Andrews. He was repeatedly elected moderator of the general assembly and rector of the university. A remarkable instance of his plain speaking took place at Cupar in 1596. Melville was heading a deputation to "remonstrate" with the king. James reminded the zealous remonstrant that he was *his* vassal. "Sirrah!" retorted Melville, "ye are *God's* silly vassal; there are two kings and two kingdoms in Scotland—there is king James, the head of this commonwealth; and there is Christ Jesus, the king of the church, whose subject James the Sixth is, and of whose kingdom he is not a king, nor a lord, nor a head, but a member." In 1605 Melville was called to England to attend the famous conference at Hampton court. Having ridiculed the service in the chapel royal in a Latin epigram, he was summoned before the English privy council, where his temper gave way, and he broke out into a torrent of invective against the archbishop of Canterbury for encouraging popery and superstition, profaning the Sabbath, etc. The king, violating every principle of justice, immediately sent him to the Tower, where he remained for more than four years. In 1611 he was released on the solicitation of the duke of Bouillon, who wanted his services as a professor in his university at Sedan in France. Melville, now in his sixty-sixth year, would fain have gone home to Scotland to lay his bones there, but the king would on no account hear of such a thing; and he was forced to spend his old age in exile. Melville died about 1622, but neither the date of his death nor the events of his last years are ascertained. See *Life of Andrew Melville* by Dr. M'Crie (2 vols. 1819).

MELVILLE, HERMAN, an American author, was b. in New York, Aug. 1, 1819. At the age of 18 he shipped as a common sailor on a voyage to Liverpool; and in 1841 he went again before the mast on a whaling voyage to the Pacific. Ill-treated by the capt., he deserted at Nukaheva, Marquesas islands, and was kept four months as the prisoner of a savage tribe in the Typee valley, whence he was rescued by an Australian whaler, and taken to Tahiti. After visiting the Sandwich islands he shipped on a U. S. frigate, and returned to Boston in 1843. In 1846 the first literary result of his adventures was published in *Typee*, a spirited account of his residence in the Marquesas. *Omoo*, a continuation of his adventures in Oceania, appeared in 1847, in which year he married a

daughter of chief-justice Shaw of Massachusetts. *Mardi*, a strange philosophical romance, in 1848, was followed by *Redburn* in 1849; *White Jacket, or the World in a Man-of-War*, 1850; *Moby Dick, or the White Whale*, 1851; *Pierre, or the Ambiguities*, 1852; *Israel Potter*, 1855; *The Piazza Tales*, 1856; and *The Confidence Man*, 1857. In 1860 he embarked in a whaling vessel for a new tour round the world. *Battle Pieces* (1866) appeared after his return.

MELVILLE, VISCOUNT. See DUNDAS.

MELVILLE ISLAND, off the n.w. coast of Australia, from which it is separated on the e. by Dundas strait and on the s. by Van Diemen's gulf and Clarence strait, while Bathurst island lies to the w., being separated from Melville island by Apsley strait; it is 70 m. in length and 30 m. wide, and extends from lat. 11° 8′ to 11° 56′ s., and from long. 130° 20′ to 131° 34′ east. The coast is in general high and steep, the surface being in great part table-land, though it rises to the height of 150 or 175 ft. in the central part. The *fauna* and *flora* in general correspond to those of Australia. The natives are superior to those of the continent both in physique and in mental capacity. The climate is, of course, very warm, and during the wet season is not healthful.

MEMBERED, in heraldry. When a bird has its legs of a different color from its body, it is said to be membered of that color.

MEMBERTOU, HENRY, 1500–1611: b. Canada; a medicine-man in the Micmac tribe. He was friendly to the French colonists who arrived in 1604, and fought a number of Indian tribes hostile to the French. Lescarbot wrote a poem in honor of the victory gained by Membertou in 1607 over the Armouchiquois, a tribe in the vicinity of the Merrimac river. Three years later he, his wife, and three sons were baptized as Christians. The next year, under the care of the French missionaries, he died at Port Royal at the estimated age of 110.

MEMBRA'NA PUPILLA'RIS, the name given to a very thin membrane which closes or covers the central aperture of the iris in the fetus during a certain period of gestation, but which disappears in the seventh month.

MEM'BRANE, in anatomy. This term is applied to designate those textures of the animal body which are arranged in the form of laminæ, and cover organs, or line the interior of cavities, or take part in the formation of the walls of canals or tubes. The structure and special uses of some of the most important of the animal membranes are noticed in separate articles, such as MUCOUS MEMBRANE, SEROUS MEMBRANE, etc.; and the membranes in which the fetus is inclosed—commonly called the fetal membranes—are described in the article PLACENTA. The membranes which cover and protect the brain and spinal cord are commonly termed *meninges*, from the Greek word *menina*, a membrane.

MEMBRANE, (*ante*), a name given to different thin organs, in the form of supple, more or less elastic tissues, for the purpose of enveloping or separating other organs, and in many cases, of secreting certain fluids. Bichat divided membranes into simple and compound. Simple membranes are of three kinds, mucous, serous, and fibrous. Mucous membranes line the cavities which communicate externally with the skin, as the mouth, intestinal canal, genito-urinary passages, internal surface of the eyelids, and the ramifications of the respiratory passages, the eustachian tubes and middle ear. Mucous membrane has three layers; a fibro-vascular layer, composed of blood-vessels, nerves, and connective tissue, which is continuous with the tissue beneath and interlacing with it; a more superficial layer, called basement membrane, which is described as structureless, and upon which rests the superficial layer, or epithelium, the latter presenting a variety of structure in various parts of the body. The two lower layers, the fibro-vascular and the basement membrane are continuous with the two lower layers of the skin, in reality forming the same organ, which passes under the common name of corium. The basement membrane is not in all localities susceptible of demonstration. The epithelium is composed of numerous cells called epithelial cells of various forms. The chief purpose of the mucous membranes are to secrete mucus to lubricate the various passages, at the same time that the mucous fluid performs other physiological offices. The salivary mucus, to some extent, aids digestion, and the digestive fluid (gastric juice) is a species of mucus; so also is the pancreatic fluid, and the product of the various intestinal glands. See EPITHELIUM, *ante*. The serous membranes line all the shut or closed cavities, and are of two kinds; those lining the cavities of the thorax and abdomen, the pleuræ (q.v.) and peritoneum (q.v.), and those which line the cavities of the joints. See SYNOVIAL MEMBRANES, *ante*. The third species of simple membrane of Bichat is the fibrous, divided into two sections; enveloping aponeuroses, the fibrous capsules of joints and the sheaths of tendons—and the enveloping membrane of bone, the periosteum, the dura-mater (the internal periosteum of the skull), the fibrous membrane of the spleen and other glandular organs. See SPLEEN, *ante*. The compound membranes Bichat divided into three sections. 1. Sero-fibrous, composed of fibrous and serous layers intimately adherent, as the pericardium, dura-mater, and tunica-albuginea. 2. Sero-mucous, composed of serous and mucous layers, as the gall bladder at its lower part. 3. Fibro-mucous, formed by the union of fibrous and mucous membrane, as the mucous membrane of the nasal fossæ, gums, etc. It will be perceived that the compound membranes

form a classification which embraces elements classed among the simple membranes; and this is natural, seeing that the compound are made up of simple membranes.

MEMBRÉ, ZENOBIUS, 1645–87; b. at Bapaume, France; became a member of the Franciscan order, and went as a missionary to Canada in 1675; accompanied La Salle upon his expedition to the Mississippi in 1679, stopping at fort Crèvecœur, on lake Peoria, where he aided in making peace between the Iroquois and Illinois Indians; descended the Mississippi with La Salle in 1682, and returned the same year to France, where he published an account of the expedition. After acting for a time as warden of a convent at Bapaume, he came again to America, and accompanied La Salle in his final expedition by sea to Texas in 1684, and remained in Fort St. Louis, where, with his companions, he was massacred by the Indians.

ME'MEL, a governmental district of Prussia, forming its most northerly boundary towards Russia, and included in the circle of Königsberg. The chief town, Memel, situated in 55° 43′ n. lat., and 21° 6′ e. long., and lying at the northern extremity of the Kurisches Haff, at its opening into the Baltic, is a well-fortified, active seaport. Pop. '75, 19,796. It has an excellent large harbor, and is the center of an active trade in corn, wood, hemp, and amber; the produce of Lithuania and other Russian provinces being brought thither for exportation. The town itself, which is surrounded by an unproductive sandy plain, possesses several good manufactories for the preparation of brandy, soap, linseed-oil, etc., and extensive saw-mills, iron-foundries, and amber and iron works, the last of which are noted alike for their strong cables and their light and elegant cast-iron goods. Ship-building is carried on at Memel, which owns about 100 ships, and has a good school of navigation; in 1874, 1284 vessels entered, and 1340 left, the port, and steam-packets maintain a communication with many of the other Baltic ports. Memel was founded in 1253 by the Livonian order of knights; in 1404 it was fortified by the Teutonic knights. In consequence of a fire in 1854 it has of late years undergone an almost complete renovation, and is now a clean, well-built town.

MEMLING or HEMLING, HANS, 1435–95 (about) probably a native of Bruges, but very little is known about the date and place of his birth or the time of his death, which could not, however, have been later than 1495. Several other ways of spelling the name are given, but "Memling" has decidedly the best authority. He was, at least, an artist of the Flemish school, if not of Flemish birth, and painted a large number of altar-pieces and pictures on sacred subjects, to which his work was almost wholly confined. It is a matter of great uncertainty to say what were and what were not his productions. Rathgeber designates over one hundred pictures, but very few of these are fully authenticated. The earliest of those which it is thought are genuine is dated in 1450 and the latest in 1491. Memling is said to have served under Charles the bold of Burgundy, and it is related that after the battles of Granson and Morat, he was admitted as a wounded soldier, into the hospital of St. John's, at Bruges. Here it was, at all events, that were painted many of the finest works attributed to him. Of these, the principal are; the illustration in a picture composed of many small compartments, of the history of St. Ursula and her companions; the marriage of St. Catherine, his finest picture, and one of the best of that c., consists of a central composition representing the marriage, and two wings or side pieces, depicting the beheading of John the Baptist and the vision of John the Evangelist. There are many pictures, presumably Memling's, at Berlin, Antwerp, the Hague, and other parts of Europe, and two or three in England. Specially worthy of praise are:—"St. Christopher carrying the Child," "Joys and Sorrows of the Virgin," and "The Journey of the Three Kings from the East." In all of these there is not only great harmony in color and effective use of light and shade, but most noteworthy of all is the wonderful perfection in matters of detail. The last named picture contains nearly 1500 objects and figures of small size, all of which are elaborated in the most minute manner, and this, too, without neglect of general effects.

MEMLOOKS. See MAMELUKES, *ante*.

MEM'MINGEN, a t. of Bavaria, near the right bank of the Iller, 42 m. s.w. of Augsburg. It has handsome streets, carries on manufactures of woolen, cotton, and linen goods, gun-powder, and iron-ware; the chief part of the trade is in hops, wool, leather, and grain. Pop. '75, 7,762

MEMMINGER, CHARLES GUSTAVUS, b. Würtemberg, Germany; and was brought to this country at a very early age by his mother. By her death he was soon left an orphan. Much interest was taken in him by gov. Thomas Bennett of Charlestown, S. C at which place he was then situated. He was educated at the South Carolina college, where he graduated in 1820 and subsequently studied law. He opened practice in Charlestown, where he acquired some note as an opponent of the Calhoun doctrine of nullification; and on that subject he wrote a satirical book which he called the *Book of Nullification* (1832), and which was written in an imitation of Biblical style. He was elected to the state legislature, and made strong arguments in opposition to the suspension of specie payments by the banks after the panic of 1839; and he was for many years head of the legislature finance committee. Shortly after the outbreak of the rebellion he was made secretary of the treasury by the confederate government, and held that position for three years, 1861–64, when he resigned.

MEM'NON, a celebrated hero, the son of Tithonus and Eos or Aurora, who led to Troy a host of Æthiopians, to support the cause of Troy after the fall of Hector. He was said to be clad in armor made by Hephæstus or Vulcan, and killed Antilochus, son of Nestor, in single combat. He was killed in single combat with Ajax or Achilles. Others suppose he was ruler of the nations between Susa and Troy, or a vassal of the Assyrian monarch Teutamus, who sent him with 10,000 Æthiopians, and as many Susians, to the Trojan war. After his death, his corpse was carried by Aurora to Susa, and buried in the acropolis of that town, Memnoneia; or his ashes, collected in a silver urn, borne to his sister Himera at Paphos, and thence to Palliochis or Paltos; or to the banks of the Belos, near Ptolemais. The river Paphlagonios flowed from his blood, and his companions were changed into birds. But the Memnon of the older writers obtained a still greater renown by the name being transferred at a later period by the Greeks to a celebrated colossus, seated in the plains of Thebes, on the left or west bank of the Nile; while the name of Memnoneia was applied by the Egyptian Greeks to the sepulchral quarter of Thebes, as Diospolis was to the right or east bank. Memnoneia, or supposed palaces of Memnon, also existed at Abydos. The two statues—one of which is the celebrated vocal Memnon, one of the wonders of the old world—are at a place called Koum-el-Sultan. Both are seated on thrones, and represent the monarch Amenophis III., of the 18th dynasty, whose name and titles are inscribed on the plinths behind. At the sides of the throne are sculptured the wife and mother of the monarch, about 18 ft. high. The height of each of these colossi appears to have originally been 60 ft., and they are made of a coarse hard gritstone or breccia. They are at present known by the sobriquets of Tammy and Shammy, and were originally placed before the propylon of an Amenopheion or palace-temple of Amenophis III. in this quarter at Thebes. The easternmost of these colossi is the celebrated vocal statue, distinguished from its companion by having been anciently broken and repaired from the lap upwards with blocks of sandstone, placed horizontally, in five layers. The statue was either injured by Cambyses, to whom the Egyptian priests ascribed most of the mutilations of the Theban temples, or else thrown down by an earthquake. The peculiar characteristic of this statue was its giving out at various times a sound resembling the breaking of a harp-string or a metallic ring; and considerable difference of opinion has prevailed as to the reason of this sound, which has been heard in modern times, it being ascribed to the artifice of the priests, who struck the sonorous stone of which the statue is composed, the passage of light draughts of air through the cracks, or the sudden expansion of aqueous particles under the influence of the sun's rays. This remarkable quality of the statue is first mentioned by Strabo, who visited it in company of Ælius Gallus, about 18 B.C.; and upwards of 100 inscriptions of Greek and Roman visitors incised upon its legs, record the visits of ancient travelers to witness the phenomenon, from the 9th year of Nero, 63 A.D., to the reign of the emperor Severus, when it became silent. Amongst other visitors whose names are recorded are those of the emperor Hadrian and his wife Sabina; Septimius Severus also visited the statue, and is conjectured to have restored it; for Juvenal mentions it as broken in half, and no notice of it occurs under the Pharaohs or Ptolemies The identity of this statue and of Memnon is mentioned in the gloss upon Manetho, and by Pausanias and the inscriptions.—Besides the mythical Memnon, two historical personages of this name are known—one a Rhodian commander of the mercenaries of Artabazus in the war against Artaxerxes-Ochus, who subsequently fled to Macedon, and afterwards entering the Persian service, defended Persia against Alexander, 336 B.C.; but finally died at the siege of Mitylene, 333 B.C.: the other, a Greek historian, who wrote a history of Heraclea Pontica, in 16 books, which have been epitomized by Photius—Welcker, *Episch. Cycl.* 211; Strabo, xv. 728, xvii. 816; Ælian, *H. A.*, v. 1; Jacobs, *Die Graeber des Memnon;* Eusebius, *Hieron*, p. 154; Juvenal, xv. 5; Letronne, *Sur le Mon. d'Osymandyas;* Wilkinson, *Top. of Thebes*, p. 33; Vossius, *De Hist. Græc. à Westermann*, p. 226; Diodor. xvi. 52.

MEMORY. This is one name for the great and distinctive fact of mind, namely, the power of retaining impressions made through the senses, and of reviving them at after-times without the originals, and by mental forces alone. The conditions of this power have been already stated (see ASSOCIATION OF IDEAS, HABIT). We shall advert here to some of the arts and devices that have been propounded from time to time, for aiding our recollection in the various kinds of knowledge.

Perhaps the commonest remark on this subject is, that memory depends on attention, or that the more we attend to a thing, the better we remember it. This is true with reference to any special acquisition: if we direct the forces of the mind upon one point, we shall necessarily give that point the benefit of the concentration, but this does not affect memory as a whole: we merely take power from one thing to give it to another. Memory at large can be improved only by increasing the vigor and freshness of the nervous system, and by avoiding all occasions of exhaustion, undue excitement, and other causes of nervous waste. We may do this by general constitutional means, or by stimulating the brain at the expense of the other functions; this last method is, however, no economy in the end. Every man's system has a certain fund of plastic power, which may be husbanded, but cannot be materially increased on the whole; the power being greatest in early life, and diminishing with advancing years. If it is strongly

drawn upon for one class of acquisitions, we must not expect it to be of equal avail for others.

But there may be ways and means of presenting and arranging the matters of our knowledge so as to make them retained at a smaller cost of the plastic power of the brain. These include the arts of teaching, expounding, and educating in general, and also certain more special devices commonly known as the arts of memory, or mnemonics. A brief account of these last may be given here.

The oldest method of artificial memory is said to have been invented by the Greek poet Simonides, who lived in the 5th c. B.C. It is named the *topical*, or locality memory, from the employment of known places as the medium of recollection. As given by Quintilian it is in substance as follows: You choose a very spacious and diversely arranged place—a large house, for instance, divided into several apartments. You impress on the mind with care whatever is remarkable in it; so that the mind may run through all the parts without hesitation and delay. Then if you have to remember a series of ideas, you place the first in the hall, the second in the parlor, and so on with the rest, going over the windows, the chambers, to the statues and several objects. Then when you wish to recall the succession, you commence going over the house in the order fixed, and in connection with each apartment you will find the idea that you attached to it. The principle of the method is that it is more easy for the mind to associate a thought with a well-known place than to associate the same thought with the next thought without any medium whatever. Orators are said to have used the method for remembering their speeches. The method has been extensively taught by writers on mnemonics in modern times. Probably for temporary efforts of memory it may be of some use; the doubtful point always is whether the machinery of such systems is not more cumbrous than helpful.

Much labor has been spent on mnemonic devices for assisting in the recollection of numbers, one of the hardest efforts of memory. The principal method for this purpose is to reduce the numbers to words, by assigning a letter for each of the ten ciphers. This method was reduced to system by Gregor von Feinaigle, a German monk, and was taught by him in various parts of Europe, and finally published in 1812. He made a careful choice of the letters for representing the several figures, having in view some association between the connected couple, for more easy recollection. For the figure 1, he used the letter *t*, as being a single stroke; for 2, *n*, as being two strokes combined; 3, *m*, three strokes; 4, *r*, which is found in the word denoting "four" in the European languages; 5, *l*, from the Roman numeral L, signifying fifty, or five tens; 6, *d*, because the written *d* resembles 6 reversed; 7, *k*, because *k* resembles two 7's joined at top; in place of this figure is also used on occasion *g*, *q*, *c* (hard) as all belonging to the guttural class of *k;* 8, *b*, from a certain amount of similarity, also *w*, for the same reason, and sometimes *v*, or the half *w;* 9 is *p*, from similarity, and also *f*, both of which are united in the word *puff*, which proceeds from a *pipe*, like a 9 figure; 0 is *s*, *x*, or *z*, because it resembles in its roundness a grindstone, which gives out a hissing noise like these letters. The letters of the alphabet not employed in representing figures are to be used in combination with these, but with the understanding that they have no meaning of themselves. Suppose, then, that a number is given, say 547; 5 is *l*, 4 is *r*, 7 is *k;* which makes *l*, *r*, *k;* among these letters we insert an unmeaning vowel, as *a*, to make up an intelligible word LARK, which remains in the memory far more easily than the numerical form. In making up the words by the insertion of the unmeaning or *dumb* letters, we should also have regard to some connection with the subject that the number refers to, as, for example, in chronology. Thus, America was discovered in 1492; the letters here are *t*, *r*, *p*, *n;* they may be made into TO RAPINE, because that discovery led to rapine by the first Spaniards. There is, of course, great room for ingenuity in the formation of these suggestive words. Also, a series of numbers may be joined together in some intelligible sentence which can be easily remembered. Such combinations, however, should be formed once for all in the case of any important series of numbers, as the dates of our sovereigns and other historical epochs. It is too much to expect pupils to construct these felicitous combinations. Feinaigle combined the topical method with the above plan in fixing a succession of numbers in the memory.

Dr. Edward Pick, a recent lecturer on mnemonics, has called attention to a peculiar mode of arranging lists of words that are to be fixed in the memory, as the exceptions to grammar rules, etc. He proposes to choose out such words as have some kind of connection with one another, and to arrange them in a series, so that each shall have a meaning in common with the next, or be contrasted with it, or be related to it by any other bond of association. Thus, he takes the French irregular verbs, which are usually arranged in the alphabetical order (which is itself, however, a mnemonic help), and puts them into the following series, where a certain connection of meanings exists between every two: as *sew*, *sit down*, *move*, *go*, *go away*, *send*, *follow*, *run*, *shun*, etc. In a case where two words have no mutual suggestiveness he proposes to find out some intermediate idea that would bring about a connection. Thus, if the words were garden, hair, watchman, philosophy, he would interpolate other words; thus, *garden*, plant, hair of a plant—*hair; hair*, bonnet, *watchman; watchman*, wake, study—*philosophy;* and so on. Of course the previous method is the one that should be aimed at, as the new words are to a certain extent a burden to the mind. Dr. Pick further suggests as a practical hint, in committing to memory, that the attention should be concentrated suc-

cessively upon each two consecutive members of the series; the mind should pause upon the first and the second until they have been made coherent; then abandoning the first, it should in the same way attend to the second and the third, the third and the fourth, etc. Of course if every successive link is in that way made sufficiently strong, the whole chain is secure.

There are various examples of effective mnemonic combinations. The whole doctrine of the syllogism (q.v.) is contained in five lines of Latin verse; as regards amount of meaning in small compass, these lines have never been surpassed, if, indeed, they have been equaled. The versification of the rules of the Latin grammar has the same end in view, but all that is gained by this is merely the help from the association of the sounds of the verse in the ear; in comparison with a topical memory, this might be called a rhythmical memory. The well-known rule for the number of days in the different months of the year ("Thirty days hath September," etc.) is an instance of mnemonic verse.

MEMORY, DISEASES OF. Memory, or the power of reproducing mental impressions, is impaired by age, wounds, or injuries to the head or nervous system, fevers, intemperance, and various physical conditions. It is perhaps affected in all kinds of mental derangement, but is in a most signal manner obliterated or enfeebled in *dementia*. There are, however, examples of recollection surviving all other faculties, and preserving a clear and extensive notion of long and complicated series of events amid the general darkness and ruin of mind. Incoherence owes some of its features to defective or irregular memory. Cases of so marvelous an exaltation and extension of this capacity, as where a whole parliamentary debate could be recalled, suggest the suspicion of unhealthy action. There appear, however, to be special affections of the faculty. It may be suspended while the intelligence remains intact. Periods of personal or general history may elude the grasp, and even that continuity of impressions which goes far to constitute the feeling of personal identity, is broken up, and a duality or multiplicity of experiences may appear to be conjoined. The converse of this may happen, and knowledge that had completely faded away may, under excitement or cerebral disease, return. There are, besides, states in which this power is partially affected, as in the instances where the numbers 5 and 7 were lost, and where a highly educated man could not retain any conception of the letter F; secondly, where it appears perverted, recalling images inappropriately, and in an erroneous sequence of order or time, and different from what are desired; and thirdly, where, while the written or printed signs of ideas can be used, the oral or articulate signs are utterly forgotten. All these deviations from health appear to depend upon changes generally of an apoplectic nature in the anterior lobes of the brain.—Crichton on *Mental Derangement*, i. 337; Teuchtersleben, *Medical Psychology*, p. 121.

MEM'PHIS, a celebrated Egyptian city, situated in the Delta, or Lower Egypt, the the ancient capital of the country, called by the Egytians *Men nefer*, or "the Good Station;" by the Hebrews, *Moph;* and by the Arabs, *Memf*. It was founded by Menes, the first monarch of the first dynasty, who, according to Herodotus, changed the bed of the Nile, and made an embankment, 100 stadia above Memphis, to protect the new city against inundations. The remains of this bank still exist at Kafr-el Tyat, about 14 m. above Metrahenny, which is the center of old Memphis, and the site of the temple of Ptah or Hephæsteum. Menes fortified the city, and laid the foundations of the temple. Uchoreus, a later monarch, is also said to have founded Memphis, and introduced the worship of Apis and Epaphus. The site of the city was well chosen, protected alike by the Libyan and Arabian chains of mountains against the river and the incursions of the sand, defending the approach of the country from the incursions of Asiatic nomads, and communicating with the Red sea and the Mediterranean. The city was composed of two portions—one built of crude bricks; the other, on which was the citadel, of calcareous stone, called the *Leukon Teichos*, or "White Wall," which held some of the principal buildings. The palace, built by Menes, was enlarged by his son Athothis, and was always inhabited either by a monarch or his viceroy. Under the Persian rule it was occupied by the satrap; and by the Greek mercenaries under the Saite kings. Under Uchoreus the total circumference was 150 stadia. After the 6th dynasty the city declined in importance, and was apparently held by the Hykshos after the 13th and before the 18th (1500 B.C.). At this period Memphis was ruled by a viceroy, a prince of the blood, and still remained the religious capital of the old worship. It rose again to great importance under the Saite monarchs, about 600 B.C., who restored it, became the seat of a separate monarchy, and was conquered by Sennacherib and his successors. The temples of this city were magnificent, and comprised the Iseum, a large temple of Isis, completed by Amasis II. just prior to Cambyses (525 B.C.); a temple dedicated to Proteus, in the foreign quarter; the temple of the Apis, having a peristyle and court ornamented with figures, opposite the south propylæum of the temple of Ptah, where the sacred bull resided; the Serapeum, or temple of Os or Apis, in the quarter recently discovered by M. Mariette (see SERAPEUM); the Nilometer, removed by Constantine I. to Constantinople, replaced by Julian III. or the apostate; a temple of Ra; and the shrine of the Cabiri. Here were the statues of Rameses II., one of which exists as the fallen colossus, Metrahenny, and others have been discovered by Hekekyan Bey in his exca-

vations. These colossi, above 75 ft. high, were of syenitic granite, or of the limestone of Tourah or Mokattam. These temples flourished in all their glory till the Persian conquest. Still more remarkable was the great necropolis of the city, in the center of which towered the pyramids (see PYRAMIDS). During the attempts of the native rulers to throw off the Persian rule, Memphis was an important strategic point. Ochus inflicted severe injury on this town, having plundered the temples and thrown down the walls after he had driven out Nectanebus. Alexander the great here worshiped the Apis, and his corpse was brought to this city by Ptolemy before it was finally transferred to Alexandria. The first Ptolemies were crowned in the serapeum. Ptolemy VIII. destroyed the city, and it had so declined after his time as to become a decayed site. It fell with the rest of Egypt under the Roman rule, and afterwards was conquered by Amru Ben Abas (639–640 A.D.); and Fostat and Cairo were built out of its ruins, which were large and important in the 13th c., when they were seen by Abd-alatif. The few remains of of the ancient city are Koum-el-Azyzeh to the n., Metrahenny on the w., and the canal of Bedrachin on the s.; but the remains here are submerged many ft. in the soil of the Delta.

Thebes*, p. 340; Bunsen, *Egypt's Place*, ii. p. 47; Champollion-Figeac, *L'Egypte*, 35, 63, 205, 286; Lepsius, *Reise*, 20, 51, 63.

MEMPHIS, a city and port of entry on the e. side of the Mississippi river, in the s.w. corner of Tennessee, 420 m. below St. Louis. It is handsomely built on a bluff, 60 ft. above the highest floods. It is the outlet of a large cotton region, receiving, in 1873–74, 429,327 bales. It has fine public buildings and hotels and theater, 48 churches, 3 colleges, 100 schools, 5 daily and 10 other newspapers, 10 banks, and several insurance companies; railways connecting it with New Orleans, Charleston, Louisville, Little Rock, etc.; with several foundries, manufactories of boilers, machinery, etc. In the war of secession it fell into the hands of the federal forces in 1862, and was the base of military operations for the capture of Vicksburg, July 4, 1863. Memphis was desolated by a fearful outbreak of yellow-fever in the summer of 1878. Pop. '70, 40,226.

MEMPHIS (*ante*), capital of Shelby co.; the chief city in Tennessee, and the largest city on the Mississippi river between St. Louis and New Orleans; pop. '80, 33,593. It is situated on the fourth Chickasaw bluff, 800 m. above New Orleans. The view of the city from the river is very attractive; a broad esplanade, extending along the bluff, covered with fine warehouses, presenting a very striking appearance. The streets are broad and regularly laid out, the suburbs being occupied by handsome residences standing in the midst of fine lawns; the entire length of the city is three miles. A fine park in the center is filled with large old trees, in which thousands of squirrels disport themselves, and are so tame that they will eat from the hands of visitors, clamber upon their knees and shoulders, and hop fearlessly about on the graveled walks, regardless of the numbers of persons who are commonly promenading. The safety of these attractive little creatures is amply provided for by the general understanding that they are not to be molested There are six cemeteries in the vicinity of Memphis, of which the principal one is Elmwood, on the s.e. border of the city. There is a local chamber of commerce, a board of health, and a cotton exchange. Railroads centering here make connection with all parts of the country, north and south; while the Mississippi river, affording navigation during the entire year, is the scene of an immense commerce. Owing to its proximity to stagnant water and to an imperfect system of drainage and sewerage, Memphis has frequently been subject to visitations of the yellow-fever, which have nearly depopulated the city. The last epidemic occurred in 1879, lasting from July until cold weather set in. The mass of the inhabitants deserted the city, leaving only the very poor and the colored people. During this season there were several hundred deaths by yellow-fever, an efficient quarantine being sustained. Recent and, it is said, successful efforts have been made to improve the drainage and prevent disease.

MEMPHREMAGOG, LAKE, in Canada and in Orleans co., Vermont; about 30 m. long from n. to s., with a width varying from 2 to 5 miles. Its outlet is the Magog river, which discharges into the St. Francis river, a tributary of the St. Lawrence. Its shores are steep and picturesque, and it contains a number of islands. Its scenery and facilities for fishing attract many visitors in the summer. Steamers run, in that season, between its s. point, the town of Newport, Vt., and Magog, the village at its outlet.

MEN, THE, are a somewhat remarkable class of persons found chiefly in those parts of northern Scotland in which the Gaelic language is spoken, and where large undivided parishes, a deficiency of ministers, and other causes have developed a class of religious instructors and overseers who, without regular appointment, somewhat resemble the local preachers of the Methodist church. They are called "men" as a title of respect, in acknowledgment of their mental endowments, knowledge, and piety. They pass into the order informally, and by the gradual reputation which they acquire among the people around them for superior gifts and experience. By excellence in prayer and exhortation, and by constant attendance at the meetings for promoting Christian activity and fellowship, they step by step advance into the order of "the men." There are in many parishes three or four "men;" and on communion occasions, Friday being specially devoted

to prayer and exhortation, these lay-exhorters have then a public opportunity for exercising their gifts. As there may be 20 or more of them assembled from neighboring parishes, the services of the day are given up to them, presided over by the minister of the parish, who generally sums up the opinions and sentiments that have been expressed. Many of the "men" wear on these occasions a large blue cloak, and in going about among the people they are received with much respect and kindness. The influence which they acquire is very great, and in some cases is grievously abused. Yet these constitute the exception, not the rule. There is no doubt that in many destitute regions these workers among the people have done much to keep alive and extend true religion. Since the organization of the Free church of Scotland, as the supply of regular gospel ordinances in the Highlands has been greatly increased, the need for the services of the "men" has been proportionally diminished, and their influence is therefore passing away.

MENABREA, Luigi Federigo, Count; b. at Chambéry, in Savoy, 1809; educated for an engineer; entered the army as lieut., but was early promoted to a professorship of applied mathematics in the military academy of Turin, where he at once distinguished himself by scientific essays contributed to the academies of science of Paris and Turin. In 1848 he promoted the union of Piedmont and Sardinia; was elected a member of the Subalpine parliament, appointed secretary of the minister of war, and the following year secretary of foreign affairs. After participating in vigorous measures to resist the Austrians, he continued a member of the chamber, assuming at first the defense of the church of Rome, and believing in the possible accord of the papacy with Italian unity. But, through the influence of Cavour, after 1859 he abandoned that hope, and ranged himself with the radical unionists. After the defeat of the Austrians by the French, and the annexation of Savoy to France, he left the province to retain his citizenship of Italy, and was made director of military siege operations against Gaëte and the king of Naples, in "the Sebastopol of the Bourbons." It surrendered after 57 days' siege, for which success he was made lieut.-gen. and count. In 1861 he succeeded Ricasoli as minister of marine, and in 1862 added the duties of minister of public works. He was a party to the convention between France and Austria in 1864, and of the treaty of Prague in 1866, which finally led to the annexation of Venice to Italy; and it was he who presented to Victor Emmanuel the iron crown of Lombardy. He was called in 1867, on the retirement of Ratazzi, to form a new cabinet. Garibaldi was marching upon Rome, to sever the last link in the chain of papal civil power in Italy. France opposed Garibaldi with her troops. Menabrea did the humiliating duty of endeavoring to buy the withdrawal of the French troops, and the substitution of Italian troops, by a promise to disavow the acts of Garibaldi. Occupying this equivocal position of half-sustaining the temporal power of the pope, keeping the peace with France, and yet advocating the unity of Italy, he fell between all the parties and tendered his resignation. Victor Emmanuel refused to accept it. Menabrea formed a new cabinet and continued with adroitness to pursue the road which Cavour had marked out: viz., to submit to the meddling of France in the defense of the pope till events should ripen for Italian unity. He continued at the head of affairs for two years, temporizing with the pope and the republicans, and enduring the policy of Napoleon through fear. When the pope in 1869 convoked the bishops to announce the *syllabus* of infallibility, Menabrea proclaimed the reserved rights of the state as without the pale of the pope's powers. Italy outgrew his timorous policy, and in Nov., 1869, he gave way to the ministry of Lanza-Sella. He has published *République et Monarchie dans l'état actuel de la France*, 1871.

MENA'DO, an important possession of the Netherlands, on the n. of Celebes, is under the government of the Moluccas. The country is volcanic, with many lofty mountains. The mountainous grounds of the province of Minahassa are well adapted for the growth of coffee, which was first planted in 1820, and speedily became favorably known in the market. The coffee-culture is compulsory, and the government monopolizes the produce at a fixed price. In 1874 there were 10,987,200 coffee-trees, which produced 1004 tons. The rice-crop averages 47,880 tons. There are 400,000 sago and 800,000 cocoa-nut trees, and cacao, tobacco, cotton, and cinchona are cultivated. On Jan. 1, 1875, there were 11,626 horses, 19,867 cattle, 201,284 swine, 8,641 buffaloes, and 17,169 sheep and goats. In this residency, civilization and Christianity have made rapid progress. The pop., on Jan. 1, 1873, amounted to 505,756, of whom 777 were Europeans. Twenty years ago, the pagans were most numerous in the Minahassa district, but 77,184 are now Christians. The town of Menado is neatly built, has a church, a school for the children of Europeans, and others for those of natives.

MENAGE, Ægidius, or Giles de, a French lexicographer and linguist, was b. at Angers in 1613. Disliking the profession of an advocate, he renounced it, along with an office under government, which his father had transferred to him, entered the church, and fixed his residence in the convent of Notre Dame. His time was chiefly spent in literary pursuits, in which he acquired a great reputation. He was an extreme pedant, full of prejudices and bitter hostilities. His *Dictionnaire Etymologique de la Langue Française* (Par. 1650; best ed. by Jault, 2 vols. Par. 1750), and his *Origini della Lingua Italiana*, are erudite and valuable works, although they contain many erroneous etymolo-

gies. His poems (Latin, Italian, French, and Greek) are of little worth. He died in 1692.

MENAI STRAIT, which separates the island of Anglesey from the main-land, runs e.n.e. from its southern extremity to Bangor, a distance of 13 m., and there widens out into Beaumaris bay. Its width varies from about 250 yds. to 2 miles. The navigation is hazardous, but the strait is nevertheless much used for the sake of expedition by vessels under 100 tons, and occasionally by some of larger size. At the entrance of the strait, the tides sometimes rise to a height of 30 ft., and the ordinary neap-tide rises from 10 to 12 feet. Communication between Anglesey and the main-land was formerly maintained by ferry-boats at different points; but a suspension bridge was constructed by government in the line of the great Holyhead road, and subsequently railway communication was established by means of the Britannia bridge (q.v.). The scenery on both sides of the strait is mildly beautiful.

MENANDER, the most celebrated Greek poet of the New Comedy, was b. at Athens, 342 B.C. His uncle was the comic poet Alexis; he had Theophrastus for his teacher, and Epicurus for a friend; and the influence of all three is discernible in his style of thought and feeling. Menander was a handsome, light-hearted, and elegant Greek, somewhat luxurious, but not impure in his manners. He was drowned while swimming in the harbor of the Piræus. Menander wrote more than 100 comedies, which were in high repute among his countrymen, at least after death; but we possess mere fragments of them. We know something of their character, however, from the imitations of them by Terence. Pleasant and refined wit, clear, sententious reflection, and a vein of real earnestness at times, are the qualities most apparent in them. The best edition of the extant fragments of Menander is Meineke's *Fragmenta Comicorum Græcorum* (Berl. 1841).

MENARD, a co. in central Illinois, along the Sangamon river, which with Salt creek forms its n. boundary; 300 sq.m.; pop. '80, 13,028. The surface is level, with considerable growth of wood. The soil is fertile, and produces oats, Indian corn, hay, wheat, and potatoes. The Chicago and Alton, and the Springfield and Northwestern railroads pass through it. Co. seat, Petersburg.

MENARD, a co. in n. central Texas, along the shores of San Saba river; 800 sq.m.; pop. '80, 1239. The soil is fertile, and there is a considerable growth of wood. The principal production is cattle. It is a good grazing country, which, as yet, has been little opened to cultivation. Co. seat, Menardville.

MENARD, RENÉ, 1604–61, b. in Paris; sent to Montreal as a French Jesuit missionary in 1640; thence to the Nipissings n. of the lakes; afterwards at Three Rivers. He was at Cayuga in 1656, at Oneida soon afterwards, and remained with the Indians when personal violence and death to the missionaries was frequent among them. In 1658 and 1660 he was with the Ottawas of lake Superior, by whom he was not well treated. His last station was in 1661 at St. Teresa's on Keweenaw bay.

MENASH'A, a village of Winnebago co., Wis., on the Chicago and Northwestern, and the Wisconsin Central railroads, 18 m. n. of Oshkosh; pop. of village, 2,484; of township, 3,107. It has a weekly newspaper, a national bank, and several manufactories.

MENAS'SEH BEN ISRAEL (MANASSEH BEN JOSEPH BEN ISRAEL), 1604–59, b. Spain; went to Holland, when young, with his father, to escape the inquisition. There he was educated, and when but 18 years old succeeded his tutor, the rabbi Uziel, as expounder of the Talmud, and preacher in the Amsterdam synagogue. He now began his *Conciliador nel Pentateucho*, which appeared in 1632, and secured for its author a high rank among Hebrew theologians. A Latin translation of it, by Dionysius Vossius, was published the next year, under the title of *Conciliator*.

MENDÆANS. See CHRISTIANS OF ST. JOHN.

MENCHIKOW, or **MENCHIKOFF**, ALEXANDER DANILOVITCH, a Russian field-marshal and minister of state, was b. at Moscow on Nov. 28, 1672. He was a baker's apprentice, when his intelligent countenance attracted the notice of gen. Lefort, through whose patronage he was taken into the service of Peter the great. He had the good fortune to discover a conspiracy among the czar's guards, and his rapid promotion was secured. He accompanied Peter in his travels to Holland and England, and on the death of Lefort was raised to the post of chief adviser. Menchikow was one of the greatest men of his time, excelling equally as a gen. and a diplomatist; and although totally uneducated, he did much to promote the education of the people, and was a liberal patron of the arts and sciences. On Oct. 30, 1706, he defeated the Swedes at Kalisch; he contributed to some of the czar's other victories; was made a field-marshal on the field of Pultawa; and compelled Löwenhaupt to capitulate with great part of the Swedish army. In 1710 he took Riga; in 1713 he led the Russian troops into Pomerania and Holstein, and took Stettin, but gave it up to Prussia, contrary to the will of the czar. This and his avarice so displeased Peter that he subjected him to a court-martial. He was condemned to death by a majority of voices; but was pardoned on payment of a heavy fine. During the reign of Catharine I. he regained

his influence at court, and, after her death, governed Russia with almost absolute authority in the name of Peter II., whose father-in-law he was just about to become, when he was overthrown by Dolgorouki, and banished to Siberia (Sept., 1727). His immensee states and treasures were confiscated. He died Oct. 22 (Nov. 2) 1729. His great-grandson, prince ALEXANDER SERGEJEVITCH MENCHIKOW, was b. in 1789, and after being long an attaché of legation at Vienna, served in the campaigns of 1812–15, rose to the rank of gen., and after the accession of the emperor Nicholas, was employed both in diplomatic and military services. In the Turkish campaign of 1828 he took Anapa after a short siege, but received so severe a wound before Varna as compelled his retirement. He was afterwards for a time at the head of the Russian navy, and raised it to a high state of efficiency. In March, 1853, he was sent as ambassador to Constantinople, where his overbearing behavior produced a speedy rupture between the porte and the czar, and brought about the Crimean war. In this war he commanded both the land and naval forces of Russia, and displayed the utmost energy in defending Sebastopol. In March, 1855, he was appointed commander of Cronstadt. Menchikow was till his death in 1869 one of the most prominent members of the old Russian party.

MENCIUS. See MENG-TSE.

MENDA'ÑA DE NEY'RA, ALVARO, 1541–95; b. in Spain; emigrated to Peru, and had resided some time at Lima, when his uncle, Lope Garcia de Castro, the viceroy of the country, put him in command of an expedition for purposes of discovery among the islands of the Pacific. With two small ships and 125 men he sailed from Callao Nov. 19, 1567. Among his discoveries was a group of islands which he named "Solomon islands," thus indicating his belief that Solomon obtained from them the gold used in the temple at Jerusalem. Returning to Lima in 1568 he circulated reports of the wealth of these islands, which led, 27 years later, to an expedition for their colonization, of which he took the command. Sailing from Callao April 11, 1595, he discovered another group of islands, which he named the Marquesas, after the wife of the viceroy of Peru, the marchioness Mendoza. Sailing n.w., other groups of islands were visited, but Mendaña died in October without having reached the end of his voyage, which, however, was completed by his widow. Mendaña's narrative of his first expedition is in the imperial library at Paris.

MENDAÑA ISLANDS. See MARQUESAS, *ante*.

MENDE, a town of France, capital of the department of Lozère, on the Lot, in a valley surrounded by high hills, about 70 m. n.n.w. of Montpellier. In the vicinity are numerous villas and gardens. Mende has a cathedral surmounted by two spires, and manufactures serges and other coarse cloths. Pop. '76, 6,239.

MENDELSSOHN, MOSES, an eminent German philosopher, was b. Sept. 7, 1729, at Dessau. From his father, a Jewish schoolmaster and scribe, he received his first education; and in his 13th year proceeded to Berlin, where, amid very indigent circumstances, he contrived to learn Latin and modern languages, and to apply himself to the study of philosophy, into which early readings, chiefly of Maimonides's *Moreh Nebuchim*, had initiated him already. After many years of comparative indigence he became the partner of a rich silk-manufacturer, whose children he had educated. The intimate friend of men like Lessing, Sulzer, Nicolai, he, directly and indirectly, contributed in a vast degree to the extermination of the brutal prejudices against the Jews, and the disgraceful laws with respect to them. On the other hand, he acted in the most beneficial manner on his own co-religionists, by rousing them from the mental apathy with which they regarded in his day all that had not a distinct reference to religion, and by waging fierce war against their own religious and other prejudices. He was also, on account of his immense influence upon them, called another Moses. He died Jan. 4, 1786, and Ramler wrote the following epitaph on him: "True to the religion of his forefathers, wise as Socrates, teaching immortality, and becoming immortal like Socrates." His principal works are, *Pope, ein Metaphysiker* (with Lessing) (Dan. 1755); *Briefe über die Empfindungen* (Berl. 1764); *Ueber die Evidenz der Metaphysischen Wissenschaften*, a prize essay of the Berlin academy, which thereupon unanimously resolved to elect him a member of their body; Frederick the great, however, generally prejudiced against the Jews, struck his name off the list; *Phaedon, oder über Unsterblichkeit der Seele* (Berl. 1767) a dialogue in the manner of Plato; *Jerusalem, oder über religiöse Macht des Judenthums* (Berl. 1783), chiefly in answer to Lavater's obtrusive, sometimes even offensively worded arguments, by which he intended to convert Mendelssohn to Christianity, or to prove that he was a Christian already. Further, *Morgenstunden* (Berl. 1785)—morning conversations with his children and friends, chiefly in refutation of Pantheism and Spinozism. Besides many other smaller Hebrew and German essays, contributions to the *Bibliothek der schönsen Wissenschaften*, edited by Lessing (to whom, in a manner, he furnished the prototype to his *Nathan der Weise*), etc., his translation of the Pentateuch and the Psalms deserves a prominent place. His works have been collected and edited by G. B. Mendelssohn (Leip., 1843–45, 7 vols.).

MENDELSSOHN-BARTHOLDY, FELIX, a German musical composer, son of Abraham Mendelssohn-Bartholdy, the eminent banker, and grandson of Moses Mendelssohn, the philosopher, was b. at Hamburg, Feb. 3, 1809. His father was a convert to Christianity,

and young Felix was brought up in the Lutheran faith. The affluent circumstances of his parents enabled them to bestow a most liberal and careful education on their son, whose fine genius early showed itself. Zelter was his instructor in composition, Ludwig Berger on the piano. In his ninth year he gave his first public concert in Berlin, and in the following year played in Paris. From this period he commenced to write compositions of all sorts, some of them of a very difficult character, for the piano, violin, violoncello, etc. In 1824 the first of these—three quartets for the piano—were published. In 1825 he went a second time to Paris—his father, on the advice of Cherubini and other eminent artists, having consented that he should devote himself exclusively to music. He now gave concerts both in Paris and Berlin, after which he traveled for three years in England, Scotland, France, and Italy. In the first of these countries he obtained enthusiastic applause by his overture to Shakespeare's *Midsummer Night's Dream*, which, in its blending of the fanciful, the delicate, and the grotesque, is said to have caught the inspiration of Shakespeare himself. He afterwards wrote music to accompany the whole of the play. His *Isles of Fingal* is a fine memorial of the impression left upon him by the wild scenery of the western Highlands. His letters from Italy also show how profoundly he was affected by that glorious land—the true home of art. Mendelssohn subsequently attempted to start a musical theater for the cultivation of high art, at Düsseldorf, but it did not succeed. In 1835 he accepted the directorship of the Leipsic concerts. Here he was in the center of the musical world of Germany, and was stimulated to his highest and most brilliant efforts; yet it was in England that Mendelssohn first met with a reception proportionate to his genius. His oratorio of *St. Paul*, after being performed at Dresden and Leipsic, was produced under his own management at the Birmingham festival, Sept. 20, 1837, and created quite a furor. It and his other oratorio of *Elijah*, on which he labored for nine years, and which was first brought out at the Birmingham festival of 1846, are reckoned his two greatest works. He died at Leipsic Nov. 4, 1847. Among his best-known compositions are his music for Goethe's *Walpurgisnacht*, the *Antigone* and *Œdipus* of Sophocles, *Athalie*, and a great number of splendid sonatas, concertos, trios. In his *Leider ohne Worte* (songs without words), he has achieved a great and novel triumph. Mendelssohn's character, which was even finer than his genius, is charmingly delineated in his *Letters* which have been translated from the German by lady Wallace (London, 1862).

MENDES, a city of ancient Egypt in the delta Parvum, and near the coast. It gave name to the Mendesian district, and was its chief city. It was near the point where the Mendesian arm of the Nile enters the lake of Tanis. It was a place of importance in the time of the Pharaohs, and noted for the manufacture of a perfume called *Mendusium unguentum*. The deity there worshiped was in the form of a goat, and called Pan by the Greek writers. Mendes gradually disappeared from history, being in ruins in the 1st c. B.C., but in its vicinity arose the city of Thmius.

MENDEZ-PINTO, FERNAM, 1510-83, b. Portugal; at first a servant to a gentleman in Portugal. He sailed for the East Indies in 1537, in the hope of making a fortune. The ship on which he embarked was captured by the Turks, and he was sold a slave. Finally, by the good offices of the governor of Ormus, who had redeemed him from slavery, he was enabled to go to India, where he remained for many years. He returned to Portugal, in 1558. He wrote an account of his travels, which was published in 1614, and translated into French in 1654. It contains much curious information in regard to the geography and social condition of the east; but it indicates great credulity or a want of veracity on the part of its author.

MENDICANCY. (See POOR AND POOR LAWS, *ante*.) Mendicants are practically all persons who gain a livelihood by beggary; a definition excluding those who are willing to work but cannct, owing to lack of demand for labor; and those who temporarily receive assistance because of ill-health or other misfortune. The class we are considering does not exist in uncivilized or savage society. Yet among the least highly civilized we find it flourishing—as in Egypt, and in the case of the lazzaroni of Italy. In large cities mendicancy has become an art, and professional beggars are found in London, Paris, and New York, who have amassed large sums of money by the constant pursuit of a trade which with them has ceased even to be precarious. While we may possibly, with some degree of justice, find the origin of professional beggary in the course not only pursued by, but enjoined upon the orders of, mendicant friars in central and southern Europe, it is certain that the concentration of wealth, the decline in the value of money in the minds of those by whom it has been easily obtained, and the consequent habit of lavish giving, must eventually have brought this condition into being, even though the church had not encouraged its establishment. Twenty-five years ago (1855) it was said by an English writer that a three days' rain about London would at any time bring 30,000 coster-mongers, or venders of provisions, to the verge of famine. This is suggestive. The precarious character of the vocation of many of the lower classes of laboring people, and the imminent danger in which they constantly are, must be a grave temptation to the pursuit which we are considering. In thickly settled towns and cities the chances of gaining the necessities of life are certainly greater in this line than in many trades. It is not liable to the fluctuations occasioned by fashion, or changing taste; by the influence of the seasons; or by the other numerous

vicissitudes which deprive ordinary trades of the element of certainty of return. The professional beggar is not limited to any special range, but may vary his hunting-ground by necessity, caprice, or accident, and be equally certain of success. Also there are peculiar attractions in mendicancy for the uneducated and unskilled, yet not lawless portion of a population, in its comparative freedom from restraint; its opportunity for roving, and for a wild companionship with congenial spirits, precluded by the social order of a regular business life; and, finally, the charm and satisfaction which it offers, of gaining something for nothing; of living on humanity without labor yet without crime; of satisfying the stern natural sense of justice which exists in the bosom of the unfortunate and the indigent, by making the rich support the poor—yet without compulsion. It may also be considered as one of the compensating forces of the social organism, occasioned by the reaction from extreme wealth to extreme poverty, and formulated in an unreasonable demand, answered by a groundless concession; in fact a humanitarian paradox.

The difficulty of dealing with poverty justly, and with a due sense of its various causes and results, has been a social problem ever since there has been any society; and quite the most difficult part of this problem to handle wisely, or to control at all, has been mendicancy. The same English writer to whom we have already referred, in writing generally on the charities and poor of London, says: "But the great problem which perplexed our ancestors less than ourselves, only because in a less crowded state of society social evils were more easily dealt with, was mendicancy. In every community there must always be some who cannot dig, and in the most primitive there are always some who will not, and are not ashamed to beg. From the earliest times the sturdy mendicant has constituted himself the representative of the poor, in whose behalf the Gospel pleads so authoritatively. In that character he lounged at the convent-grate, he devoured his dole at the baron's hall-door, he clamored for alms at the church-porch, and in that capacity we presume he is accepted by the modern advocates (happily few in number) of indiscriminate alms-giving. But even in the most picturesque times, when he pretended to show the scallop-shell from the holy land in his hat, or perhaps the scars of infidel sabers on his body, he was but a good-for-nothing vagabond." The enactment of the poor-law in queen Elizabeth's reign has been attributed to a necessity occasioned by the dissolution of the convents, which were supposed to feed the poor to such an extent as to make the necessity when they ceased to exist. That this was not true is shown by the fact that acts for the suppression of mendicancy were passed before the dissolution of the monasteries. The act of Elizabeth was passed from a desire to effect a social reform, and similar acts were passed in succeeding reigns down to the present, and for the same reason. But though from time to time acts against able-bodied paupers were multiplied, the vagrant continued to prefer idleness and independence to work or the poor-house, and by degrees the number of beggars swelled, till they exceeded the powers of the beadle and constable to arrest, and of the jail or poor-house to contain, and actually acquired an almost legalized existence. At the close of the great European war the evil had reached its height; ostentatiously loathsome objects paraded the great thoroughfares; professional beggars, by a police of their own, quartered the towns among them, and in 1818 an association was formed in London to accomplish what the state had failed in doing. This organization took the name of the society for the suppression of mendicity. A large staff of paid agents was engaged, and the committee for its management counted among its members many naval and military men, trained to habits of order and system; and who, being without professional employment, brought their administrative talents to the service of the new society. This organization did good work, and was the foundation of methods which have since been applied with success; and mendicancy has largely diminished. The reform movement in England in 1834, and new legislation, still further lessened the evil; yet so acute and well informed an observer as the rev. Charles L. Brace says that "the conclusion of all European experience is that nothing can permanently affect the evil of mendicity but a general diffusion of prosperity, morality, and intelligence," certainly affording a gloomy outlook for the future, both in Europe and America; since concentration of wealth, rather than its diffusion, seems to have become the order of society; and the probability of general "prosperity, morality, and intelligence," in the face of that tendency, is, to say the least, remote.

The theory held by many that pauperism bears a direct relation to the price of corn would seem to have been practically disposed of by the statistics of the sums expended in relief from 1813 to 1860 in England. By these it is seen that while there was a steady decline in the amount from about £6,650,000 in 1818 to £5,550,000 in 1859, the difference of 20 per cent was far less than it should have been to sustain the theory. For the price of corn had fallen during the 46 years, from 125s. per quarter to 42s. 9d., or sixty-six per cent. And this fact goes far to sustain the assertion that pauperism, and equally or even more, mendicancy, rely for their fluctuations in degree upon causes outside of all such material considerations.

The history of mendicancy in France attests the antiquity of the profession, and offers some pertinent facts. Thus, as early as the middle of the 14th c., in the reign of king John, it was found necessary to issue an ordinance commanding all able-bodied beggars to find work or leave Paris, with the alternative of imprisonment, the pillory, and brand-

ing, according to the number of offenses against the law. A similar act was passed in 1413; but Francis I. rescinded both, and instead directed the public authorities to set those persons indicated to work, if necessary by force. But it was found that severe laws had but little effect in suppressing the evil; and though in 1627 beggars were directed to be impressed into the naval service, and even expatriated by being sent to the Indies, work-houses were established in France, and thus a new system was begun. In 1688, all previous plans having failed, a law was enacted forcing every beggar to leave Paris, on pain of being sent to the galleys. Even this harsh measure was incompetent to relieve the city of mendicants, much less the entire kingdom; and in 1698 it was estimated that one-tenth of the entire population were beggars. The work-house plan was now tried again, and in four years 80 of these were established. These institutions not only did not succeed in rooting out the evil, but they were found to be, instead of self-supporting, as was anticipated, a severe tax on the state. They were gradually suppressed, and at present very few exist. Mr. Brace remarks as to the various French methods: "Thus, during five centuries every species of penalty and punishment has been tried in vain in France to repress mendicity. Humane legislation has been equally a failure; and the sum of all experience in that country is that all legal means fail to reach this great evil." But the fact is that there is less mendicancy, as there is less pauperism in France, in proportion to its population, than there is in any other country in Europe, or in the United States. And it would appear that to seek for the cause of this fortunate condition we must analyze the effect of the French land laws. For the fact that in France, where there is no law of entail for landed property, and where a father cannot by will alienate this species of property in any one direction; but where, on the contrary, land is divided among all the heirs, on the death of the owner,—there must of necessity be such a subdivision of land that the existence of pauperism on a large scale becomes practically impossible: the result being that the land is divided among a larger number of owners than is the case with any other country. Another and curious reason for the condition of France as regards pauperism is found in the fact of the apparently stationary condition of her population. Between 1851 and 1876 the population increased only about 3 per cent, and was nearly what it was in 1870. The birth-rate in France is only 26 in a thousand, being far below that of any other country. An ingenious Frenchman bases on this condition the positive prosperity of his country, on the ground that the number of non-producers is lessened, and so much less drain on the resources of the country for their support is the result.

The record of pauperism and mendicancy in the United States has been similar to that of England in its general conditions. The class of beggars in the large cities and towns has been supplemented by that of "tramps." These are comparatively recent in their origin in the United States; and it is not improbable that they were originally an exportation from England, where they have long been a feature of pauperism. They have increased greatly in number in recent years, and in Massachusetts alone there were said to be a few years ago 25,000 of these peripatetic beggars. It is certain, also, that they are to a certain extent organized, that they associate with each other, and that they communicate by signs and marks placed where they can be found by the initiated. The proportion in Massachusetts applied to the entire population would give 750,000 as the number of tramps in the entire country, or one in 66. In England, in 1867, the number of tramps was returned, on a certain specified night, at 33,191—very little more than the number in Massachusetts alone, and in the proportion of 1 to 666. Various efforts have been made in the United States in the special direction of reducing the number of tramps, culminating in the passage of severe "tramp laws" in Massachusetts and a few other states. These laws are of very recent enactment, and their effect has not yet been made known. It is probable that unless similar legislative action took place in all the states the effect would be only to drive them from one state to another.

MEN'DICANT ORDERS, certain religious associations in the Roman church, which, carrying out the principle of religious poverty and self-humiliation to its fullest extent, make it a part of their profession to denude themselves of all property, whether real or personal, and to subsist upon alms. As the scriptural foundation of this practice, the words of our Lord (Matt. xix. 21) to the young man who sought counsel of him, and again (verses 27–30) to his own disciples, are commonly alleged, both by the mendicant orders and in general by all who profess what is called evangelical poverty. In the mendicant orders alms are commonly collected by the lay-brothers; in some, by actual solicitation; in others, by the ringing of the convent bell when the stock of provisions is exhausted. Formerly such orders were numerous in the church; but by a decree of the second council of Lyons in 1274 the mendicant orders were limited to four—the Dominicans, Franciscans, Carmelites, and Augustinians or Austin friars. See these articles, also FRIARS. The rule by which individuals are denied the possession of even personal property is strictly understood in Catholic countries. In England and Ireland it was considerably relaxed, but of late years has been enforced with increasing exactness.

MENDIP HILLS, a range in the northern part of Somersetshire, England, extend in a n.w. and s.e. direction, and are about 25 m. in length by from 3 to 6 m. in breadth. In former times the moors of Mendip were attached to the crown as a royal forest, and were frequently hunted over by the Saxon and Norman kings. A considerable portion

of the range is now under cultivation. The summit is Black down, 1100 ft. in height. The lead and calamine mines of Mendip (called *grooves*, the miners being called *groovers*) were in operation before the dawn of history.

MENDIZABAL, JUAN ALVAREZ Y, 1790–1853; b. in Cadiz; son of a Jew, brought up in trade, placed in a bank, where he quarreled with the principal, and first noted as a politician in connection with the republican movement in Spain between 1819 and 1823; for which he obtained in England timely loans. In 1824, banished from Spain, he established a commercial house in London; was the medium of a loan to Dom Pedro in 1827, to Spain in 1833, and was recalled in 1835 by Toreno to take charge of the department of finance. He returned to Spain with the *éclat* of a completed loan of £1,150,000, made in London. After great boasts of what he would do, followed by small results, he was displaced in May, 1836, and, though twice called back to the portfolio of finance, was not afterwards distinguished.

MENDOCI'NO, a co. in n.w. California, having the Pacific ocean for its w. boundary, the Mayacmas mountains for its s.e., and the continuation of the Shasta mountain range for its e. boundary; 3,650 sq.m.; pop. '80, 12,800—10,393 of American birth, 1613 colored. It is drained by the Eel river and the South Fork in the e., the Russian river in the s., and the Novarro river. Its surface is mountainous, furnishing good grazing pastures, and is diversified by lakes, fertile valleys, and immense forests of redwood, used for building-timber, grow along the coast. Its soil is very fertile, and adapted to the production of grain, fruit, and dairy products. Horses and cattle are raised, and large numbers of sheep. Wool and lumber are the chief products. It has several excellent harbors. County seat, Ukiah.

MENDO'TA, a village of La Salle co., Ill., at the junction of the Chicago, Burlington and Quincy, and the Illinois Central railroads. Pop. of village, exclusive of township, 1043. It has 2 churches, 2 graded public schools, a library, 2 banks, an iron foundry, an organ manufactory, and a weekly newspaper.

MENDOZA, a province of the Argentine confederation, South America, along the e. of the Andes, bounded on the n. by the province of S. Juan, on the e. and n.e. by S. Luis, on the s. and s.e. by Buenos Ayres, and on the w. by Chili; about 34,000 sq.m.; pop. about 65,000. The w. part of the province is traversed by a part of the Andes chain, from which the surface slopes down to the Mendoza river, at which a great plain begins to stretch eastward. This plain is sandy, but with proper irrigation produces good crops of barley, maize, wheat, and lucerne. Apart from the cereal crops the chief productions are wines, brandy, tallow, and soap. Hides and dried fruits are exported to Chili. There are a few silver mines, and copper is known to exist in quantities, but the veins have not as yet been worked. There are extensive saline deposits; and shales, slates, gypsum, and limestone are found. Rain and dew are infrequent, except along the s. boundary; elsewhere artificial irrigation has to be resorted to, as even grass will not grow on the e. plains without it. Mendoza is one of the federal states of the Argentine republic, but practically manages its own affairs by means of a governor and an assembly. The capital of the province is Mendoza, built on a plain, 2,891 ft. above the level of the sea. Pop. about 10,000.

MENDO'ZA, the capital of a department of the same name in the Argentine republic (q.v.), is situated on the eastern base of the Andes, 110 m. e.n.e. of Santiago, and at a height of 2,891 ft. above sea-level. It was totally destroyed by an earthquake in 1861, when its buildings were demolished, and most of its inhabitants, 15,000 in number, perished; but it is rapidly recovering.

MENDOZA, ANTONIO DE, 1495–1552; b. Granada; was appointed viceroy of México by Charles V. April 17, 1535, invested with full power of rule. In the administration of the government he made many wise and benevolent reforms, especially in regard to the Indians who had been the victims of much suffering. In 1536 he introduced into the city of Mexico the first printing-press brought to the country; established a mint, at which the first coining, in the same year, was done by his orders; promoted agriculture and developed the mining wealth of the land, and founded the first college there. He repressed a serious Indian revolt, wisely tempering rigor with justice. In 1551 he was transferred to the viceroyalty of Peru. He was the first of 64 viceroys in Mexico, and his government was the longest and most distinguished of all.

MENDOZA, DON DIEGO HURTADO DE, a Spanish classic, distinguished also as a statesman and a gen., was b. at Granada about 1503, studied there and at Salamanca; and shortly after leaving the latter university was sent by the emperor Charles V. as ambassador to Venice. Later, he was present at the council of Trent as imperial plenipotentiary, and in 1547 was appointed ambassador to the papal court. As a gen., he was successful in subjugating Siena, which was handed over to Cosmo I. Medici, as a fief of the Spanish crown. His position, however, was a difficult one; he was hated both by pope and people, and in 1554 the emperor recalled him. During his residence in Italy he showed the greatest zeal in collecting literary treasures, especially ancient MSS. He sent learned men for that purpose to Mount Athos, and also took advantage of the regard entertained for him by Soliman the magnificent, sultan of Turkey. In 1568 an affair of gallantry terminated in his banishment from court. He withdrew to Granada, where he

spent his last years in writing his *Guerra contra los Moriscos* (history of the war against the Moors—first published—with parts omitted—in 1610, and in a complete form in 1776, by Portalegre, who prefixed a life of the author). This work is regarded by Mendoza's countrymen as a masterpiece. Mendoza died in 1575. His library is now one of the ornaments of the Escurial. In his poetical epistles he gave his country the first good model for that form of composition. His sonnets and serious poems are of inferior merit.

MENDOZA, IÑIGO LOPEZ DE, Marquis of Santillana, 1398–1458, b. Spain; son of the grand admiral of Castile, and grandson of the poet Pero Gonzalez Mendoza. His father died during Iñigo's infancy, and the family estates, the most extensive in Castile, were seized by the ruling nobles of the kingdom. But Iñigo recovered them, either in the courts or on the field, before he was out of his minority. He took a prominent share in the military and political affairs of Castile, and was created marquis of Santillana after the battle of Olmedo. After the fall of the constable Alvarado de Luna, Mendoza retired from public affairs, and devoted himself to literature. His poetry is largely unpublished, though some of it is contained in different collections of songs. He was familiar with Italian and Provençal literature, and many of his most charming poems show the effect of Provençal influence. He introduced the sonnet into Spain, but his own sonnets are of little value. He imitates Dante, in his poems on the death of the marquis of Villena and on the coronation of Jordi. The most important of his poetical works is the *Comedieta de Ponza;* his most pleasing poem is called a *Serranilla,* or little mountain song, and was composed in honor of a little shepherdess, "the milkmaid of sweet Finojosa." In Spain itself his *Refranes,* a collection of rhymed proverbs, is his most popular work. His principal though perhaps doubtful service to Spanish poetry was his introduction of allegory into poetical composition.

MENDOZA, JUAN GONZALES DE, 1540–1617; b. Toledo, Spain; of a wealthy and distinguished family. He joined the army, but resigned after some years to enter the order of St. Augustine; was sent by Philip II. to China in 1580, where he spent three years in gaining information as to the politics, commerce, manners, and customs of the country. He spent two years in Mexico before returning to Spain. He published an account of his observations in China in a work entitled *Historia de las Cosas mas Notables Ritos y Costumbres del Gran Reyno de la China.* An English translation appeared in 1588, and it was reprinted by the Hakluyt society in 1853–54. Father Mendoza was successively bishop of the Lipari islands, vicar-apostolic of Mexico, and bishop of Chiapas and of Popayan, New Granada, where he died.

MENDOZA, PEDRO DE, 1487–1537, b. Spain; an official in the service of Charles V. In 1535 he went on a voyage to South America for the purpose of exploring the south of that continent, and with authority to take possession of and colonize it in the name of Spain. Made governor of the territory he was to conquer, he left Spain with a fleet of 12 ships, containing 800 men. At Rio Janeiro, Osorio, the vice-admiral, was murdered by some of his subordinates. Mendoza then sailed up the Rio de la Plata, and laid the foundations of the city of Buenos Ayres, where he established a colony. His brother, Gonzalo, went to Paraguay and founded Asuncion in 1536. The colony at Buenos Ayres did not prosper from the first. Aside from the privations to which the colonists were exposed, and the mortality incident to a community not yet accustomed to a new climate, the settlement was constantly attacked by the neighboring Indian tribes, and brought to the verge of destruction. Mendoza, after many disappointments, died on his voyage back to Spain.

MENELA'US, in ancient Greek legend, was king of Lacedæmon, the younger brother of Agamemnon, and husband of the famous Helen. The abduction of his wife by Paris is represented as the cause of the Trojan war. After the fall of Troy he sailed with Helen for his own land; but his fleet was scattered by a storm, and he wandered for eight years about the coasts of Cyprus, Phenicia, Ethiopia, Egypt, and Libya. After his return he lived at Sparta with his wife Helen in great style and happiness.

MENENDEZ DE AVILES, PEDRO, 1519–74; b. at Aviles, Spain. Educated to the sea, he for many years commanded a privateer which was the terror of the French corsairs. By Philip II. he was given a commission in the regular navy and made capt. gen. of the India fleets. In this position he won important victories over the pirates, and was of great service in successfully transporting to Philip the reinforcements which carried the day at the battle of St. Quentin. On June 29, 1565, he sailed from Cadiz with a fleet of 34 vessels with the intention of founding a colony in Florida, of which he had been appointed *adelantado.* The French Huguenots had already established a foot-hold near the mouth of the St. John's river, under the leadership of Ribault. The Spaniards were by far the most powerful in numbers and equipments, and in the ensuing contest the main French stronghold, fort Caroline, was captured, many of the colonists were massacred, and when those who had escaped to the ships of Ribault were wrecked and in a starving condition, Menendez received their surrender, promising to spare them; but, with a treachery and cruelty almost beyond belief, violated his plighted word and slew nearly all of them. Many were hanged and left bearing inscriptions stating that they were killed "not as Frenchmen, but as heretics." When, soon after, the atrocity

was avenged by the French adventurers under Dominique de Gourgues, the Spaniards were hung upon the same trees, with placards stating that they were executed "not as Spaniards, but as cut-throats and murderers." It was in this expedition that St. Augustine was discovered and named. Other posts were established by Menendez further up the coast, as at cape Canaveral and Port Royal. Menendez returned to Spain, but still controlled the affairs of the new colonies. In 1572 he again visited the western continent and carried his explorations still further. He was recalled and ordered to the command of a fleet to be employed in the war with the Low Countries; but died at Santander while engaged in fitting out his vessels.

ME'NES, the first king of the first Egyptian dynasty, who built Memphis, made foreign conquests, introduced luxury, and was subsequently devoured by a hippopotamus. During his reign there was a revolt of the Libyans. His name marks a great chronological epoch, being placed by chronologists 3643, 3892 B.C., or even 5702 B.C. Stricter chronologists make his accession 2717 B.C. This name, which signifies the conductor, has been found on inscriptions, but no contemporary monuments of him are known.—Bunsen, *Egypt's Place*, ii. p. 579; Lepsius, *Königbuch, quellentaf.*, p. 5; Böckh, *Manetho*, p. 386; Poole, R. S., *Hor. Ægypt*, p. 219.

MENFI, or MENFRICI, a t. of Sicily, in the province of Girgenti, 43 m. s.s.w. of Palermo, crowns a long bare height, about 3 m. from the coast. Pop. 9,900.

MENGS, ANTON RAFAEL, a modern German artist and writer on art, b. at Aussig, in Bohemia, Mar. 12, 1728. His father, Israel Mengs, was himself a painter, but possessed of very mediocre talent, and from him young Rafael received his first instructions in art. At the age of thirteen he went to Rome, where he remained three years, rigorously devoting his whole time to the study of the works of Michael Angelo, Raphael, and others of the old masters. On his return to Dresden in 1744 he was appointed court-painter to Augustus III., king of Poland and Saxony, but received permission at the same time to go back to Rome. Here he established his reputation by a picture of the "Holy Family." The young peasant-girl who sat for the Virgin so charmed the painter by her beauty that he subsequently passed over to the Roman Catholic church, and married her. In 1754 he accepted the presidency of the newly instituted academy of painting at Rome. Within the next few years he executed the frescos in the church of San Eusebio, and those of "Apollo and the Muses on Parnassus" for cardinal Albani; besides which he copied Raphael's "School of Athens" for lord Percy, and painted several original pictures in oil, among which may be mentioned a "Cleopatra," a "Holy Family," and a "Magdalene." In 1761 he went to Madrid, on an invitation from Charles III. of Spain, and while there executed a great variety of works, the best-known of which is his "Aurora;" but ill-health and the intrigues of enemies induced him to return to Italy. He had no sooner arrived than Clement XIV. employed him on a large allegorical subject for the Vatican library, representing Janus dictating to History, who appears in the act of writing. After three years he again visited Spain. To this period belongs his most celebrated effort; it represents the apotheosis of the emperor Trajan, and is executed on the dome of the grand saloon in the royal palace at Madrid. Ill-health, however, again forced him to leave Spain. On his way back to Italy he stopped at Monaco, where he painted his picture of the "Nativity," reckoned by many to be his finest piece. Shortly after reaching Rome he died, June 29, 1779. Mengs's works are careful and elaborate imitations of the great masters. He borrowed the technical qualities of a painter in high perfection, but the living soul of genius, the quickening and creative power of imagination, was not his. His works, therefore, though lofty in their subjects, seldom exhibit more than a correct and cultivated taste. Mengs's writings were edited in Italian by Azara in 1780. There is an English translation (Lond. 1796).
